1. Bring the application named above to the front and confirm that no unrelated window has focus.
2. Read the starting condition and compare it with what is visible on your screen.
3. Perform only this immediate task: Open the volume. Create or upload the exact extraction folder EXT- . . . , preserving subfolders sqlserver, postgres, and files, plus batch_manifest.json. If the UI cannot upload a folder recursively, create the subfolders in the volume browser and upload files in groups. Do not flatten filenames.
4. Pause while the application finishes the operation; do not click the same control twice.
5. Inspect the visible result before changing another file, object, or setting.
6. Record the actual result in the verification field for this action.

Command or code:

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

Where to enter it:

pgAdmin 4 or PostgreSQL psql, as named in the action. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

What each part means:

Step 5

Action

Open the volume. Create or upload the exact extraction folder EXT- . . . , preserving subfolders sqlserver, postgres, and files, plus batch_manifest.json. If the UI cannot upload a folder recursively, create the subfolders in the volume browser and upload files in groups. Do not flatten filenames.

Before continuing

☐

I used the application named in this phase.

☐

I confirmed the current folder/database/catalog/schema.

☐

I can describe what changed on the screen or filesystem.

☐

I know which later verification proves this step worked.

What should happen:

A visible file, folder, branch, connection, table, notebook, task, relationship, measure, visual, or verification result should appear exactly where the action predicts.

Expected example:

Your exact values may differ. The expected result is the same *type* of object and the same required status, not necessarily the same timestamps, row counts, colors, generated IDs, or screen dimensions.

What may look different:

Menu wording can vary by product release or account tier. Use the official-source register and look for the described object rather than guessing from an old screenshot.

How to verify success:

Reopen or refresh the relevant panel, locate the named object, and inspect the property or output that proves it exists and is in the intended location.

Do not continue unless:

You can point to the visible result and explain what it proves. Mark the action VERIFIED BY USER only after that check.

Common mistake:

Combining several clicks or decisions, choosing a similarly named object, or continuing because no error dialog appeared.

Exact recovery:

Stop at the current screen. Save a screenshot of the error if useful, hide sensitive values, and compare the selected location with the starting condition. Use Back or Cancel rather than Delete or Overwrite. Correct one mismatch and repeat only this action.

What you just accomplished:

You completed one observable piece of the Northstar Retail platform and established a checkpoint that can be audited later.

How this connects to the project:

The resulting object, decision, or evidence becomes an input to the next stage in the source-to-consumption chain.

[Back to the Phase 8 lesson index](#)

Action 8.2.6 — Open . Choose (or current equivalent). Enter the public repository URL, GitHub provider, and feature branch. F

Application:

Databricks workspace in a web browser

Window or panel:

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

Starting condition:

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Open . Choose (or current equivalent). Enter the public repository URL, GitHub provider, and feature branch. F. This is one bounded construction or inspection task.

Why this action comes now:

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

Exact physical actions:

1. Bring the application named above to the front and confirm that no unrelated window has focus.
2. Read the starting condition and compare it with what is visible on your screen.
3. Perform only this immediate task: Open **Workspace**. Choose **Create > Git folder** (or current equivalent). Enter the public repository URL, GitHub provider, and feature branch. For write/pull operations, configure Git credentials through user settings according to current official docs; do not paste a token into a notebook.
4. Pause while the application finishes the operation; do not click the same control twice.
5. Inspect the visible result before changing another file, object, or setting.
6. Record the actual result in the verification field for this action.

Command or code:

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

Where to enter it:

Databricks workspace in a web browser. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

What each part means:**Step 6****Action**

Open **Workspace**. Choose **Create > Git folder** (or current equivalent). Enter the public repository URL, GitHub provider, and feature branch. For write/pull operations, configure Git credentials through user settings according to current official docs; do not paste a token into a notebook.

Before continuing☐

Your exact values may differ. The expected result is the same *type* of object and the same required status, not necessarily the same timestamps, row counts, colors, generated IDs, or screen dimensions.

What may look different:

Menu wording can vary by product release or account tier. Use the official-source register and look for the described object rather than guessing from an old screenshot.

How to verify success:

Reopen or refresh the relevant panel, locate the named object, and inspect the property or output that proves it exists and is in the intended location.

Do not continue unless:

You can point to the visible result and explain what it proves. Mark the action VERIFIED BY USER only after that check.

Common mistake:

Combining several clicks or decisions, choosing a similarly named object, or continuing because no error dialog appeared.

Exact recovery:

Stop at the current screen. Save a screenshot of the error if useful, hide sensitive values, and compare the selected location with the starting condition. Use Back or Cancel rather than Delete or Overwrite. Correct one mismatch and repeat only this action.

What you just accomplished:

You completed one observable piece of the Northstar Retail platform and established a checkpoint that can be audited later.

How this connects to the project:

The resulting object, decision, or evidence becomes an input to the next stage in the source-to-consumption chain.

[Back to the Phase 8 lesson index](#)

Action 8.2.C1 — Windows PowerShell

Application:

Windows PowerShell or the VS Code PowerShell terminal

Window or panel:

Windows PowerShell

Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Run one explained Powershell instruction and inspect its result before any next command is introduced.

Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

Exact physical actions:

1. CLICK: Bring **Windows PowerShell or the VS Code PowerShell terminal** to the front.
2. LOOK FOR: Confirm the current location matches The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

Command or code (Powershell):

```
$BatchId = 'EXT-YYYYMMDDTHHMMSSZ'; Get-Content "datasets\raw\$BatchId\batch_manifest.json"
```

Where to enter it:

Windows PowerShell. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

What each part means:

- **Line 1:** `$BatchId = 'EXT-YYYYMMDDTHHMMSSZ'; Get-Content "datasets\raw\$BatchId\batch_manifest.json"` — `$BatchId` is a variable or environment-value reference rather than literal output; `=` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `'EXT-YYYYMMDDTHHMMSSZ'` is a quoted literal; the quotation marks preserve spaces or mark text; `Get-Content` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `"datasets\raw\$BatchId\batch_manifest.json"` is a path, relative location, branch-style name, or file argument; verify every character before running it

Does it change anything?

This is intended to inspect or validate state rather than change it.

Is it safe to rerun?

Normally safe to rerun because it is observational, but still confirm the execution location first.

What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use Get-Location or Test-Path; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

Do not continue unless:

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

Common mistake:

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

Exact recovery:

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

What you just accomplished:

You executed and checked one controlled operation rather than treating a long script as a black box.

How this connects to the project:

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 8 lesson index](#)

Action 8.2.C2 — Databricks notebook cell

Application:

Databricks workspace in a web browser

Window or panel:

Databricks notebook cell

Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Run one explained Python instruction and inspect its result before any next command is introduced.

Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

Exact physical actions:

1. CLICK: Bring **Databricks workspace in a web browser** to the front.
2. LOOK FOR: Confirm the current location matches The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action. or the more specific location stated below.

3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

Command or code (Python):

```
print(spark.version)
print({"catalog": catalog, "batch_root": batch_root, "batch_id": batch_id})
```

Where to enter it:

Databricks notebook cell. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

What each part means:

- **Line 1:** `print(spark.version)` — `print` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `(` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `spark.version` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `)` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation
- **Line 2:** `print({"catalog": catalog, "batch_root": batch_root, "batch_id": batch_id})` — `print` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `{` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `"catalog"` is a quoted literal; the quotation marks preserve spaces or mark text; `:` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `catalog` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `,` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `"batch_root"` is a quoted literal; the quotation marks preserve spaces or mark text; `:` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `batch_root` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `,` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `"batch_id"` is a quoted literal; the quotation marks preserve spaces or mark text; `:` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; remaining punctuation and identifiers continue the same statement.

Does it change anything?

This is intended to inspect or validate state rather than change it.

Is it safe to rerun?

Normally safe to rerun because it is observational, but still confirm the execution location first.

What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use Get-Location or Test-Path; for Git, use

`git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

Do not continue unless:

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

Common mistake:

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

Exact recovery:

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

What you just accomplished:

You executed and checked one controlled operation rather than treating a long script as a black box.

How this connects to the project:

This verified state becomes a dependable input to the next Northstar Retail construction action.

Action 8.2.C3 — Databricks SQL editor or %sql notebook cell

Application:

Databricks workspace in a web browser

Window or panel:

Databricks SQL editor or %sql notebook cell

Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Run one explained Sql instruction and inspect its result before any next command is introduced.

Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

Exact physical actions:

1. CLICK: Bring **Databricks workspace in a web browser** to the front.
2. LOOK FOR: Confirm the current location matches The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

Command or code (Sql):

```
SHOW SCHEMAS IN northstar_retail;
```

Where to enter it:

Databricks SQL editor or %sql notebook cell. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

What each part means:

- **Line 1:** `SHOW SCHEMAS IN northstar_retail;` — `SHOW` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `SCHEMAS` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `IN` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `northstar_retail` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation

Does it change anything?

This is intended to inspect or validate state rather than change it.

Is it safe to rerun?

Normally safe to rerun because it is observational, but still confirm the execution location first.

What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

How this connects to the project:

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 8 lesson index](#)

Action 8.2.C5 — Databricks SQL editor

Application:

Databricks workspace in a web browser

Window or panel:

Databricks SQL editor

Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Run one explained Sql instruction and inspect its result before any next command is introduced.

Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

Exact physical actions:

1. CLICK: Bring **Databricks workspace in a web browser** to the front.
2. LOOK FOR: Confirm the current location matches The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

Command or code (Sql):

```
SELECT * FROM northstar_retail.quality.environment_check ORDER BY checked_at_utc DESC LIMIT 10;
```

Where to enter it:

Databricks SQL editor. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

What each part means:

- **Line 1:** `SELECT * FROM northstar_retail.quality.environment_check ORDER BY checked_at_utc DESC LIMIT 10; —` `SELECT` requests data without changing it unless combined with a modifying statement; `*` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `FROM` identifies the source table or query; `northstar_retail.quality.environment_check` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `ORDER` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `BY` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `checked_at_utc` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `DESC` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `LIMIT` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `10` is a numeric literal used by the command or expression

Does it change anything?

This is intended to inspect or validate state rather than change it.

Is it safe to rerun?

Normally safe to rerun because it is observational, but still confirm the execution location first.

What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

How this connects to the project:

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 8 lesson index](#)

What your screen should look like now

Each action you actually performed has a visible result and a recorded ownership status. You have not marked unrun reference commands as complete. The branch, connection, batch, and application context remain known.

Lesson 8.2 completion checklist

☐

I performed actions in order — [STATUS]

☐

I verified each command location — [STATUS]

☐

I distinguished typed text from observed output — [STATUS]

☐

I recorded differences caused by versions/tier — [STATUS]

☐

I stopped at the first unexplained error — [STATUS]

Safe stopping point

Save open work and record the next action number. Close an application only after its operation is complete. On return, re-open the Phase 8 starting-screen checklist and re-verify the active context.

Lesson 8.3 — Create and understand the phase files

What your screen should look like before starting

VS Code Explorer shows the repository root, the intended feature branch is active, and no Phase 8 file is assumed to exist merely because a reference answer appears below. Create each folder only when its first file is needed.

Folder introduction — databricks/

Exact folder name: databricks

Exact parent: repository root

Why it is needed now: Phase 8 is about to place its first responsibility-specific file here; creating it earlier would have produced an unexplained empty structure.

What will eventually be inside: Only files whose purpose matches this folder's name.

Why another folder is not appropriate: Separation keeps source SQL, transformations, tests, configuration, documentation, and generated artifacts reviewable.

Naming rules: Preserve lowercase/uppercase exactly as shown. Hyphens, underscores, spaces, and plural forms create different paths. This project avoids spaces in technical folder names.

VS Code method

1. CLICK: Open Explorer in VS Code.
2. LOOK FOR: Confirm the repository root is the top folder.
3. Expand the parent path repository root one level at a time.
4. RIGHT-CLICK: Right-click the immediate parent folder.
5. CLICK: **New Folder**.
6. TYPE THIS: databricks.
7. PRESS: Enter.
8. LOOK FOR: The folder appears once, at the correct indentation level.

PowerShell method

Action 8.D1.1 — Create the folder databricks

Application:

Databricks workspace in a web browser

Window or panel:

VS Code integrated PowerShell terminal at the repository root

Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

Exact physical actions:

1. CLICK: Bring **Databricks workspace in a web browser** to the front.
2. LOOK FOR: Confirm the current location matches The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

Command or code (PowerShell):

```
New-Item -ItemType Directory -Path ".\databricks" -ErrorAction Stop
```

Where to enter it:

VS Code integrated PowerShell terminal at the repository root. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

What each part means:

- **Line 1:** `New-Item -ItemType Directory -Path ".\databricks" -ErrorAction Stop` — `New-Item` creates a file or folder; `-ItemType` is a command option or flag; its exact behavior is defined beside the command; `Directory` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `-Path` is a command option or flag; its exact behavior is defined beside the command; `".\databricks"` is a path, relative location, branch-style name, or file argument; verify every character before running it; `-ErrorAction` is a command option or flag; its exact behavior is defined beside the command; `Stop` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation

Does it change anything?

This can change files, Git state, packages, database objects, or data.

Is it safe to rerun?

Safe to rerun only after reading the idempotency note and confirming that the same batch, file, or object will not be duplicated.

What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

Do not continue unless:

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

Common mistake:

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

Exact recovery:

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

What you just accomplished:

You executed and checked one controlled operation rather than treating a long script as a black box.

How this connects to the project:

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 8 lesson index](#)

Folder-creation decision branches**If the folder is created**

Run `Test-Path -LiteralPath ".\databricks" -PathType Container` and require `True`.

If PowerShell says the folder already exists

Do not delete or recreate it. Run `Get-ChildItem -LiteralPath ".\databricks" -Force`, inspect its existing files, and preserve them. Continue only when the existing folder is the intended path.

If the parent path does not exist

Return to the parent-folder tutorial. Create and verify one parent level at a time; do not create the entire future tree in one command.

Verify the folder

1. Run `Test-Path ".\databricks" -PathType Container`.
2. Require the output `True` before creating a child file.
3. Remember: Git does not track an empty folder by itself; the folder becomes visible in Git history when a tracked file is added.

Folder introduction — databricks/notebooks/

Exact folder name: notebooks

Exact parent: databricks

Why it is needed now: Phase 8 is about to place its first responsibility-specific file here; creating it earlier would have produced an unexplained empty structure.

What will eventually be inside: Only files whose purpose matches this folder's name.

Why another folder is not appropriate: Separation keeps source SQL, transformations, tests, configuration, documentation, and generated artifacts reviewable.

Naming rules: Preserve lowercase/uppercase exactly as shown. Hyphens, underscores, spaces, and plural forms create different paths. This project avoids spaces in technical folder names.

VS Code method

1. CLICK: Open Explorer in VS Code.
2. LOOK FOR: Confirm the repository root is the top folder.
3. Expand the parent path `databricks` one level at a time.

4. RIGHT-CLICK: Right-click the immediate parent folder.
5. CLICK: **New Folder**.
6. TYPE THIS: notebooks.
7. PRESS: Enter.
8. LOOK FOR: The folder appears once, at the correct indentation level.

PowerShell method

Action 8.D2.1 — Create the folder databricks/notebooks

Application:

Databricks workspace in a web browser

Window or panel:

VS Code integrated PowerShell terminal at the repository root

Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

Exact physical actions:

1. CLICK: Bring **Databricks workspace in a web browser** to the front.
2. LOOK FOR: Confirm the current location matches The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

Command or code (PowerShell):

```
New-Item -ItemType Directory -Path ".\databricks\notebooks" -ErrorAction Stop
```

Where to enter it:

VS Code integrated PowerShell terminal at the repository root. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

What each part means:

- **Line 1:** `New-Item -ItemType Directory -Path ".\databricks\notebooks" -ErrorAction Stop` — `New-Item` creates a file or folder; `-ItemType` is a command option or flag; its exact behavior is defined beside the command; `Directory` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `-Path` is a command option or flag; its exact behavior is defined beside the command; `.\databricks\notebooks` is a path, relative location, branch-style name, or file argument; verify every character before running it; `-ErrorAction` is a command option or flag; its exact behavior is defined beside the command; `Stop` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation

Does it change anything?

This can change files, Git state, packages, database objects, or data.

Is it safe to rerun?

Safe to rerun only after reading the idempotency note and confirming that the same batch, file, or object will not be duplicated.

What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

Do not continue unless:

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

Common mistake:

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

Exact recovery:

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

What you just accomplished:

You executed and checked one controlled operation rather than treating a long script as a black box.

How this connects to the project:

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 8 lesson index](#)

Folder-creation decision branches

If the folder is created

Run `Test-Path -LiteralPath ".\databricks\notebooks" -PathType Container` and require `True`.

If PowerShell says the folder already exists

Do not delete or recreate it. Run `Get-ChildItem -LiteralPath ".\databricks\notebooks" -Force`, inspect its existing files, and preserve them. Continue only when the existing folder is the intended path.

If the parent path does not exist

Return to the parent-folder tutorial. Create and verify one parent level at a time; do not create the entire future tree in one command.

Verify the folder

1. Run `Test-Path ".\databricks\notebooks" -PathType Container`.
2. Require the output `True` before creating a child file.
3. Remember: Git does not track an empty folder by itself; the folder becomes visible in Git history when a tracked file is added.

File introduction — databricks/README.md

Exact filename: `README.md`

Filename extension: `.md`. In this project it identifies project documentation and helps the correct application choose syntax

highlighting or execution behavior.

Exact parent folder: databricks relative to the repository root.

Why this file belongs there: Files with the same responsibility are grouped so a reviewer can find configuration, source SQL, transformations, tests, documentation, and report assets without guessing.

What the file will contain: project documentation for Phase 8.

Later dependencies: Later phase commands, tests, GitHub Actions, Databricks tasks, warehouse loads, Power BI work, or portfolio evidence may depend on its exact path.

Should Git track it? Yes, unless the lesson explicitly identifies it as generated data, a local secret, a log, or a machine-specific artifact.

Could it contain secrets? It should not contain live passwords, tokens, connection strings, or account identifiers.

What happens if it is missing: The corresponding phase cannot be reproduced, validated, or explained from the repository alone.

VS Code click path

1. CLICK: In VS Code, open **Explorer** from the left Activity Bar.
2. LOOK FOR: Confirm the top-level folder name is SQL-Data-Warehouse-Project and the status bar shows the intended Git branch.
3. CLICK: Expand each parent folder in databricks one level at a time.
4. If a parent folder does not exist, use the folder tutorial in this phase before creating the file.
5. RIGHT-CLICK: Right-click the immediate parent folder.
6. CLICK: Select **New File**.
7. TYPE THIS: README.md.
8. PRESS: Enter.
9. LOOK FOR: A new editor tab labeled README.md and an empty file under the correct parent folder.
10. PRESS: Ctrl+S after adding each explained section.

PowerShell path

Action 8.F1.1 — Create the file databricks/README.md from PowerShell

Application:

Databricks workspace in a web browser

Window or panel:

VS Code integrated PowerShell terminal opened at the repository root

Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

Exact physical actions:

1. CLICK: Bring **Databricks workspace in a web browser** to the front.
2. LOOK FOR: Confirm the current location matches The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

Command or code (PowerShell):

```
New-Item -ItemType File -Path ".\databricks\README.md" -ErrorAction Stop
```

Where to enter it:

VS Code integrated PowerShell terminal opened at the repository root. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

Plain-English translation:

What you just accomplished:

You executed and checked one controlled operation rather than treating a long script as a black box.

How this connects to the project:

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 8 lesson index](#)

File-creation decision branches

If the command creates the file

Run `Test-Path -LiteralPath ".\databricks\README.md" -PathType Leaf`. Continue only when it returns True and the file is empty because you just created it.

If PowerShell says the file already exists

Do not add `-Force`, do not clear the file, and do not overwrite it. Open the existing file in VS Code, run `git status --short -- "databricks/README.md"`, inspect its contents and Git history, and decide whether this lesson should edit the preserved file rather than create a new one.

If PowerShell says part of the path does not exist

Stop. Create only the missing parent folder through the earlier folder tutorial, verify it with `Test-Path -PathType Container`, and rerun this one file command.

File-content construction

1. Start with the smallest header, comment, or first section shown in the phase lesson.
2. Read the purpose before typing the section.
3. Add one logical section at a time.
4. Save with `Ctrl+S`.
5. Run the syntax or content validation named in the phase.
6. Correct the first error before adding another section.
7. Use `TODO(USER)` where the workbook requires your own decision or verified value.

File verification

1. In the VS Code Explorer, confirm the file appears under databricks.
2. Right-click the editor tab and choose **Copy Path**; compare the ending with `databricks/README.md`.
3. In PowerShell at the repository root, run `Test-Path ".\databricks\README.md"` and require True.
4. Run `git status --short -- "databricks/README.md"` to see only this file's Git state.
5. Run the phase-specific validator before committing.

Optional reference answer for databricks/README.md

Attempt the file construction first. This reference is learning material, not evidence that you created or ran the file.

Language: Markdown

Exact file: `databricks/README.md`

Purpose: project documentation.

Inputs: The requirements, configuration, source data, or upstream objects described in Phase 8.

Expected outputs: The file's declared objects, logs, tables, checks, or documentation when the user later runs or reads it.

```
# Databricks learning assets

- `notebooks/00...12`: Git-friendly Databricks source notebooks in execution order.
- `jobs/job_definition.example.yml`: version-controlled dependency map.
- `jobs/job_task_map.md`: human-readable dependency diagram.

## Track A boundary

Your local SQL Server and PostgreSQL instances are not reachable from a cloud workspace simply because they use the name `localhost`. Track A therefore extracts locally, uploads a batch folder to a Unity Catalog volume, processes it in Databricks, and exports Gold files for local download. This manual boundary is intentional, honest, and inexpensive for learning.

## Workspace-specific placeholders

Replace catalog, schema, volume, user email, and batch ID values with resources that your workspace permits. Do not commit tokens or passwords. Read Phase 8 and Phase 14 before creating a Job.
```

Line-by-line explanation

- **Line 1:** `# Databricks learning assets` is a comment for a human reader; it normally does not change data or execute business logic.
- **Line 2:** blank line used only to separate logical sections for readability.
- **Line 3:** `- `notebooks/00...12`: Git-friendly Databricks source notebooks in execution order.`—is a command option or flag; its exact behavior is defined beside the command; `notebooks` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `/` is a path, relative location, branch-style name, or file argument; verify every character before running it; `00` is a nu-

meric literal used by the command or expression;...is a path, relative location, branch-style name, or file argument; verify every character before running it;12is a numeric literal used by the command or expression;:is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation;Git-friendlyis a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation;Databricksis a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation;sourceis a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation;notebooksis a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation;in` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; remaining punctuation and identifiers continue the same statement.

[Back to the Phase 8 lesson index](#)

File introduction — `databricks/notebooks/00_environment_check.py`

Exact filename: `00_environment_check.py`

Filename extension: `.py`. In this project it identifies executable Python logic and helps the correct application choose syntax highlighting or execution behavior.

Exact parent folder: `databricks/notebooks` relative to the repository root.

Why this file belongs there: Files with the same responsibility are grouped so a reviewer can find configuration, source SQL, transformations, tests, documentation, and report assets without guessing.

What the file will contain: executable Python logic for Phase 8.

Later dependencies: Later phase commands, tests, GitHub Actions, Databricks tasks, warehouse loads, Power BI work, or portfolio evidence may depend on its exact path.

Should Git track it? Yes, unless the lesson explicitly identifies it as generated data, a local secret, a log, or a machine-specific artifact.

Could it contain secrets? Yes—review carefully before Git staging.

What happens if it is missing: The corresponding phase cannot be reproduced, validated, or explained from the repository alone.

VS Code click path

1. CLICK: In VS Code, open **Explorer** from the left Activity Bar.
2. LOOK FOR: Confirm the top-level folder name is `SQL-Data-Warehouse-Project` and the status bar shows the intended Git branch.
3. CLICK: Expand each parent folder in `databricks/notebooks` one level at a time.
4. If a parent folder does not exist, use the folder tutorial in this phase before creating the file.
5. RIGHT-CLICK: Right-click the immediate parent folder.
6. CLICK: Select **New File**.
7. TYPE THIS: `00_environment_check.py`.
8. PRESS: Enter.
9. LOOK FOR: A new editor tab labeled `00_environment_check.py` and an empty file under the correct parent folder.
10. PRESS: Ctrl+S after adding each explained section.

PowerShell path

Action 8.F2.1 — Create the file `databricks/notebooks/00_environment_check.py` from PowerShell

Application:

Databricks workspace in a web browser

Window or panel:

VS Code integrated PowerShell terminal opened at the repository root

Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

Exact physical actions:

1. CLICK: Bring **Databricks workspace in a web browser** to the front.
2. LOOK FOR: Confirm the current location matches The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

Command or code (PowerShell):

```
New-Item -ItemType File -Path ".\databricks\notebooks\00_environment_check.py" -ErrorAction Stop
```

Where to enter it:

VS Code integrated PowerShell terminal opened at the repository root. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

What each part means:

- **Line 1:** `New-Item -ItemType File -Path ".\databricks\notebooks\00_environment_check.py" -ErrorAction Stop`
— `New-Item` creates a file or folder; `-ItemType` is a command option or flag; its exact behavior is defined beside the command; `File` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `-Path` is a command option or flag; its exact behavior is defined beside the command; `".\databricks\notebooks\00_environment_check.py"` is a path, relative location, branch-style name, or file argument; verify every character before running it; `-ErrorAction` is a command option or flag; its exact behavior is defined beside the command; `Stop` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation

Does it change anything?

This can change files, Git state, packages, database objects, or data.

Is it safe to rerun?

Safe to rerun only after reading the idempotency note and confirming that the same batch, file, or object will not be duplicated.

What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

Do not continue unless:

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

Common mistake:

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

Exact recovery:

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

What you just accomplished:

You executed and checked one controlled operation rather than treating a long script as a black box.

How this connects to the project:

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 8 lesson index](#)

File-creation decision branches**If the command creates the file**

Run `Test-Path -LiteralPath ".\databricks\notebooks\00_environment_check.py" -PathType Leaf`. Continue only when it returns `True` and the file is empty because you just created it.

If PowerShell says the file already exists

Do not add `-Force`, do not clear the file, and do not overwrite it. Open the existing file in VS Code, run `git status --short -- "databricks/notebooks/00_environment_check.py"`, inspect its contents and Git history, and decide whether this lesson should edit the preserved file rather than create a new one.

If PowerShell says part of the path does not exist

Stop. Create only the missing parent folder through the earlier folder tutorial, verify it with `Test-Path -PathType Container`, and rerun this one file command.

File-content construction

1. Start with the smallest header, comment, or first section shown in the phase lesson.
2. Read the purpose before typing the section.
3. Add one logical section at a time.
4. Save with `Ctrl+S`.
5. Run the syntax or content validation named in the phase.
6. Correct the first error before adding another section.
7. Use `TODD(USER)` where the workbook requires your own decision or verified value.

File verification

1. In the VS Code Explorer, confirm the file appears under `databricks/notebooks`.
2. Right-click the editor tab and choose **Copy Path**; compare the ending with `databricks/notebooks/00_environment_check.py`.
3. In PowerShell at the repository root, run `Test-Path ".\databricks\notebooks\00_environment_check.py"` and require `True`.

4. Run `git status --short -- "databricks/notebooks/00_environment_check.py"` to see only this file's Git state.
5. Run the phase-specific validator before committing.

Optional reference answer for databricks/notebooks/00_environment_check.py

Attempt the file construction first. This reference is learning material, not evidence that you created or ran the file.

Language: Python

Exact file: databricks/notebooks/00_environment_check.py

Purpose: executable Python logic.

Inputs: The requirements, configuration, source data, or upstream objects described in Phase 8.

Expected outputs: The file's declared objects, logs, tables, checks, or documentation when the user later runs or reads it.

```
# Databricks notebook source
# Northstar Retail End-to-End Data Platform
# This file is a Git-friendly Databricks source notebook.
# Track A reads files that you manually uploaded to a Unity Catalog volume.
# It never attempts to reach SQL Server or PostgreSQL on localhost.

# COMMAND -----
# MAGIC %md
# MAGIC # 00 – Environment check
# MAGIC **Purpose:** verify Spark, parameters, catalog, schemas, volume access, and Delta read/write.
# MAGIC **Input:** widget values. **Output:** one disposable Delta test table and a task value.

# COMMAND -----
from datetime import datetime, timezone
from pyspark.sql import functions as F

for name, default in {
    "catalog": "northstar_retail",
    "landing_schema": "landing",
    "bronze_schema": "bronze",

[Back to the Phase 8 lesson index](#)

What your screen should look like now

- Every Phase 8 file you actually created appears under the correct parent folder.
- Your open editor tab matches the file you are validating.
- The Git branch has not changed unexpectedly.
- `git status --short` lists only expected work.
- Reference answers remain reference material; your status fields are not automatically completed.

Lesson 8.3 completion checklist

☐

`databricks/README.md` was created by me, saved, located correctly, and inspected — [STATUS]

☐

`databricks/notebooks/00_environment_check.py` was created by me, saved, located correctly, and inspected — [STATUS]

Safe stopping point

Save every open file with `Ctrl+S`. You may close VS Code only after `git status --short` is recorded in your journal. The terminal may be closed when no installer, transaction, Python process, Databricks run, warehouse load, or Power BI refresh is active. Resume at [Lesson 8.4](#) and recheck the root and branch.

Lesson 8.4 — Build and validate required objects

What your screen should look like before starting

The phase files are saved, the correct application and connection are visible, and the upstream input has passed its verification gate. Build one object at a time; do not create many objects and inspect them only at the end.

Action 8.4.G1 — Inspect the current state without changing it

Application:

Web browser

Window or panel:

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

Starting condition:

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Inspect the current state without changing it. This is one bounded construction or inspection task.

Why this action comes now:

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

Exact physical actions:

1. Record the exact starting folders, branch, versions, connections, settings, counts, or evidence.
2. Inspect the result.
3. Record the actual value.
4. Continue only after verification.

Command or code:

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

Where to enter it:

Web browser. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

What each part means:

1. Record the exact starting folders, branch, versions, connections, settings, counts, or evidence.
2. Inspect the result.
3. Record the actual value.
4. Continue only after verification.

What should happen:

A visible file, folder, branch, connection, table, notebook, task, relationship, measure, visual, or verification result should appear exactly where the action predicts.

Expected example:

Your exact values may differ. The expected result is the same *type* of object and the same required status, not necessarily the same timestamps, row counts, colors, generated IDs, or screen dimensions.

What may look different:

Menu wording can vary by product release or account tier. Use the official-source register and look for the described object rather than guessing from an old screenshot.

How to verify success:

Reopen or refresh the relevant panel, locate the named object, and inspect the property or output that proves it exists and is in the intended location.

Do not continue unless:

You can point to the visible result and explain what it proves. Mark the action VERIFIED BY USER only after that check.

Common mistake:

Combining several clicks or decisions, choosing a similarly named object, or continuing because no error dialog appeared.

Exact recovery:

Stop at the current screen. Save a screenshot of the error if useful, hide sensitive values, and compare the selected location with the starting condition. Use Back or Cancel rather than Delete or Overwrite. Correct one mismatch and repeat only this action.

What you just accomplished:

You completed one observable piece of the Northstar Retail platform and established a checkpoint that can be audited later.

How this connects to the project:

The resulting object, decision, or evidence becomes an input to the next stage in the source-to-consumption chain.

[Back to the Phase 8 lesson index](#)

Action 8.4.G2 — Create the smallest required object or decision

Application:

Visual Studio Code

Window or panel:

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

Starting condition:

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Create the smallest required object or decision. This is one bounded construction or inspection task.

Why this action comes now:

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

Exact physical actions:

1. Use the phase file tutorial and one bounded action card.
2. Inspect the result.
3. Record the actual value.
4. Continue only after verification.

Command or code:

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

Where to enter it:

Visual Studio Code. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

What each part means:

1. Use the phase file tutorial and one bounded action card.
2. Inspect the result.
3. Record the actual value.
4. Continue only after verification.

What should happen:

A visible file, folder, branch, connection, table, notebook, task, relationship, measure, visual, or verification result should appear exactly where the action predicts.

Expected example:

Your exact values may differ. The expected result is the same *type* of object and the same required status, not necessarily the same timestamps, row counts, colors, generated IDs, or screen dimensions.

What may look different:

Menu wording can vary by product release or account tier. Use the official-source register and look for the described object rather than guessing from an old screenshot.

How to verify success:

Reopen or refresh the relevant panel, locate the named object, and inspect the property or output that proves it exists and is in the intended location.

Do not continue unless:

You can point to the visible result and explain what it proves. Mark the action VERIFIED BY USER only after that check.

Common mistake:

Combining several clicks or decisions, choosing a similarly named object, or continuing because no error dialog appeared.

Exact recovery:

Stop at the current screen. Save a screenshot of the error if useful, hide sensitive values, and compare the selected location

with the starting condition. Use Back or Cancel rather than Delete or Overwrite. Correct one mismatch and repeat only this action.

What you just accomplished:

You completed one observable piece of the Northstar Retail platform and established a checkpoint that can be audited later.

How this connects to the project:

The resulting object, decision, or evidence becomes an input to the next stage in the source-to-consumption chain.

[Back to the Phase 8 lesson index](#)

Action 8.4.G3 — Run the phase-specific verification

Application:

Web browser

Window or panel:

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

Starting condition:

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Run the phase-specific verification. This is one bounded construction or inspection task.

Why this action comes now:

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

Exact physical actions:

1. Compare actual output with the required condition and record differences.
2. Inspect the result.
3. Record the actual value.
4. Continue only after verification.

Command or code:

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

Where to enter it:

Web browser. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

What each part means:

1. Compare actual output with the required condition and record differences.
2. Inspect the result.
3. Record the actual value.
4. Continue only after verification.

What should happen:

A visible file, folder, branch, connection, table, notebook, task, relationship, measure, visual, or verification result should appear exactly where the action predicts.

Expected example:

Your exact values may differ. The expected result is the same *type* of object and the same required status, not necessarily the same timestamps, row counts, colors, generated IDs, or screen dimensions.

What may look different:

Menu wording can vary by product release or account tier. Use the official-source register and look for the described object rather than guessing from an old screenshot.

How to verify success:

Reopen or refresh the relevant panel, locate the named object, and inspect the property or output that proves it exists and is in the intended location.

Do not continue unless:

You can point to the visible result and explain what it proves. Mark the action VERIFIED BY USER only after that check.

Common mistake:

Combining several clicks or decisions, choosing a similarly named object, or continuing because no error dialog appeared.

Exact recovery:

Stop at the current screen. Save a screenshot of the error if useful, hide sensitive values, and compare the selected location with the starting condition. Use Back or Cancel rather than Delete or Overwrite. Correct one mismatch and repeat only this action.

What you just accomplished:

You completed one observable piece of the Northstar Retail platform and established a checkpoint that can be audited later.

How this connects to the project:

The resulting object, decision, or evidence becomes an input to the next stage in the source-to-consumption chain.

[Back to the Phase 8 lesson index](#)

Action 8.4.G4 — Demonstrate one safe failure or alternate-result branch

Application:

Web browser

Window or panel:

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

Starting condition:

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Demonstrate one safe failure or alternate-result branch. This is one bounded construction or inspection task.

Why this action comes now:

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

Exact physical actions:

1. Use a toy/disposable case and prove recovery without damaging verified work.
2. Inspect the result.
3. Record the actual value.
4. Continue only after verification.

Command or code:

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

Where to enter it:

Web browser. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

What each part means:

1. Use a toy/disposable case and prove recovery without damaging verified work.
2. Inspect the result.
3. Record the actual value.
4. Continue only after verification.

What should happen:

A visible file, folder, branch, connection, table, notebook, task, relationship, measure, visual, or verification result should appear exactly where the action predicts.

Expected example:

Your exact values may differ. The expected result is the same *type* of object and the same required status, not necessarily the same timestamps, row counts, colors, generated IDs, or screen dimensions.

What may look different:

Menu wording can vary by product release or account tier. Use the official-source register and look for the described object rather than guessing from an old screenshot.

How to verify success:

Reopen or refresh the relevant panel, locate the named object, and inspect the property or output that proves it exists and is in the intended location.

Do not continue unless:

You can point to the visible result and explain what it proves. Mark the action VERIFIED BY USER only after that check.

Common mistake:

Combining several clicks or decisions, choosing a similarly named object, or continuing because no error dialog appeared.

Exact recovery:

Stop at the current screen. Save a screenshot of the error if useful, hide sensitive values, and compare the selected location with the starting condition. Use Back or Cancel rather than Delete or Overwrite. Correct one mismatch and repeat only this action.

What you just accomplished:

You completed one observable piece of the Northstar Retail platform and established a checkpoint that can be audited later.

How this connects to the project:

The resulting object, decision, or evidence becomes an input to the next stage in the source-to-consumption chain.

[Back to the Phase 8 lesson index](#)

Action 8.4.G5 — Record evidence and prepare the downstream handoff

Application:

Web browser

Window or panel:

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

Starting condition:

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Record evidence and prepare the downstream handoff. This is one bounded construction or inspection task.

Why this action comes now:

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

Exact physical actions:

1. Save the verified input that the next phase consumes.
2. Inspect the result.
3. Record the actual value.
4. Continue only after verification.

Command or code:

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

Where to enter it:

Web browser. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

What each part means:

1. Save the verified input that the next phase consumes.
2. Inspect the result.
3. Record the actual value.
4. Continue only after verification.

What should happen:

A visible file, folder, branch, connection, table, notebook, task, relationship, measure, visual, or verification result should appear exactly where the action predicts.

Expected example:

Your exact values may differ. The expected result is the same *type* of object and the same required status, not necessarily the same timestamps, row counts, colors, generated IDs, or screen dimensions.

What may look different:

Menu wording can vary by product release or account tier. Use the official-source register and look for the described object rather than guessing from an old screenshot.

How to verify success:

Reopen or refresh the relevant panel, locate the named object, and inspect the property or output that proves it exists and is in the intended location.

Do not continue unless:

You can point to the visible result and explain what it proves. Mark the action VERIFIED BY USER only after that check.

Common mistake:

Combining several clicks or decisions, choosing a similarly named object, or continuing because no error dialog appeared.

Exact recovery:

Stop at the current screen. Save a screenshot of the error if useful, hide sensitive values, and compare the selected location with the starting condition. Use Back or Cancel rather than Delete or Overwrite. Correct one mismatch and repeat only this action.

What you just accomplished:

You completed one observable piece of the Northstar Retail platform and established a checkpoint that can be audited later.

How this connects to the project:

The resulting object, decision, or evidence becomes an input to the next stage in the source-to-consumption chain.

[Back to the Phase 8 lesson index](#)

What your screen should look like now

- The new Phase 8 objects are visible in their owning application.
- The current branch remains the intended feature branch.
- The current database, catalog, schema, Power BI model, or GitHub run is still identifiable.
- Verification output is visible or recorded; no object is marked complete solely because creation code was displayed.
- Any failed toy demonstration has been repaired or isolated.

Lesson 8.4 completion checklist

☐

Every required object was built separately — [STATUS]

☐

Every object has a declared responsibility/grain — [STATUS]

☐

Inputs and outputs were inspected — [STATUS]

☐

A rerun or alternate-result branch was tested where applicable — [STATUS]

☐

Counts, keys, measures, relationships, or settings were independently validated — [STATUS]

☐

I can explain one failure and its safest recovery — [STATUS]

Safe stopping point

Stop only after the active command, database transaction, Databricks cell/Job, Python process, warehouse load, or Power BI refresh finishes. Save all files and the Power BI project. Record uncommitted Git changes and exact resume action. Resume at [Lesson 8.5](#).

Lesson 8.5 — Verify, troubleshoot, commit, teach back, and stop safely

What your screen should look like before starting

The Phase 8 outputs are visible, all runs are finished, open files are saved, and you can state the active branch and execution context. Any error you encountered has a recorded message and has not been hidden by deleting evidence.

Design decision — Databricks compute and storage

Question:

Which UI and compute path should the learner use when tiers differ?

Options considered:

- Serverless when available.
- Classic compute when allowed.
- Skip execution.

Beginner path selected:

Use the compute option the workspace actually offers and a governed volume or My Files fallback.

Why this path was selected:

It is tier-aware and avoids claiming unavailable features.

Tradeoff:

Free or trial quotas and labels vary.

What a company might do instead:

Enterprises define Unity Catalog objects, external locations, policies, service principals, and job clusters.

How to explain this in an interview:

I verified the workspace tier first and selected an available compute/storage path while keeping object names and validation contracts consistent.

Design decision — Databricks storage options

Question:

Where should Track A batch files be placed when workspace features and permissions vary?

Options considered:

- A governed Unity Catalog volume.
- Workspace or user file storage available to the account.
- An external cloud storage location.

Beginner path selected:

Use a governed volume when permitted; otherwise use the workspace-supported user-file fallback and record the exact path, limitation, and cleanup procedure.

Why this path was selected:

The path remains observable and tier-aware without inventing permissions. A governed volume teaches catalog/schema ownership while the fallback keeps the learning path usable.

Tradeoff:

Fallback storage can have tighter quotas, weaker sharing, or different governance and should not be presented as the enterprise target.

What a company might do instead:

Use external locations and cloud object storage with storage credentials, managed identities, access controls, lifecycle policies, and infrastructure as code.

How to explain this in an interview:

I selected the most governed storage object my workspace actually allowed and parameterized the path so the pipeline contract survived tier differences.

If you see Result A

A writable catalog/schema/storage path and available compute run the environment check. Record the exact result, perform the named independent verification, and continue only when the gate is satisfied.

If you see Result B

The workspace exposes a different tier/UI, lacks permission, or offers a different compute/storage object. Treat this as information, not permission to delete or overwrite. Follow the branch-specific diagnostic in the current action, preserve evidence, and continue only after the state is understood.

If you see an error

Read the first meaningful error line, redact secrets, and verify the application, path, branch, server/database, catalog/schema, batch ID, parameters, version/tier, and object name. Run the smallest observational check first. Do not reset Git history, drop data, disable a rule, force-push, or replace the target merely to make the error disappear.

Phase-specific verification gate

☐

Required files/objects exist in the exact location.

☐

I personally created or configured them.

☐

I ran the phase commands in the documented context.

☐

I inspected the output rather than relying on a green icon alone.

☐

Counts, keys, relationships, measures, checksums, statuses, or settings meet the declared contract.

☐

Same-batch/rerun behavior is known where applicable.

☐

A controlled failure or realistic alternate-result branch was tested safely where applicable.

☐

No password, token, or secret appears in tracked files, screenshots, notebook output, terminal history pasted into documentation, or staged changes.

☐

Actual verified result: [ENTER VERIFIED RESULT].

Point-of-failure troubleshooting record

Exact or representative error message:

[PASTE THE FIRST MEANINGFUL ERROR, WITH SECRETS REDACTED]

What it means in plain language:

[WRITE YOUR INTERPRETATION]

Most likely cause:

[WRITE ONE TESTABLE HYPOTHESIS]

What not to do:

Do not delete data, drop databases, reset Git history, force-push, disable constraints, edit raw evidence, change a quality threshold, or expose credentials merely to make the symptom disappear.

First diagnostic action:

[ENTER THE SMALLEST OBSERVATIONAL CHECK]

How to read the diagnostic result:

[RESULT A MEANS... / RESULT B MEANS...]

Safest fix:

[ENTER THE NARROW FIX]

Alternative fix when applicable:

[ENTER OR N/A]

How to verify the fix:

[ENTER THE INDEPENDENT RECHECK]

How to return to the main tutorial:

Resume at the exact action number that failed; do not skip its verification gate.

Screenshot checkpoint

Application(s) that should be visible: Web browser, Databricks workspace, VS Code, and File Explorer.

Window/panel: Show workspace/catalog/schema/volume/compute plus successful environment-check output.

Sensitive information to hide: Passwords, tokens, connection strings, email addresses, cloud account IDs, unnecessary Windows profile details, and any secret revealed by an error.

Include: The object name, batch/run ID when relevant, result/status, and enough surrounding UI to prove which application and layer is shown.

Crop out: Unrelated desktop windows, notification previews, bookmarks, chat, and empty background.

Recommended filename: docs/images/phase08_configure-databricks-governed-storage-notebooks-and-com_verified.png.

Recommended repository folder: docs/images/.

README placement: The section describing Phase 8's verified result; do not use the image before the result is actually verified.

What it proves: The visible state existed under the shown context. It does not prove hidden rows, other batches, every filter combination, or a later run.

[ADD YOUR VERIFIED SCREENSHOT HERE]

Git checkpoint after the verified Phase 8 changes

Do not use `git add .` until you understand that it stages every matching change under the current directory, including files you did not intend. Prefer targeted staging after inspecting status and diffs.

Save open work

1. PRESS: In VS Code, press Ctrl+K, then S if you use **Save All**, or press Ctrl+S in every modified editor.
2. In Power BI, press Ctrl+S and confirm the local file location.
3. Wait for database, Python, Databricks, and refresh operations to finish; Git does not capture uncommitted database/cloud state.

Action 8.5.G1 — Verify the repository root before Git operations

Application:

Windows PowerShell or the VS Code PowerShell terminal

Window or panel:

VS Code integrated PowerShell terminal

Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

Exact physical actions:

1. CLICK: Bring **Windows PowerShell or the VS Code PowerShell terminal** to the front.
2. LOOK FOR: Confirm the current location matches The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

Command or code (PowerShell):

```
git rev-parse --show-toplevel
```

Where to enter it:

VS Code integrated PowerShell terminal. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

What each part means:

- **Line 1:** `git rev-parse --show-toplevel` — `git` calls the Git version-control program; `rev-parse` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `--show` is a command option or flag; its exact behavior is defined beside the command; `-toplevel` is a command option or flag; its exact behavior is defined beside the command

Does it change anything?

This is intended to inspect or validate state rather than change it.

Is it safe to rerun?

Normally safe to rerun because it is observational, but still confirm the execution location first.

What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

Do not continue unless:

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

Common mistake:

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

Exact recovery:

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

What you just accomplished:

You executed and checked one controlled operation rather than treating a long script as a black box.

How this connects to the project:

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 8 lesson index](#)

Action 8.5.G2 — Verify the active Git branch

Application:

Windows PowerShell or the VS Code PowerShell terminal

Window or panel:

VS Code integrated PowerShell terminal

Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

Exact physical actions:

1. CLICK: Bring **Windows PowerShell or the VS Code PowerShell terminal** to the front.
2. LOOK FOR: Confirm the current location matches The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

Command or code (PowerShell):

```
git branch --show-current
```

Where to enter it:

VS Code integrated PowerShell terminal. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

What each part means:

- **Line 1:** `git branch --show-current` — `git` calls the Git version-control program; `branch` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `--show` is a

command option or flag; its exact behavior is defined beside the command; -current is a command option or flag; its exact behavior is defined beside the command

Does it change anything?

This is intended to inspect or validate state rather than change it.

Is it safe to rerun?

Normally safe to rerun because it is observational, but still confirm the execution location first.

What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use Get-Location or Test-Path; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

Do not continue unless:

The result is visible, understandable, and recorded as RUN BY USER or VERIFIED BY USER. Displaying this workbook does not count as execution.

Common mistake:

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

Exact recovery:

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

What you just accomplished:

You executed and checked one controlled operation rather than treating a long script as a black box.

How this connects to the project:

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 8 lesson index](#)

Action 8.5.G3 — Inspect all current Git changes

Application:

Windows PowerShell or the VS Code PowerShell terminal

Window or panel:

VS Code integrated PowerShell terminal

Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

Exact physical actions:

1. CLICK: Bring **Windows PowerShell or the VS Code PowerShell terminal** to the front.
2. LOOK FOR: Confirm the current location matches The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

Command or code (PowerShell):

```
git status --short
```

Where to enter it:

VS Code integrated PowerShell terminal. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

What each part means:

- **Line 1:** `git status --short` — `git` calls the Git version-control program; `status` shows tracked, staged, modified, and untracked work; `--short` is a command option or flag; its exact behavior is defined beside the command

Does it change anything?

This is intended to inspect or validate state rather than change it.

Is it safe to rerun?

Normally safe to rerun because it is observational, but still confirm the execution location first.

What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

Do not continue unless:

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

Common mistake:

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

Exact recovery:

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

What you just accomplished:

You executed and checked one controlled operation rather than treating a long script as a black box.

How this connects to the project:

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 8 lesson index](#)

Interpret `git status --short`

- ?? means untracked: Git sees a new path but it is not staged.
- M means modified in the working tree but not staged.
- M means the staged version differs from the last commit.
- MM means a staged version exists and the file has additional unstaged edits.
- A means staged as a new file.
- D means deletion; stop and investigate unless deletion is deliberate.
- R means rename; inspect both old and new paths.
- A blank result means the working tree is clean. It does not prove database, Databricks, or Power BI work occurred.

Action 8.5.G4 — Inspect the unstaged diff for databricks/README.md

Application:

Databricks workspace in a web browser

Window or panel:

VS Code integrated PowerShell terminal

Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

Exact physical actions:

1. CLICK: Bring **Databricks workspace in a web browser** to the front.
2. LOOK FOR: Confirm the current location matches The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

Command or code (PowerShell):

```
git diff -- "databricks/README.md"
```

Where to enter it:

VS Code integrated PowerShell terminal. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

What each part means:

- **Line 1:** `git diff -- "databricks/README.md"` — `git` calls the Git version-control program; `diff` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `--` is a command option or flag; its exact behavior is defined beside the command; `"databricks/README.md"` is a path, relative location, branch-style name, or file argument; verify every character before running it

Does it change anything?

This is intended to inspect or validate state rather than change it.

Is it safe to rerun?

Normally safe to rerun because it is observational, but still confirm the execution location first.

What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

Do not continue unless:

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

Common mistake:

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

Exact recovery:

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

What you just accomplished:

You executed and checked one controlled operation rather than treating a long script as a black box.

How this connects to the project:

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 8 lesson index](#)

Action 8.5.G5 — Stage only the reviewed file databricks/README.md

Application:

Databricks workspace in a web browser

Window or panel:

VS Code integrated PowerShell terminal

Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

Exact physical actions:

1. CLICK: Bring **Databricks workspace in a web browser** to the front.
2. LOOK FOR: Confirm the current location matches The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

Command or code (PowerShell):

```
git add -- "databricks/README.md"
```

Where to enter it:

VS Code integrated PowerShell terminal. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

What each part means:

- **Line 1:** `git add -- "databricks/README.md"` — `git` calls the Git version-control program; `add` moves selected changes into the staging area; `--` is a command option or flag; its exact behavior is defined beside the command; `"databricks/README.md"` is a path, relative location, branch-style name, or file argument; verify every character before running it

Does it change anything?

This can change files, Git state, packages, database objects, or data.

Is it safe to rerun?

Safe to rerun only after reading the idempotency note and confirming that the same batch, file, or object will not be duplicated.

What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

Do not continue unless:

The result is visible, understandable, and recorded as RUN BY USER or VERIFIED BY USER. Displaying this workbook does not count as execution.

Common mistake:

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

Exact recovery:

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

What you just accomplished:

You executed and checked one controlled operation rather than treating a long script as a black box.

How this connects to the project:

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 8 lesson index](#)

For every additional intended path, run a separate targeted `git add -- "path"` after its diff is reviewed. Never stage `.env`, generated raw batches, credentials, tokens, local database files, or an unverified Power BI artifact.

Action 8.5.G6 — Inspect the staged diff

Application:

Windows PowerShell or the VS Code PowerShell terminal

Window or panel:

VS Code integrated PowerShell terminal

Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 8 lesson index](#)

Action 8.5.G7 — Create the Phase 8 commit

Application:

Databricks workspace in a web browser

Window or panel:

VS Code integrated PowerShell terminal

Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

Exact physical actions:

1. CLICK: Bring **Databricks workspace in a web browser** to the front.
2. LOOK FOR: Confirm the current location matches The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

Command or code (PowerShell):

```
git commit -m "feat: configure databricks environment and storage"
```

Where to enter it:

VS Code integrated PowerShell terminal. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

What each part means:

- **Line 1:** `git commit -m "feat: configure databricks environment and storage"` — `git` calls the Git version-control program; `commit` records the staged snapshot; `-m` asks Python to run an installed module; `"feat: configure databricks environment and storage"` is a quoted literal; the quotation marks preserve spaces or mark text

Does it change anything?

This can change files, Git state, packages, database objects, or data.

Is it safe to rerun?

Safe to rerun only after reading the idempotency note and confirming that the same batch, file, or object will not be duplicated.

What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

Do not continue unless:

The result is visible, understandable, and recorded as RUN BY USER or VERIFIED BY USER. Displaying this workbook does not count as execution.

Common mistake:

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

Exact recovery:

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

What you just accomplished:

You executed and checked one controlled operation rather than treating a long script as a black box.

How this connects to the project:

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 8 lesson index](#)

Action 8.5.G8 — Verify the new commit

Application:

Windows PowerShell or the VS Code PowerShell terminal

Window or panel:

VS Code integrated PowerShell terminal

Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

Exact physical actions:

1. CLICK: Bring **Windows PowerShell or the VS Code PowerShell terminal** to the front.
2. LOOK FOR: Confirm the current location matches The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

Command or code (PowerShell):

```
git log -1 --oneline --decorate
```

Where to enter it:

VS Code integrated PowerShell terminal. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

What each part means:

- **Line 1:** `git log -1 --oneline --decorate` — `git` calls the Git version-control program; `log` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `-1` is a command option or flag; its exact behavior is defined beside the command; `--oneline` is a command option or flag; its exact behavior is defined beside the command; `--decorate` is a command option or flag; its exact behavior is defined beside the command

Does it change anything?

This is intended to inspect or validate state rather than change it.

Is it safe to rerun?

Normally safe to rerun because it is observational, but still confirm the execution location first.

What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

Do not continue unless:

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

Common mistake:

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

Exact recovery:

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

What you just accomplished:

You executed and checked one controlled operation rather than treating a long script as a black box.

How this connects to the project:

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 8 lesson index](#)

Action 8.5.G9 — Push the feature branch and set upstream

Application:

Windows PowerShell or the VS Code PowerShell terminal

Window or panel:

VS Code integrated PowerShell terminal

Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

Exact physical actions:

1. CLICK: Bring **Windows PowerShell or the VS Code PowerShell terminal** to the front.
2. LOOK FOR: Confirm the current location matches The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

Command or code (PowerShell):

```
git push -u origin "$(git branch --show-current)"
```

Where to enter it:

VS Code integrated PowerShell terminal. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

What each part means:

- **Line 1:** `git push -u origin "$(git branch --show-current)"` — `git` calls the Git version-control program; `push` sends local commits to a remote repository; `-u` is a command option or flag; its exact behavior is defined beside the command; `origin` the conventional name of the GitHub remote; `"$(git branch --show-current)"` is a quoted literal; the quotation marks preserve spaces or mark text

Does it change anything?

This can change files, Git state, packages, database objects, or data.

Is it safe to rerun?

Safe to rerun only after reading the idempotency note and confirming that the same batch, file, or object will not be duplicated.

What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

Do not continue unless:

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

Common mistake:

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

Exact recovery:

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

What you just accomplished:

You executed and checked one controlled operation rather than treating a long script as a black box.

How this connects to the project:

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 8 lesson index](#)

Verify on GitHub

1. CLICK: Open the repository page in a browser.
2. CLICK: Open the branch selector above the file list.
3. TYPE THIS: The exact branch name returned locally.
4. CLICK: Select that branch.
5. LOOK FOR: The latest commit message `feat: configure databricks environment and storage` and the intended changed paths.
6. CLICK: Open each changed file and confirm the GitHub version matches the staged diff.
7. Do not merge solely because the push succeeded; CI and review must pass.

Push-rejected recovery

If Git says the remote contains work you do not have, do not use `--force`. Run `git fetch origin`, inspect `git log --oneline --graph --decorate --all -20`, then rebase or merge only after understanding the divergence. Resolve conflicts one file at a time, run tests again, and push normally. A rejection protects remote work; it is not permission to overwrite it.

Explain it in your own words

Without copying the model answer, explain:

1. What you created or configured in Phase 8.
2. Why it exists.
3. Where it is located on your computer, in a database, in Databricks, in Power BI, or on GitHub.
4. What information enters it.
5. What information leaves it.
6. How it connects to the next phase.
7. How you verified it.
8. What could cause it to fail.
9. Which decision/tradeoff you could defend in an interview.

My answer

[WRITE YOUR ANSWER BEFORE READING THE REFERENCE]

OPTIONAL REFERENCE ANSWER — PHASE 8 TEACH-BACK MODEL

Read this only after completing **MY TASK** and using the three hints in order. The model is a learning reference, not evidence of your execution.

"Phase 8 created the verified boundary described by **Configure Databricks, governed storage, notebooks, and compute**. It consumes only the outputs accepted from earlier phases, produces a named and auditable handoff, and records enough metadata and tests to detect wrong context, missing data, duplicates, failed rules, or unsafe reruns. I verified the result in its owning application and connected the evidence to Git without claiming that displayed instructions were executed."

Mini quiz

1. Multiple choice: Why does Phase 8 occur at this point in the source-to-consumption chain? A) Because menu order is arbitrary. B) Because its verified upstream input now exists. C) Because later phases do not depend on it. D) To create portfolio screenshots before validation.
 2. True or false: A command that displays no error is automatically verified even when it ran in the wrong folder, database, catalog, schema, branch, or filter context.
 3. Fill in the blank: The statement that defines what one row represents is the table or entity _____.
 4. What command would you use first to confirm the PowerShell current folder before a repository command?
 5. Troubleshooting: Your output differs from the example. What should you check before deleting, overwriting, resetting, force-pushing, or weakening a test?
 6. Design choice: Explain one tradeoff of Track A and one production alternative.
 7. Code reading: Why are input, accepted, rejected, and deduplicated counts recorded separately?
 8. Ownership: Which status may you select only after personally performing and inspecting the verification?
-

Mini quiz answer key and explanations

1. **B.** This phase is ordered after its prerequisites so its output has a trustworthy input. A is wrong because order is intentional; C is wrong because later phases depend on the handoff; D is wrong because screenshots follow verification.
2. **False.** Lack of an error proves only that the application accepted something; context and independent verification still matter.
3. **Grain.** Grain is the precise meaning of one row. A key identifies a row, but it does not by itself state the row's business meaning.
4. **Get-Location.** It shows the shell's current folder. `git rev-parse --show-toplevel` separately verifies the repository root when inside a clone.
5. Check application, folder/path, branch, server/database, catalog/schema, batch ID, parameters, source/target grain, filter context, version/tier differences, and the first meaningful error. Destructive changes are not a diagnostic step.
6. Track A has manual upload/download boundaries and batch latency. A production alternative is routable private connectivity with cloud object storage/managed warehouse, identities, and automated orchestration.
7. Separate counts make every row outcome explainable. A single final count can hide silent drops, duplicates, or records that moved to quarantine.
8. **Verified by me / VERIFIED BY USER.** PLANNED, CREATED BY USER, and RUN BY USER describe earlier states; only inspected evidence supports verification.

What I still need to practice:

[WRITE YOUR ANSWER]

What your screen should look like now

- The phase output and final validation are saved or visible.
- The intended feature branch is still active.
- `git status` is either clean after the commit or lists only deliberately deferred work recorded in the journal.
- The branch exists on GitHub after a successful push.
- No database transaction, Databricks run, loader, test process, or Power BI refresh is still active.
- The next phase's required input is identifiable.

Lesson 8.5 completion checklist

☐

I completed the verification gate with my actual results — [STATUS]

☐

I recorded at least one realistic failure, alternate result, or diagnostic path — [STATUS]

☐

I captured and redacted the required screenshot only after verification — [STATUS]

☐

I reviewed, staged, committed, pushed, and verified only the intended Git changes — [STATUS]

☐

I completed the teach-back, quiz, answer review, and learning journal — [STATUS]

☐

I can name the exact verified handoff to the next phase — [STATUS]

Safe stopping point

All files must be saved. The terminal may be closed after the Git result is recorded. SSMS/pgAdmin may be closed after queries finish and transactions are committed/rolled back. Databricks compute may be stopped when no Job or notebook is running. Power BI may be closed after saving. Resume from the next phase's screen-start checklist and re-verify root, branch, connection, and latest accepted batch.

How this phase connects to the next phase

Phase 9 ingests that exact batch into append-only raw Delta tables.

Phase 8 completion checklist

☐

Phase goal explained in my own words — [STATUS]

☐

Required files/objects created by me — [STATUS]

☐

Commands run by me — [STATUS]

☐

Output independently inspected — [STATUS]

☐

Failure/alternate branch understood — [STATUS]

☐

Screenshot captured and redacted — [STATUS]

☐

Targeted Git commit exists — [STATUS]

☐

Branch pushed and verified on GitHub — [STATUS]

☐

Quiz completed before answer key — [STATUS]

☐

Journal completed — [STATUS]

☐

Final phase status manually set — [] Not started / [-] In progress / [x] Verified by me / [!] Needs troubleshooting

[Back to the master table of contents](#)

Phase 9 — Build the Bronze ingestion layer

[Back to the master table of contents](#)

Track: Track A required

Status when first opened: PLANNED

Completion rule: The phase is not complete because its instructions exist. Mark it VERIFIED BY USER only after you perform the work, inspect the output, and save evidence.

Why this phase happens now

Earlier work this phase depends on: Bronze tables that preserve values and ingestion metadata.

What would go wrong if it happened earlier: You would create objects without a verified requirement, valid upstream input, protected repository state, or known execution environment.

Later work that depends on it: Phase 10 cleans, types, deduplicates, and quarantines Bronze records.

Decision being made: Choose and verify the simplest local-first method that teaches the professional concept without pretending that local services are publicly reachable.

Alternatives: A company could use managed cloud databases, infrastructure as code, service principals, direct JDBC publication, deployment bundles, or streaming. Those options are discussed as tradeoffs, not substituted silently.

Beginner path selected: Track A: local SQL Server and PostgreSQL, Python batch extracts, manual governed upload to Databricks, Delta Bronze/Silver/Gold, manual verified export, local SQL Server warehouse, and Power BI Import.

Reason for the order: Requirements become source decisions; sources become generated data; source data becomes extraction batches; batches become Bronze; Bronze becomes Silver; Silver becomes Gold; Gold becomes warehouse and Power BI input.

Phase 9 lesson index

1. [Lesson 9.1 — Understand the phase and starting screen](#)
2. [Lesson 9.2 — Perform the notebook-guided actions one at a time](#)
3. [Lesson 9.3 — Create and understand the phase files](#)
4. [Lesson 9.4 — Build and validate required objects](#)
5. [Lesson 9.5 — Verify, troubleshoot, commit, teach back, and stop safely](#)

Lesson 9.1 — Understand the phase and starting screen

What your screen should look like before starting

- **Application open:** Databricks workspace, Catalog Explorer, notebooks, and Jobs-compatible compute.
- **Window in front:** The application named by the first action; do not keep an installer, database editor, notebook, and Power BI dialog stacked ambiguously.
- **Repository folder:** C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project when repository work is required. Verify User on your computer.
- **Git branch:** A feature branch, not a detached commit. Run `git branch --show-current` and record the exact result.
- **Database/workspace connection:** The connection named in the action, not merely the most recent connection.
- **Files that should already exist:** Only files from verified earlier phases. Do not pre-create the full tree.
- **Files that should not exist yet:** New Phase 9 files remain absent until their creation lesson.

- **Terminal prompt:** It should end in the expected repository path or another explicitly named folder.
- **Previous verification:** Phase 8 must be verified when this phase has a prerequisite.

Three-level explanation of the phase

Level 1 — Child-simple explanation

Imagine building a store from labeled boxes. This phase handles one box, checks that the label is correct, and makes sure the next box receives the right thing. You do not pour all boxes together and hope the result is understandable.

Level 2 — Northstar Retail project explanation

Phase 9 creates the specific Northstar Retail files, database objects, transformations, tests, model objects, or evidence described in the lessons. Every output keeps a visible connection to its source and batch so you can trace an order, customer, product, campaign, return, shipment, or inventory record.

Level 3 — Professional explanation

This phase establishes a controlled boundary in an end-to-end batch platform. It defines contracts, execution context, idempotency behavior, quality expectations, evidence, and handoff artifacts so the downstream layer can be reproduced and reviewed independently.

Applications to open

Databricks workspace, Catalog Explorer, notebooks, and Jobs-compatible compute. Open only the application needed for the immediate action. Extra windows increase the chance of typing a command into the wrong context.

Phase status gate

☐

I changed this phase from [] Not started to [-] In progress in the master tracker.

☐

I verified the repository root when repository work is required.

☐

I verified the current branch.

☐

I identified the exact server/database, Databricks workspace/catalog/schema, or Power BI file.

☐

I read the phase ordering explanation.

What your screen should look like now

- The Phase 9 lesson index, starting-screen checklist, and three explanation levels remain visible in this workbook.
- Only the applications required for the next lesson are open; no installer, database transaction, notebook run, or Power BI refresh was started merely to read orientation material.
- The intended repository path, active branch, server/database, Databricks workspace, or Power BI file has been written down when it applies.
- No new Phase 9 project file or object has been created yet unless the lesson explicitly instructed you to create it.
- The Phase 9 master-tracker row is marked [-] In progress only after you personally updated it.

Lesson 9.1 completion checklist

☐

I read why Phase 9 happens now — [STATUS]

☐

I can give the child-simple, Northstar-specific, and professional explanations — [STATUS]

☐

I identified the exact applications and execution context required next — [STATUS]

☐

I verified prerequisites instead of assuming they are complete — [STATUS]

I updated the progress tracker myself — [STATUS]

Safe stopping point

No command, database transaction, Databricks run, loader, or Power BI refresh should be active after this orientation lesson. Save any journal note you created. You may close the workbook viewer and applications. When returning, reopen [Lesson 9.2](#), re-read its starting-screen checklist, and verify the repository root, branch, connection, and workspace before performing an action.

[Back to the Phase 9 lesson index](#)

Lesson 9.2 — Perform the notebook-guided actions one at a time

What your screen should look like before starting

The Phase 9 start gate is checked, only the needed application is in front, and the current context has been verified. The following retained lesson material preserves the Northstar terminology and exercise framing; the action cards then turn each hands-on step into a written screen-recording sequence.

Retained phase lesson, exercises, rules, and expected results

Track: Track A required

Ownership status at start: Workbook instructions exist; your execution is not yet verified.

Evidence rule: Replace placeholders only after the verification steps pass.

1. What you are building

Separate Bronze Delta tables for SQL Server extracts, PostgreSQL extracts, CSV feeds, and nested JSON tracking events. Raw values are preserved while source system, file path, ingestion timestamp, batch ID, record hash, unreadable-record quarantine, row counts, and manifest reconciliation are added.

2. Why it matters

Bronze is the replayable evidence layer. Heavy cleaning here would erase the source form and make later rule disputes difficult. The layer should answer which batch/file produced a row and support safe same-batch reruns.

3. Words to know

Term	Plain-language definition
Raw preservation	Keep source values as received wherever readable.
Append-only	New batches are added rather than editing historical raw rows; same-batch replacement is a controlled exception for idempotency.
Record hash	Hash of the raw record used for trace/change evidence.
Input file name	Physical source path recorded per row.
PERMISSIVE mode	Reader captures malformed data where possible rather than silently dropping.
Quarantine	Unreadable records and error context retained outside trusted table.
Delta table	Transactional lakehouse table.
Schema inference	Reader guesses types; Bronze CSV intentionally keeps strings to defer business casting.
Manifest reconciliation	Expected file rows compared to read/written rows.
Rerun	Repeat a batch/task after failure.
Batch replacement	Delete only target rows with same batch ID before append.
Source system	Origin label such as SQLSERVER_ERP, POSTGRES_DIGITAL, FILE_FEED.

4. What must already be completed

Phase 8 environment check passes and the exact batch folder is readable. Source manifest is present. Notebooks 01–03 are synced/imported.

5. Applications to open

Application	How to open it	Why it is open
Databricks workspace	Open notebooks 01, 02, 03.	Run and inspect Bronze ingestion.
Catalog Explorer	Open Bronze and quality schemas.	Preview tables/quarantine and properties.
VS Code	Open the source notebook and Bronze SQL pattern.	Read audit/idempotency functions.
Local manifest	Open in VS Code/browser.	Provide expected row counts/checksums.

6. Exact click-by-click steps

Beginner rhythm: Read the whole step. Confirm the application and location. Perform only that step. Verify the visible result. Record an error before attempting a fix.

7. Exact commands, one code block at a time

8. Where each command runs

Never infer the execution location from the code language. The command headings above identify the application and folder/database/catalog. Before every PowerShell command, run Get-Location; before SQL, verify the selected database; before Spark, print the catalog/schema/batch widgets.

TEACHING EXAMPLE

The following small example or reference pattern explains the concept before you attempt Northstar-specific work. Read it, then complete **MY TASK** without copying the answer.

Line-by-line code explanation

Line or action	Meaning	Why it belongs here
<code>display(spark.table(f"{catalog}. {bronze_schema}.erp_customers").filter(F.col("_batch_id") == batch_id).limit(10))</code>	Shows raw customer rows and audit columns for one batch.	You must visually verify preservation and metadata before Silver.
<code>SELECT _batch_id, COUNT(*) AS rows, COUNT(DISTINCT _record_hash) AS distinct_hashes</code>	Counts Bronze orders by batch and hash.	Detects duplicate batch or duplicate raw rows.
<code>manifest_text = "".join(r.value for r in spark.read.text(f"{batch_root}/ batch_manifest.json").collect())</code>	Reads and parses local extraction manifest from volume.	Bronze must compare against source evidence, not only itself.
<code>SELECT return_date, COUNT(*) AS rows</code>	Shows raw mixed date strings.	Proves Bronze did not force one format.
<code>SELECT * FROM north- star_retail.bronze.file_read_quarantine ORDER BY quarantined_at_utc DESC LIMIT 20;</code>	Inspects unreadable file error evidence.	A failed record/file must remain diagnosable.

Bronze contract

Do: preserve raw values, retain nested structures, add technical metadata, identify batch/file/source, count rows, and fail visibly on unreadable inputs.

Do not: title-case names, validate emails as trusted, parse every date into one business meaning, choose duplicate winners, join sources, calculate profit, or resolve dimension keys. Those are Silver/Gold responsibilities.

Manifest formula

For each readable file: $\text{manifest expected rows} = \text{Bronze rows for that file and batch}$. For malformed records under permissive parsing: $\text{expected rows} = \text{accepted raw rows} + \text{row-level unreadable quarantine}$, with exact reader behavior documented.

MY TASK

Add manifest expected-row validation to each Bronze notebook, demonstrate same-batch idempotency, and document one unreadable-file quarantine test without changing the valid source batch.

STARTER SKELETON

```
def expected_rows(manifest: dict, source_system: str, filename: str) -> int:
    # TODO(USER): find exactly one matching manifest entry.
    matches = [
        item for item in manifest["files"]
        if item["source_system"] == _____ and item["file"].endswith(_____)
    ]
    if len(matches) != 1:
        raise ValueError(_____)
    return int(matches[0]["rows"])

# TODO(USER): compare expected, input DataFrame, and target batch counts.
assert _____ == _____ == _____
```

Acceptance criteria: Every Bronze subject has audit columns, current-batch count matches manifest, same-batch rerun is stable, controlled dirty values remain raw, and unreadable input creates evidence and failure.

HINT 1 — CONCEPT

Match manifest entries by source system plus terminal filename, not an unqualified substring.

HINT 2 — PSEUDOCODE

Compute expected/input/target once and include all values in an assertion message.

HINT 3 — NEAR-COMPLETE PATTERN

Follow `append_once` and add manifest lookup before the write; do not clean values.

13. Expected files or output

- 13 ERP Bronze tables, 6 digital Bronze tables, 4 file Bronze tables.
- Audit fields on all.
- Manifest reconciliation output.
- Stable same-batch count.
- Optional practice quarantine record for unreadable copied input.

14. How to verify

- Batch and file metadata trace every row.
- All source manifest entries have a Bronze outcome.
- Raw issue examples remain unchanged.
- Nested JSON events are visible as nested data.
- No duplicate batch count after rerun.

15. Automated tests

- Manifest-to-Bronze count checks.
- Same-batch before/after count equality.
- Required audit columns/not-null tests.
- Unreadable-path task failure and quarantine test.
- Record-hash stability for unchanged same-batch input.

16. Common errors and exact fixes

Message/symptom	Likely cause	Exact diagnostic	Safe fix	Verify
Path/file not found	Upload structure or widget mismatch.	Print batch_root; ls parent/subfolder; compare manifest.	Correct path/upload; do not hard-code random path.	Reader counts expected file.
Schema inference changed types	Reader options or source file evolved.	printSchema and compare previous batch.	Keep CSV Bronze strings; record additive drift; explicit Silver casts.	Schema drift test documented.
Target doubled on rerun	Batch deletion filter not applied or batch ID changed.	Group target by batch; print parameter.	Use exact stable batch ID and replace only that batch.	Count stable.
Manifest count differs	Wrong file, header count, parsing loss, or manifest method.	Compare source entry/path/input/quarantine/target.	Correct counting/parsing and document malformed behavior; do not alter expected silently.	Equation balances.
JSON corrupt record	Malformed nested feed.	Read with permissive/corrupt-record column and inspect source line.	Quarantine error/record and fail required gate per policy.	No silent loss.

For deeper tool-specific diagnosis, use [the troubleshooting index near the end of this workbook](#).

17. Explain it in your own words

1. Why preserve malformed business values in Bronze?
2. What makes a Bronze rerun safe?
3. How do source manifest and target count differ as evidence?
4. What belongs in unreadable-record quarantine?

Write your answers in the learning-journal fields in this phase. Do not copy the wording above.

18. Mini quiz

1. Which audit field connects all rows to one run?
2. Should Bronze title-case customer names? Why?
3. What equation reconciles a file with quarantined unreadable rows?

Record your answers before opening the answer key.

19. Screenshot checkpoint

Capture one Bronze table with raw defect plus audit columns, manifest reconciliation output, and same-batch count before/after rerun.

Save the image under docs/images/ with a descriptive filename. Check that no credential, token, password, or unnecessary personal account detail is visible.

20. Git checkpoint and suggested commit message

Run `git status`, review the Source Control diff in VS Code, stage only the intended files, then commit:

```
feat: ingest manifest-reconciled bronze delta tables
```

Push the feature branch only after tests pass.

21. Completion checklist

Use one status per item: Not started, In progress, Verified by me, or Needs troubleshooting.

☐

All source types ingested — [STATUS]

☐

Audit columns verified — [STATUS]

☐

Manifest reconciliation added — [STATUS]

☐

Raw preservation checked — [STATUS]

☐

Nested JSON checked — [STATUS]

☐

Same-batch rerun stable — [STATUS]

☐

Unreadable failure/quarantine tested — [STATUS]

Attempt the task and record what failed before reading the optional reference answer in this phase: the optional reference-answer section later in this workbook#phase-9. The quiz answer is in [the answer-key section immediately after the quiz in this workbook#phase-9] (the answer-key section immediately after the quiz in this workbook#phase-9).

Next phase: Phase 10 converts Bronze evidence into typed, standardized, conformed Silver tables and quarantines rule failures.

Required action cards

Action 9.2.1 — Open 01_bronze_sqlserver. Read widget configuration, with_audit_columns, append_once, explicit table list

Application:

Visual Studio Code

Window or panel:

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

Starting condition:

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Open 01_bronze_sqlserver. Read widget configuration, with_audit_columns, append_once, explicit table list. This is one bounded construction or inspection task.

Why this action comes now:

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

Exact physical actions:

1. Bring the application named above to the front and confirm that no unrelated window has focus.
2. Read the starting condition and compare it with what is visible on your screen.
3. Perform only this immediate task: Open 01_bronze_sqlserver. Read widget configuration, with_audit_columns, append_once, explicit table list, and reconciliation assertion.
4. Pause while the application finishes the operation; do not click the same control twice.
5. Inspect the visible result before changing another file, object, or setting.
6. Record the actual result in the verification field for this action.

Command or code:

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

Where to enter it:

Visual Studio Code. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

What each part means:

Step 1

Action

Open `01_bronze_sqlserver`. Read widget configuration, `with_audit_columns`, `append_once`, explicit table list, and reconciliation assertion.

Before continuing

☐

I used the application named in this phase.

☐

I confirmed the current folder/database/catalog/schema.

☐

I can describe what changed on the screen or filesystem.

☐

I know which later verification proves this step worked.

What should happen:

A visible file, folder, branch, connection, table, notebook, task, relationship, measure, visual, or verification result should appear exactly where the action predicts.

Expected example:

Your exact values may differ. The expected result is the same *type* of object and the same required status, not necessarily the same timestamps, row counts, colors, generated IDs, or screen dimensions.

What may look different:

Menu wording can vary by product release or account tier. Use the official-source register and look for the described object rather than guessing from an old screenshot.

How to verify success:

Reopen or refresh the relevant panel, locate the named object, and inspect the property or output that proves it exists and is in the intended location.

Do not continue unless:

You can point to the visible result and explain what it proves. Mark the action `VERIFIED BY USER` only after that check.

Common mistake:

Combining several clicks or decisions, choosing a similarly named object, or continuing because no error dialog appeared.

Exact recovery:

Stop at the current screen. Save a screenshot of the error if useful, hide sensitive values, and compare the selected location with the starting condition. Use Back or Cancel rather than Delete or Overwrite. Correct one mismatch and repeat only this action.

What you just accomplished:

You completed one observable piece of the Northstar Retail platform and established a checkpoint that can be audited later.

How this connects to the project:

The resulting object, decision, or evidence becomes an input to the next stage in the source-to-consumption chain.

[Back to the Phase 9 lesson index](#)

Action 9.2.2 — Confirm every Job/notebook parameter matches Phase 8. Run SQL Server Bronze. Inspect results table and one row

Application:

Databricks workspace in a web browser

Window or panel:

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

Starting condition:

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Confirm every Job/notebook parameter matches Phase 8. Run SQL Server Bronze. Inspect results table and one row. This is one bounded construction or inspection task.

Why this action comes now:

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

Exact physical actions:

1. Bring the application named above to the front and confirm that no unrelated window has focus.
2. Read the starting condition and compare it with what is visible on your screen.
3. Perform only this immediate task: Confirm every Job/notebook parameter matches Phase 8. Run SQL Server Bronze. Inspect results table and one row table schema.
4. Pause while the application finishes the operation; do not click the same control twice.
5. Inspect the visible result before changing another file, object, or setting.
6. Record the actual result in the verification field for this action.

Command or code:

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

Where to enter it:

Databricks workspace in a web browser. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

What each part means:**Step 2****Action**

Confirm every Job/notebook parameter matches Phase 8. Run SQL Server Bronze. Inspect results table and one row table schema.

Before continuing☐

I used the application named in this phase.

☐

I confirmed the current folder/database/catalog/schema.

☐

I can describe what changed on the screen or filesystem.

☐

I know which later verification proves this step worked.

What should happen:

A visible file, folder, branch, connection, table, notebook, task, relationship, measure, visual, or verification result should appear exactly where the action predicts.

Expected example:

Your exact values may differ. The expected result is the same *type* of object and the same required status, not necessarily the same timestamps, row counts, colors, generated IDs, or screen dimensions.

What may look different:

Menu wording can vary by product release or account tier. Use the official-source register and look for the described object rather than guessing from an old screenshot.

How to verify success:

Reopen or refresh the relevant panel, locate the named object, and inspect the property or output that proves it exists and is in the intended location.

Do not continue unless:

You can point to the visible result and explain what it proves. Mark the action VERIFIED BY USER only after that check.

Combining several clicks or decisions, choosing a similarly named object, or continuing because no error dialog appeared.

Exact recovery:

Stop at the current screen. Save a screenshot of the error if useful, hide sensitive values, and compare the selected location with the starting condition. Use Back or Cancel rather than Delete or Overwrite. Correct one mismatch and repeat only this action.

What you just accomplished:

You completed one observable piece of the Northstar Retail platform and established a checkpoint that can be audited later.

How this connects to the project:

The resulting object, decision, or evidence becomes an input to the next stage in the source-to-consumption chain.

[Back to the Phase 9 lesson index](#)

Action 9.2.3 — Open 02_bronze_postgres, run, and inspect timestampz/event source values without standardizing them yet.

Application:

pgAdmin 4 or PostgreSQL psql, as named in the action

Window or panel:

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

Starting condition:

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Open 02_bronze_postgres, run, and inspect timestampz/event source values without standardizing them yet. This is one bounded construction or inspection task.

Why this action comes now:

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

Exact physical actions:

1. Bring the application named above to the front and confirm that no unrelated window has focus.
2. Read the starting condition and compare it with what is visible on your screen.
3. Perform only this immediate task: Open 02_bronze_postgres, run, and inspect timestampz/event source values without standardizing them yet.
4. Pause while the application finishes the operation; do not click the same control twice.
5. Inspect the visible result before changing another file, object, or setting.
6. Record the actual result in the verification field for this action.

Command or code:

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

Where to enter it:

pgAdmin 4 or PostgreSQL psql, as named in the action. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

What each part means:

Step 3

Action

Open 02_bronze_postgres, run, and inspect timestampz/event source values without standardizing them yet.

Before continuing☐

I used the application named in this phase.

☐

I confirmed the current folder/database/catalog/schema.

☐

I can describe what changed on the screen or filesystem.

☐

I know which later verification proves this step worked.

What should happen:

A visible file, folder, branch, connection, table, notebook, task, relationship, measure, visual, or verification result should appear exactly where the action predicts.

Expected example:

Your exact values may differ. The expected result is the same *type* of object and the same required status, not necessarily the same timestamps, row counts, colors, generated IDs, or screen dimensions.

The resulting object, decision, or evidence becomes an input to the next stage in the source-to-consumption chain.

[Back to the Phase 9 lesson index](#)

Action 9.2.9 — Run one same-batch rerun. The notebook deletes only that batch's rows and appends once. Count before/after sho

Application:

Databricks workspace in a web browser

Window or panel:

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

Starting condition:

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Run one same-batch rerun. The notebook deletes only that batch's rows and appends once. Count before/after sho. This is one bounded construction or inspection task.

Why this action comes now:

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

Exact physical actions:

1. Bring the application named above to the front and confirm that no unrelated window has focus.
2. Read the starting condition and compare it with what is visible on your screen.
3. Perform only this immediate task: Run one same-batch rerun. The notebook deletes only that batch's rows and appends once. Count before/after should remain unchanged.
4. Pause while the application finishes the operation; do not click the same control twice.
5. Inspect the visible result before changing another file, object, or setting.
6. Record the actual result in the verification field for this action.

Command or code:

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

Where to enter it:

Databricks workspace in a web browser. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

What each part means:**Step 9****Action**

Run one same-batch rerun. The notebook deletes only that batch's rows and appends once. Count before/after should remain unchanged.

Before continuing☐

I used the application named in this phase.

☐

I confirmed the current folder/database/catalog/schema.

☐

I can describe what changed on the screen or filesystem.

☐

I know which later verification proves this step worked.

What should happen:

A visible file, folder, branch, connection, table, notebook, task, relationship, measure, visual, or verification result should appear exactly where the action predicts.

Expected example:

Your exact values may differ. The expected result is the same *type* of object and the same required status, not necessarily the same timestamps, row counts, colors, generated IDs, or screen dimensions.

What may look different:

Menu wording can vary by product release or account tier. Use the official-source register and look for the described object rather than guessing from an old screenshot.

How to verify success:

Reopen or refresh the relevant panel, locate the named object, and inspect the property or output that proves it exists and is in the intended location.

Do not continue unless:

You can point to the visible result and explain what it proves. Mark the action VERIFIED BY USER only after that check.

Common mistake:

Combining several clicks or decisions, choosing a similarly named object, or continuing because no error dialog appeared.

Exact recovery:

Stop at the current screen. Save a screenshot of the error if useful, hide sensitive values, and compare the selected location with the starting condition. Use Back or Cancel rather than Delete or Overwrite. Correct one mismatch and repeat only this action.

What you just accomplished:

You completed one observable piece of the Northstar Retail platform and established a checkpoint that can be audited later.

How this connects to the project:

The resulting object, decision, or evidence becomes an input to the next stage in the source-to-consumption chain.

[Back to the Phase 9 lesson index](#)

Action 9.2.10 — Simulate an unreadable file only in a disposable copied batch. Verify file_read_quarantine receives context

Application:

Visual Studio Code

Window or panel:

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

Starting condition:

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Simulate an unreadable file only in a disposable copied batch. Verify file_read_quarantine receives context . This is one bounded construction or inspection task.

Why this action comes now:

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

Exact physical actions:

1. Bring the application named above to the front and confirm that no unrelated window has focus.
2. Read the starting condition and compare it with what is visible on your screen.
3. Perform only this immediate task: Simulate an unreadable file only in a disposable copied batch. Verify file_read_quarantine receives context and task fails; restore the valid batch rather than bypassing failure.
4. Pause while the application finishes the operation; do not click the same control twice.
5. Inspect the visible result before changing another file, object, or setting.
6. Record the actual result in the verification field for this action.

Command or code:

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

Where to enter it:

Visual Studio Code. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

What each part means:

Step 10

Action

Simulate an unreadable file only in a disposable copied batch. Verify `file_read_quarantine` receives context and task fails; restore the valid batch rather than bypassing failure.

Before continuing

☐

I used the application named in this phase.

☐

I confirmed the current folder/database/catalog/schema.

☐

I can describe what changed on the screen or filesystem.

☐

I know which later verification proves this step worked.

What should happen:

A visible file, folder, branch, connection, table, notebook, task, relationship, measure, visual, or verification result should appear exactly where the action predicts.

Action 9.2.11 — Record table count, batch ID, source path, and one raw example in the journal.

Application:

Visual Studio Code

Window or panel:

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

Starting condition:

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Record table count, batch ID, source path, and one raw example in the journal. This is one bounded construction or inspection task.

Why this action comes now:

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

Exact physical actions:

1. Bring the application named above to the front and confirm that no unrelated window has focus.
2. Read the starting condition and compare it with what is visible on your screen.
3. Perform only this immediate task: Record table count, batch ID, source path, and one raw example in the journal.
4. Pause while the application finishes the operation; do not click the same control twice.
5. Inspect the visible result before changing another file, object, or setting.
6. Record the actual result in the verification field for this action.

Command or code:

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

Where to enter it:

Visual Studio Code. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

What each part means:**Step 11****Action**

Record table count, batch ID, source path, and one raw example in the journal.

Before continuing☐

I used the application named in this phase.

☐

I confirmed the current folder/database/catalog/schema.

☐

I can describe what changed on the screen or filesystem.

How this connects to the project:

The resulting object, decision, or evidence becomes an input to the next stage in the source-to-consumption chain.

[Back to the Phase 9 lesson index](#)

Action 9.2.C1 — Databricks notebook cell

Application:

Databricks workspace in a web browser

Window or panel:

Databricks notebook cell

Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Run one explained Python instruction and inspect its result before any next command is introduced.

Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

Exact physical actions:

1. CLICK: Bring **Databricks workspace in a web browser** to the front.
2. LOOK FOR: Confirm the current location matches The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

Command or code (Python):

```
display(spark.table(f"{catalog}.{bronze_schema}.erp_customers").filter(F.col("_batch_id") == batch_id).limit(10))
```

Where to enter it:

Databricks notebook cell. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

What each part means:

- **Line 1:** `display(spark.table(f"{catalog}.{bronze_schema}.erp_customers").filter(F.col("_batch_id") == batch_id).limit(10))` — `display` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `(` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `spark.table` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `(` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `f` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `"{catalog}.` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `{bronze_schema}.erp_customers"` is a quoted literal; the quotation marks preserve spaces or mark text; `)` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `==` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `batch_id` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `.` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `limit` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `(` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `10` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `)` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation.

keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `filter` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `()` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `F.col` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `()` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `"_batch_id"` is a quoted literal; the quotation marks preserve spaces or mark text; remaining punctuation and identifiers continue the same statement.

Does it change anything?

This is intended to inspect or validate state rather than change it.

Is it safe to rerun?

Normally safe to rerun because it is observational, but still confirm the execution location first.

What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

Do not continue unless:

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

Common mistake:

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

Exact recovery:

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

What you just accomplished:

You executed and checked one controlled operation rather than treating a long script as a black box.

How this connects to the project:

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 9 lesson index](#)

Action 9.2.C2 — Databricks SQL editor

Application:

Databricks workspace in a web browser

Window or panel:

Databricks SQL editor

Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Run one explained SQL instruction and inspect its result before any next command is introduced.

Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

Exact physical actions:

1. CLICK: Bring **Databricks workspace in a web browser** to the front.
2. LOOK FOR: Confirm the current location matches The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

Command or code (Sql):

```
SELECT _batch_id, COUNT(*) AS rows, COUNT(DISTINCT _record_hash) AS distinct_hashes
FROM northstar_retail.bronze.erp_orders
GROUP BY _batch_id
ORDER BY _batch_id;
```

Where to enter it:

Databricks SQL editor. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

What each part means:

- **Line 1:** `SELECT _batch_id, COUNT(*) AS rows, COUNT(DISTINCT _record_hash) AS distinct_hashes` — `SELECT` requests data without changing it unless combined with a modifying statement; `_batch_id` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `,` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `COUNT` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `(*)` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `AS` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `rows` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `,` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `COUNT` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `(` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `DISTINCT` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `_record_hash` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; remaining punctuation and identifiers continue the same statement.
- **Line 2:** `FROM northstar_retail.bronze.erp_orders` — `FROM` identifies the source table or query; `northstar_retail.bronze.erp_orders` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation
- **Line 3:** `GROUP BY _batch_id` — `GROUP` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `BY` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `_batch_id` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation
- **Line 4:** `ORDER BY _batch_id;` — `ORDER` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `BY` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `_batch_id` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation

Does it change anything?

Action 9.2.C3 — Databricks notebook cell

Application:

Databricks workspace in a web browser

Window or panel:

Databricks notebook cell

Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Run one explained Python instruction and inspect its result before any next command is introduced.

Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

Exact physical actions:

1. CLICK: Bring **Databricks workspace in a web browser** to the front.
2. LOOK FOR: Confirm the current location matches The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

Command or code (Python):

```
manifest_text = "".join(r.value for r in spark.read.text(f"{batch_root}/batch_manifest.json").collect())
import json
manifest = json.loads(manifest_text)
print(manifest["batch_id"], len(manifest["files"]))
```

Where to enter it:

Databricks notebook cell. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

What each part means:

- **Line 1:** `manifest_text = "".join(r.value for r in spark.read.text(f"{batch_root}/batch_manifest.json").collect())` — `manifest_text` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `=` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `" "` is a quoted literal; the quotation marks preserve spaces or mark text; `.` is a path, relative location, branch-style name, or file argument; verify every character before running it; `join` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `(` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `r.value` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `for` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `r` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `in` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `spark.read.text` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `(` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; remaining punctuation and identifiers continue the same statement.
- **Line 2:** `import json` — `import` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `json` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation

Action 9.2.C4 — Databricks SQL editor

Application:

Databricks workspace in a web browser

Window or panel:

Databricks SQL editor

Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Run one explained Sql instruction and inspect its result before any next command is introduced.

Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

Exact physical actions:

1. CLICK: Bring **Databricks workspace in a web browser** to the front.
2. LOOK FOR: Confirm the current location matches The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

Command or code (Sql):

```
SELECT return_date, COUNT(*) AS rows
FROM northstar_retail.bronze.file_returns
WHERE _batch_id = 'EXT-YYYYMMDDTHMMSSZ'
GROUP BY return_date
ORDER BY return_date
LIMIT 20;
```

Where to enter it:

Databricks SQL editor. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

What each part means:

- **Line 1:** `SELECT return_date, COUNT(*) AS rows` — `SELECT` requests data without changing it unless combined with a modifying statement; `return_date` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `,` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `COUNT` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `(*)` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `AS` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `rows` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation
- **Line 2:** `FROM northstar_retail.bronze.file_returns` — `FROM` identifies the source table or query; `northstar_retail.bronze.file_returns` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation
- **Line 3:** `WHERE _batch_id = 'EXT-YYYYMMDDTHMMSSZ'` — `WHERE` filters rows to those meeting a condition; `_batch_id` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `=` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `'EXT-YYYYMMDDTHMMSSZ'` is a quoted literal; the quotation marks preserve spaces or mark text
- **Line 4:** `GROUP BY return_date` — `GROUP` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `BY` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `return_date` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation
- **Line 5:** `ORDER BY return_date` — `ORDER` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `BY` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `return_date` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation
- **Line 6:** `LIMIT 20;` — `LIMIT` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `20` is a numeric literal used by the command or expression

Does it change anything?

This is intended to inspect or validate state rather than change it.

Is it safe to rerun?

Normally safe to rerun because it is observational, but still confirm the execution location first.

What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

Do not continue unless:

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

Common mistake:

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

Exact recovery:

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

What you just accomplished:

You executed and checked one controlled operation rather than treating a long script as a black box.

How this connects to the project:

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 9 lesson index](#)

Action 9.2.C5 — Databricks SQL editor

Application:

Databricks workspace in a web browser

Window or panel:

Databricks SQL editor

Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Run one explained Sql instruction and inspect its result before any next command is introduced.

Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

Exact physical actions:

1. CLICK: Bring **Databricks workspace in a web browser** to the front.
2. LOOK FOR: Confirm the current location matches The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

Command or code (Sql):

```
SELECT * FROM northstar_retail.bronze.file_read_quarantine ORDER BY quarantined_at_utc DESC LIMIT 20;
```

Where to enter it:

Databricks SQL editor. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

What each part means:

- **Line 1:** `SELECT * FROM northstar_retail.bronze.file_read_quarantine ORDER BY quarantined_at_utc DESC LIMIT 20;` — `SELECT` requests data without changing it unless combined with a modifying statement; `*` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `FROM` identifies the source table or query; `northstar_retail.bronze.file_read_quarantine` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `ORDER` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `BY` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `quarantined_at_utc` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `DESC` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `LIMIT` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `20` is a numeric literal used by the command or expression

Does it change anything?

This is intended to inspect or validate state rather than change it.

Is it safe to rerun?

Normally safe to rerun because it is observational, but still confirm the execution location first.

What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

You executed and checked one controlled operation rather than treating a long script as a black box.

How this connects to the project:

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 9 lesson index](#)

What your screen should look like now

Each action you actually performed has a visible result and a recorded ownership status. You have not marked unrun reference commands as complete. The branch, connection, batch, and application context remain known.

Lesson 9.2 completion checklist

☐

I performed actions in order — [STATUS]

☐

I verified each command location — [STATUS]

☐

I distinguished typed text from observed output — [STATUS]

☐

I recorded differences caused by versions/tier — [STATUS]

☐

I stopped at the first unexplained error — [STATUS]

Safe stopping point

Save open work and record the next action number. Close an application only after its operation is complete. On return, re-open the Phase 9 starting-screen checklist and re-verify the active context.

Lesson 9.3 — Create and understand the phase files

What your screen should look like before starting

VS Code Explorer shows the repository root, the intended feature branch is active, and no Phase 9 file is assumed to exist merely because a reference answer appears below. Create each folder only when its first file is needed.

Folder introduction — databricks/

Exact folder name: databricks

Exact parent: repository root

Why it is needed now: Phase 9 is about to place its first responsibility-specific file here; creating it earlier would have produced an unexplained empty structure.

What will eventually be inside: Only files whose purpose matches this folder's name.

Why another folder is not appropriate: Separation keeps source SQL, transformations, tests, configuration, documentation, and generated artifacts reviewable.

Naming rules: Preserve lowercase/uppercase exactly as shown. Hyphens, underscores, spaces, and plural forms create different paths. This project avoids spaces in technical folder names.

VS Code method

1. CLICK: Open Explorer in VS Code.
2. LOOK FOR: Confirm the repository root is the top folder.
3. Expand the parent path repository root one level at a time.
4. RIGHT-CLICK: Right-click the immediate parent folder.
5. CLICK: **New Folder**.
6. TYPE THIS: databricks.
7. PRESS: Enter.
8. LOOK FOR: The folder appears once, at the correct indentation level.

PowerShell method

Action 9.D1.1 — Create the folder databricks

Application:

Databricks workspace in a web browser

Window or panel:

VS Code integrated PowerShell terminal at the repository root

Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

Exact physical actions:

1. CLICK: Bring **Databricks workspace in a web browser** to the front.
2. LOOK FOR: Confirm the current location matches The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

Command or code (PowerShell):

```
New-Item -ItemType Directory -Path ".\databricks" -ErrorAction Stop
```

Where to enter it:

VS Code integrated PowerShell terminal at the repository root. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

What each part means:

- **Line 1:** `New-Item -ItemType Directory -Path ".\databricks" -ErrorAction Stop` — `New-Item` creates a file or folder; `-ItemType` is a command option or flag; its exact behavior is defined beside the command; `Directory` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `-Path` is a command option or flag; its exact behavior is defined beside the command; `".\databricks"` is a path, relat-

ive location, branch-style name, or file argument; verify every character before running it; `-ErrorAction` is a command option or flag; its exact behavior is defined beside the command; `Stop` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation

Does it change anything?

This can change files, Git state, packages, database objects, or data.

Is it safe to rerun?

Safe to rerun only after reading the idempotency note and confirming that the same batch, file, or object will not be duplicated.

What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

Do not continue unless:

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

Common mistake:

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

Exact recovery:

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

What you just accomplished:

You executed and checked one controlled operation rather than treating a long script as a black box.

How this connects to the project:

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 9 lesson index](#)

Folder-creation decision branches**If the folder is created**

Run `Test-Path -LiteralPath ".\databricks" -PathType Container` and require `True`.

If PowerShell says the folder already exists

Do not delete or recreate it. Run `Get-ChildItem -LiteralPath ".\databricks" -Force`, inspect its existing files, and preserve them. Continue only when the existing folder is the intended path.

If the parent path does not exist

Return to the parent-folder tutorial. Create and verify one parent level at a time; do not create the entire future tree in one command.

Verify the folder

1. Run `Test-Path ".\databricks" -PathType Container`.
2. Require the output `True` before creating a child file.

3. Remember: Git does not track an empty folder by itself; the folder becomes visible in Git history when a tracked file is added.

Folder introduction — sql/

Exact folder name: sql

Exact parent: repository root

Why it is needed now: Phase 9 is about to place its first responsibility-specific file here; creating it earlier would have produced an unexplained empty structure.

What will eventually be inside: Only files whose purpose matches this folder's name.

Why another folder is not appropriate: Separation keeps source SQL, transformations, tests, configuration, documentation, and generated artifacts reviewable.

Naming rules: Preserve lowercase/uppercase exactly as shown. Hyphens, underscores, spaces, and plural forms create different paths. This project avoids spaces in technical folder names.

VS Code method

1. CLICK: Open Explorer in VS Code.
2. LOOK FOR: Confirm the repository root is the top folder.
3. Expand the parent path repository root one level at a time.
4. RIGHT-CLICK: Right-click the immediate parent folder.
5. CLICK: **New Folder**.
6. TYPE THIS: sql.
7. PRESS: Enter.
8. LOOK FOR: The folder appears once, at the correct indentation level.

PowerShell method

Action 9.D2.1 — Create the folder sql

Application:

Windows PowerShell or the VS Code PowerShell terminal

Window or panel:

VS Code integrated PowerShell terminal at the repository root

Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

Exact physical actions:

1. CLICK: Bring **Windows PowerShell or the VS Code PowerShell terminal** to the front.
2. LOOK FOR: Confirm the current location matches The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

Command or code (PowerShell):

```
New-Item -ItemType Directory -Path ".\sql" -ErrorAction Stop
```

Where to enter it:

VS Code integrated PowerShell terminal at the repository root. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

If the parent path does not exist

Return to the parent-folder tutorial. Create and verify one parent level at a time; do not create the entire future tree in one command.

Verify the folder

1. Run `Test-Path ".\sql" -PathType Container`.
2. Require the output `True` before creating a child file.
3. Remember: Git does not track an empty folder by itself; the folder becomes visible in Git history when a tracked file is added.

Folder introduction — databricks/notebooks/

Exact folder name: notebooks

Exact parent: databricks

Why it is needed now: Phase 9 is about to place its first responsibility-specific file here; creating it earlier would have produced an unexplained empty structure.

What will eventually be inside: Only files whose purpose matches this folder's name.

Why another folder is not appropriate: Separation keeps source SQL, transformations, tests, configuration, documentation, and generated artifacts reviewable.

Naming rules: Preserve lowercase/uppercase exactly as shown. Hyphens, underscores, spaces, and plural forms create different paths. This project avoids spaces in technical folder names.

VS Code method

1. CLICK: Open Explorer in VS Code.
2. LOOK FOR: Confirm the repository root is the top folder.
3. Expand the parent path `databricks` one level at a time.
4. RIGHT-CLICK: Right-click the immediate parent folder.
5. CLICK: **New Folder**.
6. TYPE THIS: `notebooks`.
7. PRESS: Enter.
8. LOOK FOR: The folder appears once, at the correct indentation level.

PowerShell method

Action 9.D3.1 — Create the folder `databricks/notebooks`

Application:

Databricks workspace in a web browser

Window or panel:

VS Code integrated PowerShell terminal at the repository root

Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

Exact physical actions:

1. CLICK: Bring **Databricks workspace in a web browser** to the front.
2. LOOK FOR: Confirm the current location matches The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

Command or code (PowerShell):

```
New-Item -ItemType Directory -Path ".\databricks\notebooks" -ErrorAction Stop
```

Where to enter it:

VS Code integrated PowerShell terminal at the repository root. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

What each part means:

- **Line 1:** `New-Item -ItemType Directory -Path ".\databricks\notebooks" -ErrorAction Stop` — `New-Item` creates a file or folder; `-ItemType` is a command option or flag; its exact behavior is defined beside the command; `Directory` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `-Path` is a command option or flag; its exact behavior is defined beside the command; `".\databricks\notebooks"` is a path, relative location, branch-style name, or file argument; verify every character before running it; `-ErrorAction` is a command option or flag; its exact behavior is defined beside the command; `Stop` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation

Does it change anything?

This can change files, Git state, packages, database objects, or data.

Is it safe to rerun?

Safe to rerun only after reading the idempotency note and confirming that the same batch, file, or object will not be duplicated.

What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

Do not continue unless:

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

Common mistake:

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

Exact recovery:

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

What you just accomplished:

You executed and checked one controlled operation rather than treating a long script as a black box.

How this connects to the project:

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 9 lesson index](#)

Folder-creation decision branches**If the folder is created**

Run `Test-Path -LiteralPath ".\databricks\notebooks" -PathType Container` and require `True`.

If PowerShell says the folder already exists

Do not delete or recreate it. Run `Get-ChildItem -LiteralPath ".\databricks\notebooks" -Force`, inspect its existing files, and preserve them. Continue only when the existing folder is the intended path.

If the parent path does not exist

Return to the parent-folder tutorial. Create and verify one parent level at a time; do not create the entire future tree in one command.

Verify the folder

1. Run `Test-Path ".\databricks\notebooks" -PathType Container`.
2. Require the output `True` before creating a child file.
3. Remember: Git does not track an empty folder by itself; the folder becomes visible in Git history when a tracked file is added.

Folder introduction — sql/databricks/

Exact folder name: databricks

Exact parent: sql

Why it is needed now: Phase 9 is about to place its first responsibility-specific file here; creating it earlier would have produced an unexplained empty structure.

What will eventually be inside: Only files whose purpose matches this folder's name.

Why another folder is not appropriate: Separation keeps source SQL, transformations, tests, configuration, documentation, and generated artifacts reviewable.

Naming rules: Preserve lowercase/uppercase exactly as shown. Hyphens, underscores, spaces, and plural forms create different paths. This project avoids spaces in technical folder names.

VS Code method

1. CLICK: Open Explorer in VS Code.
2. LOOK FOR: Confirm the repository root is the top folder.
3. Expand the parent path `sql` one level at a time.
4. RIGHT-CLICK: Right-click the immediate parent folder.
5. CLICK: **New Folder**.
6. TYPE THIS: `databricks`.
7. PRESS: Enter.
8. LOOK FOR: The folder appears once, at the correct indentation level.

PowerShell method**Action 9.D4.1 — Create the folder sql/databricks**

Application:

Databricks workspace in a web browser

Window or panel:

VS Code integrated PowerShell terminal at the repository root

Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

Exact physical actions:

1. CLICK: Bring **Databricks workspace in a web browser** to the front.
2. LOOK FOR: Confirm the current location matches The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

Command or code (PowerShell):

```
New-Item -ItemType Directory -Path ".\sql\databricks" -ErrorAction Stop
```

Where to enter it:

VS Code integrated PowerShell terminal at the repository root. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

What each part means:

- **Line 1:** `New-Item -ItemType Directory -Path ".\sql\databricks" -ErrorAction Stop` — `New-Item` creates a file or folder; `-ItemType` is a command option or flag; its exact behavior is defined beside the command; `Directory` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `-Path` is a command option or flag; its exact behavior is defined beside the command; `.\sql\databricks` is a path, relative location, branch-style name, or file argument; verify every character before running it; `-ErrorAction` is a command option or flag; its exact behavior is defined beside the command; `Stop` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation

Does it change anything?

This can change files, Git state, packages, database objects, or data.

Is it safe to rerun?

Safe to rerun only after reading the idempotency note and confirming that the same batch, file, or object will not be duplicated.

What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

Do not continue unless:

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

Common mistake:

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

Exact recovery:

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

What you just accomplished:

You executed and checked one controlled operation rather than treating a long script as a black box.

How this connects to the project:

This verified state becomes a dependable input to the next Northstar Retail construction action.

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 9 lesson index](#)

Folder-creation decision branches**If the folder is created**

Run `Test-Path -LiteralPath ".\sql\databricks\bronze" -PathType Container` and require `True`.

If PowerShell says the folder already exists

Do not delete or recreate it. Run `Get-ChildItem -LiteralPath ".\sql\databricks\bronze" -Force`, inspect its existing files, and preserve them. Continue only when the existing folder is the intended path.

If the parent path does not exist

Return to the parent-folder tutorial. Create and verify one parent level at a time; do not create the entire future tree in one command.

Verify the folder

1. Run `Test-Path ".\sql\databricks\bronze" -PathType Container`.
2. Require the output `True` before creating a child file.
3. Remember: Git does not track an empty folder by itself; the folder becomes visible in Git history when a tracked file is added.

File introduction — databricks/notebooks/01_bronze_sqlserver.py

Exact filename: `01_bronze_sqlserver.py`

Filename extension: `.py`. In this project it identifies executable Python logic and helps the correct application choose syntax

highlighting or execution behavior.

Exact parent folder: databricks/notebooks relative to the repository root.

Why this file belongs there: Files with the same responsibility are grouped so a reviewer can find configuration, source SQL, transformations, tests, documentation, and report assets without guessing.

What the file will contain: executable Python logic for Phase 9.

Later dependencies: Later phase commands, tests, GitHub Actions, Databricks tasks, warehouse loads, Power BI work, or portfolio evidence may depend on its exact path.

Should Git track it? Yes, unless the lesson explicitly identifies it as generated data, a local secret, a log, or a machine-specific artifact.

Could it contain secrets? It should not contain live passwords, tokens, connection strings, or account identifiers.

What happens if it is missing: The corresponding phase cannot be reproduced, validated, or explained from the repository alone.

VS Code click path

1. CLICK: In VS Code, open **Explorer** from the left Activity Bar.
2. LOOK FOR: Confirm the top-level folder name is SQL-Data-Warehouse-Project and the status bar shows the intended Git branch.
3. CLICK: Expand each parent folder in databricks/notebooks one level at a time.
4. If a parent folder does not exist, use the folder tutorial in this phase before creating the file.
5. RIGHT-CLICK: Right-click the immediate parent folder.
6. CLICK: Select **New File**.
7. TYPE THIS: 01_bronze_sqlserver.py.
8. PRESS: Enter.
9. LOOK FOR: A new editor tab labeled 01_bronze_sqlserver.py and an empty file under the correct parent folder.
10. PRESS: Ctrl+S after adding each explained section.

PowerShell path

Action 9.F1.1 — Create the file databricks/notebooks/01_bronze_sqlserver.py from PowerShell

Application:

Databricks workspace in a web browser

Window or panel:

VS Code integrated PowerShell terminal opened at the repository root

Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

Exact physical actions:

1. CLICK: Bring **Databricks workspace in a web browser** to the front.
2. LOOK FOR: Confirm the current location matches The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

Command or code (PowerShell):

```
New-Item -ItemType File -Path ".\databricks\notebooks\01_bronze_sqlserver.py" -ErrorAction Stop
```

Where to enter it:

VS Code integrated PowerShell terminal opened at the repository root. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

What each part means:

- **Line 1:** `New-Item -ItemType File -Path ".\databricks\notebooks\01_bronze_sqlserver.py" -ErrorAction Stop` — `New-Item` creates a file or folder; `-ItemType` is a command option or flag; its exact behavior is defined beside the command; `File` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `-Path` is a command option or flag; its exact behavior is defined beside the command; `".\databricks\notebooks\01_bronze_sqlserver.py"` is a path, relative location, branch-style name, or file argument; verify every character before running it; `-ErrorAction` is a command option or flag; its exact behavior is defined beside the command; `Stop` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation

Does it change anything?

This can change files, Git state, packages, database objects, or data.

Is it safe to rerun?

Safe to rerun only after reading the idempotency note and confirming that the same batch, file, or object will not be duplicated.

What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

Do not continue unless:

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

Common mistake:

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

Exact recovery:

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

What you just accomplished:

You executed and checked one controlled operation rather than treating a long script as a black box.

How this connects to the project:

This verified state becomes a dependable input to the next Northstar Retail construction action.

File-creation decision branches

If the command creates the file

Run `Test-Path -LiteralPath ".\databricks\notebooks\01_bronze_sqlserver.py" -PathType Leaf`. Continue only when it returns True and the file is empty because you just created it.

If PowerShell says the file already exists

Do not add `-Force`, do not clear the file, and do not overwrite it. Open the existing file in VS Code, run `git status --short -- "databricks/notebooks/01_bronze_sqlserver.py"`, inspect its contents and Git history, and decide whether this lesson should edit the preserved file rather than create a new one.

If PowerShell says part of the path does not exist

Stop. Create only the missing parent folder through the earlier folder tutorial, verify it with `Test-Path -PathType Container`, and rerun this one file command.

File-content construction

1. Start with the smallest header, comment, or first section shown in the phase lesson.
2. Read the purpose before typing the section.
3. Add one logical section at a time.
4. Save with `Ctrl+S`.
5. Run the syntax or content validation named in the phase.
6. Correct the first error before adding another section.
7. Use `TODD(USER)` where the workbook requires your own decision or verified value.

File verification

1. In the VS Code Explorer, confirm the file appears under `databricks/notebooks`.
2. Right-click the editor tab and choose **Copy Path**; compare the ending with `databricks/notebooks/01_bronze_sqlserver.py`.
3. In PowerShell at the repository root, run `Test-Path ".\databricks\notebooks\01_bronze_sqlserver.py"` and require True.
4. Run `git status --short -- "databricks/notebooks/01_bronze_sqlserver.py"` to see only this file's Git state.
5. Run the phase-specific validator before committing.

Optional reference answer for `databricks/notebooks/01_bronze_sqlserver.py`

Attempt the file construction first. This reference is learning material, not evidence that you created or ran the file.

Language: Python

Exact file: `databricks/notebooks/01_bronze_sqlserver.py`

Purpose: executable Python logic.

Inputs: The requirements, configuration, source data, or upstream objects described in Phase 9.

Expected outputs: The file's declared objects, logs, tables, checks, or documentation when the user later runs or reads it.

```
# Databricks notebook source
# Northstar Retail End-to-End Data Platform
# This file is a Git-friendly Databricks source notebook.
# Track A reads files that you manually uploaded to a Unity Catalog volume.
# It never attempts to reach SQL Server or PostgreSQL on localhost.

# COMMAND -----
# MAGIC %md
# MAGIC # 01 – Bronze SQL Server extracts
# MAGIC Reads Track A Parquet extracts from the uploaded volume; SQL Server itself remains local.

# COMMAND -----

from __future__ import annotations
from datetime import datetime, timezone
from functools import reduce

File introduction — databricks/notebooks/02_bronze_postgres.py

Exact filename: 02_bronze_postgres.py

Filename extension: .py. In this project it identifies executable Python logic and helps the correct application choose syntax highlighting or execution behavior.

Exact parent folder: databricks/notebooks relative to the repository root.

Why this file belongs there: Files with the same responsibility are grouped so a reviewer can find configuration, source SQL, transformations, tests, documentation, and report assets without guessing.

What the file will contain: executable Python logic for Phase 9.

Later dependencies: Later phase commands, tests, GitHub Actions, Databricks tasks, warehouse loads, Power BI work, or portfolio evidence may depend on its exact path.

Should Git track it? Yes, unless the lesson explicitly identifies it as generated data, a local secret, a log, or a machine-specific artifact.

Could it contain secrets? It should not contain live passwords, tokens, connection strings, or account identifiers.

What happens if it is missing: The corresponding phase cannot be reproduced, validated, or explained from the repository alone.

VS Code click path

1. CLICK: In VS Code, open **Explorer** from the left Activity Bar.
2. LOOK FOR: Confirm the top-level folder name is SQL-Data-Warehouse-Project and the status bar shows the intended Git branch.
3. CLICK: Expand each parent folder in databricks/notebooks one level at a time.
4. If a parent folder does not exist, use the folder tutorial in this phase before creating the file.
5. RIGHT-CLICK: Right-click the immediate parent folder.
6. CLICK: Select **New File**.
7. TYPE THIS: 02_bronze_postgres.py.
8. PRESS: Enter.
9. LOOK FOR: A new editor tab labeled 02_bronze_postgres.py and an empty file under the correct parent folder.
10. PRESS: Ctrl+S after adding each explained section.

PowerShell path

Action 9.F2.1 — Create the file databricks/notebooks/02_bronze_postgres.py from PowerShell

Application:

Databricks workspace in a web browser

Window or panel:

VS Code integrated PowerShell terminal opened at the repository root

Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

Exact physical actions:

1. CLICK: Bring **Databricks workspace in a web browser** to the front.
2. LOOK FOR: Confirm the current location matches The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

Command or code (PowerShell):

```
New-Item -ItemType File -Path ".\databricks\notebooks\02_bronze_postgres.py" -ErrorAction Stop
```

Where to enter it:

VS Code integrated PowerShell terminal opened at the repository root. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

What each part means:

- **Line 1:** `New-Item -ItemType File -Path ".\databricks\notebooks\02_bronze_postgres.py" -ErrorAction Stop` — `New-Item` creates a file or folder; `-ItemType` is a command option or flag; its exact behavior is defined beside the command; `File` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `-Path` is a command option or flag; its exact behavior is defined beside the command; `".\databricks\notebooks\02_bronze_postgres.py"` is a path, relative location, branch-style name, or file argument; verify every character before running it; `-ErrorAction` is a command option or flag; its exact behavior is defined beside the command; `Stop` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation

Does it change anything?

This can change files, Git state, packages, database objects, or data.

Is it safe to rerun?

Safe to rerun only after reading the idempotency note and confirming that the same batch, file, or object will not be duplicated.

What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

Do not continue unless:

The result is visible, understandable, and recorded as RUN BY USER or VERIFIED BY USER. Displaying this workbook does not count as execution.

Common mistake:

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

Exact recovery:

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

What you just accomplished:

You executed and checked one controlled operation rather than treating a long script as a black box.

How this connects to the project:

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 9 lesson index](#)

File-creation decision branches**If the command creates the file**

Run `Test-Path -LiteralPath ".\databricks\notebooks\02_bronze_postgres.py" -PathType Leaf`. Continue only when it returns True and the file is empty because you just created it.

If PowerShell says the file already exists

Do not add `-Force`, do not clear the file, and do not overwrite it. Open the existing file in VS Code, run `git status --short -- "databricks/notebooks/02_bronze_postgres.py"`, inspect its contents and Git history, and decide whether this lesson should edit the preserved file rather than create a new one.

If PowerShell says part of the path does not exist

Stop. Create only the missing parent folder through the earlier folder tutorial, verify it with `Test-Path -PathType Container`, and rerun this one file command.

File-content construction

1. Start with the smallest header, comment, or first section shown in the phase lesson.
2. Read the purpose before typing the section.
3. Add one logical section at a time.
4. Save with Ctrl+S.
5. Run the syntax or content validation named in the phase.
6. Correct the first error before adding another section.
7. Use `TODO(USER)` where the workbook requires your own decision or verified value.

File verification

1. In the VS Code Explorer, confirm the file appears under `databricks/notebooks`.
2. Right-click the editor tab and choose **Copy Path**; compare the ending with `databricks/notebooks/02_bronze_postgres.py`.
3. In PowerShell at the repository root, run `Test-Path ".\databricks\notebooks\02_bronze_postgres.py"` and require True.
4. Run `git status --short -- "databricks/notebooks/02_bronze_postgres.py"` to see only this file's Git state.
5. Run the phase-specific validator before committing.

Optional reference answer for databricks/notebooks/02_bronze_postgres.py

Attempt the file construction first. This reference is learning material, not evidence that you created or ran the file.

Language: Python

Exact file: `databricks/notebooks/02_bronze_postgres.py`

Purpose: executable Python logic.

Inputs: The requirements, configuration, source data, or upstream objects described in Phase 9.

Expected outputs: The file's declared objects, logs, tables, checks, or documentation when the user later runs or reads it.

```
# Databricks notebook source
# Northstar Retail End-to-End Data Platform
```

```

# This file is a Git-friendly Databricks source notebook.
# Track A reads files that you manually uploaded to a Unity Catalog volume.
# It never attempts to reach SQL Server or PostgreSQL on localhost.

# COMMAND -----
# MAGIC %md
# MAGIC # 02 – Bronze PostgreSQL extracts
# MAGIC Reads Track A Parquet extracts from the uploaded volume; PostgreSQL itself remains local.

# COMMAND -----

File introduction — databricks/notebooks/03_bronze_files.py

Exact filename: 03_bronze_files.py

Filename extension: .py. In this project it identifies executable Python logic and helps the correct application choose syntax highlighting or execution behavior.

Exact parent folder: databricks/notebooks relative to the repository root.

Why this file belongs there: Files with the same responsibility are grouped so a reviewer can find configuration, source SQL, transformations, tests, documentation, and report assets without guessing.

What the file will contain: executable Python logic for Phase 9.

Later dependencies: Later phase commands, tests, GitHub Actions, Databricks tasks, warehouse loads, Power BI work, or portfolio evidence may depend on its exact path.

Should Git track it? Yes, unless the lesson explicitly identifies it as generated data, a local secret, a log, or a machine-specific artifact.

Could it contain secrets? It should not contain live passwords, tokens, connection strings, or account identifiers.

What happens if it is missing: The corresponding phase cannot be reproduced, validated, or explained from the repository alone.

VS Code click path

1. CLICK: In VS Code, open **Explorer** from the left Activity Bar.
2. LOOK FOR: Confirm the top-level folder name is SQL-Data-Warehouse-Project and the status bar shows the intended Git branch.
3. CLICK: Expand each parent folder in databricks/notebooks one level at a time.
4. If a parent folder does not exist, use the folder tutorial in this phase before creating the file.
5. RIGHT-CLICK: Right-click the immediate parent folder.
6. CLICK: Select **New File**.
7. TYPE THIS: 03_bronze_files.py.
8. PRESS: Enter.
9. LOOK FOR: A new editor tab labeled 03_bronze_files.py and an empty file under the correct parent folder.
10. PRESS: Ctrl+S after adding each explained section.

PowerShell path

Action 9.F3.1 — Create the file databricks/notebooks/03_bronze_files.py from PowerShell

Application:

Databricks workspace in a web browser

Window or panel:

VS Code integrated PowerShell terminal opened at the repository root

Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

Exact physical actions:

1. CLICK: Bring **Databricks workspace in a web browser** to the front.
2. LOOK FOR: Confirm the current location matches The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.

4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

Command or code (PowerShell):

```
New-Item -ItemType File -Path ".\databricks\notebooks\03_bronze_files.py" -ErrorAction Stop
```

Where to enter it:

VS Code integrated PowerShell terminal opened at the repository root. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

What each part means:

- **Line 1:** `New-Item -ItemType File -Path ".\databricks\notebooks\03_bronze_files.py" -ErrorAction Stop` — `New-Item` creates a file or folder; `-ItemType` is a command option or flag; its exact behavior is defined beside the command; `File` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `-Path` is a command option or flag; its exact behavior is defined beside the command; `".\databricks\notebooks\03_bronze_files.py"` is a path, relative location, branch-style name, or file argument; verify every character before running it; `-ErrorAction` is a command option or flag; its exact behavior is defined beside the command; `Stop` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation

Does it change anything?

This can change files, Git state, packages, database objects, or data.

Is it safe to rerun?

Safe to rerun only after reading the idempotency note and confirming that the same batch, file, or object will not be duplicated.

What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

Do not continue unless:

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

Common mistake:

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

Exact recovery:

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

What you just accomplished:

You executed and checked one controlled operation rather than treating a long script as a black box.

How this connects to the project:

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 9 lesson index](#)

File-creation decision branches

If the command creates the file

Run `Test-Path -LiteralPath ".\databricks\notebooks\03_bronze_files.py" -PathType Leaf`. Continue only when it returns True and the file is empty because you just created it.

If PowerShell says the file already exists

Do not add `-Force`, do not clear the file, and do not overwrite it. Open the existing file in VS Code, run `git status --short -- "databricks/notebooks/03_bronze_files.py"`, inspect its contents and Git history, and decide whether this lesson should edit the preserved file rather than create a new one.

If PowerShell says part of the path does not exist

Stop. Create only the missing parent folder through the earlier folder tutorial, verify it with `Test-Path -PathType Container`, and rerun this one file command.

File-content construction

1. Start with the smallest header, comment, or first section shown in the phase lesson.
2. Read the purpose before typing the section.
3. Add one logical section at a time.
4. Save with `Ctrl+S`.
5. Run the syntax or content validation named in the phase.
6. Correct the first error before adding another section.
7. Use `TODO(USER)` where the workbook requires your own decision or verified value.

File verification

1. In the VS Code Explorer, confirm the file appears under `databricks/notebooks`.
2. Right-click the editor tab and choose **Copy Path**; compare the ending with `databricks/notebooks/03_bronze_files.py`.
3. In PowerShell at the repository root, run `Test-Path ".\databricks\notebooks\03_bronze_files.py"` and require True.
4. Run `git status --short -- "databricks/notebooks/03_bronze_files.py"` to see only this file's Git state.
5. Run the phase-specific validator before committing.

Optional reference answer for databricks/notebooks/03_bronze_files.py

Attempt the file construction first. This reference is learning material, not evidence that you created or ran the file.

Language: Python

Exact file: `databricks/notebooks/03_bronze_files.py`

Purpose: executable Python logic.

Inputs: The requirements, configuration, source data, or upstream objects described in Phase 9.

Expected outputs: The file's declared objects, logs, tables, checks, or documentation when the user later runs or reads it.

```
# Databricks notebook source
# Northstar Retail End-to-End Data Platform
# This file is a Git-friendly Databricks source notebook.
# Track A reads files that you manually uploaded to a Unity Catalog volume.
# It never attempts to reach SQL Server or PostgreSQL on localhost.

# COMMAND -----
# MAGIC %md
# MAGIC # 03 – Bronze file feeds
# MAGIC CSV values remain strings in Bronze. Nested tracking JSON is preserved and parsed as a struct/array.

# COMMAND -----

- **Line 84:** `dbutils.jobs.taskValues.set(key="bronze_files_status", value="PASS")` — `dbutils.jobs.taskValues.set` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `(` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `key` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `=` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `"bronze_files_status"` is a quoted literal; the quotation marks preserve spaces or mark text; `,` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `value` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `=` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `"PASS"` is a quoted literal; the quotation marks preserve spaces or mark text; `)` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation

[Back to the Phase 9 lesson index](#)

File introduction — `sql/databricks/bronze/01_bronze_audit_pattern.sql`

Exact filename: `01_bronze_audit_pattern.sql`

Filename extension: `.sql`. In this project it identifies database or lakehouse definitions and queries and helps the correct application choose syntax highlighting or execution behavior.

Exact parent folder: `sql/databricks/bronze` relative to the repository root.

Why this file belongs there: Files with the same responsibility are grouped so a reviewer can find configuration, source SQL, transformations, tests, documentation, and report assets without guessing.

What the file will contain: database or lakehouse definitions and queries for Phase 9.

Later dependencies: Later phase commands, tests, GitHub Actions, Databricks tasks, warehouse loads, Power BI work, or portfolio evidence may depend on its exact path.

Should Git track it? Yes, unless the lesson explicitly identifies it as generated data, a local secret, a log, or a machine-specific artifact.

Could it contain secrets? It should not contain live passwords, tokens, connection strings, or account identifiers.

What happens if it is missing: The corresponding phase cannot be reproduced, validated, or explained from the repository alone.

VS Code click path

1. CLICK: In VS Code, open **Explorer** from the left Activity Bar.
2. LOOK FOR: Confirm the top-level folder name is SQL-Data-Warehouse-Project and the status bar shows the intended Git branch.
3. CLICK: Expand each parent folder in sql/databricks/bronze one level at a time.
4. If a parent folder does not exist, use the folder tutorial in this phase before creating the file.
5. RIGHT-CLICK: Right-click the immediate parent folder.
6. CLICK: Select **New File**.
7. TYPE THIS: 01_bronze_audit_pattern.sql.
8. PRESS: Enter.
9. LOOK FOR: A new editor tab labeled 01_bronze_audit_pattern.sql and an empty file under the correct parent folder.
10. PRESS: Ctrl+S after adding each explained section.

PowerShell path

Action 9.F4.1 — Create the file sql/databricks/bronze/01_bronze_audit_pattern.sql from PowerShell

Application:

Databricks workspace in a web browser

Window or panel:

VS Code integrated PowerShell terminal opened at the repository root

Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

Exact physical actions:

1. CLICK: Bring **Databricks workspace in a web browser** to the front.
2. LOOK FOR: Confirm the current location matches The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

Command or code (PowerShell):

```
New-Item -ItemType File -Path ".\sql\databricks\bronze\01_bronze_audit_pattern.sql" -ErrorAction Stop
```

Where to enter it:

VS Code integrated PowerShell terminal opened at the repository root. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

What each part means:

- **Line 1:** `New-Item -ItemType File -Path ".\sql\databricks\bronze\01_bronze_audit_pattern.sql" -ErrorAction Stop` — `New-Item` creates a file or folder; `-ItemType` is a command option or flag; its exact behavior is defined beside the command; `File` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `-Path` is a command option or flag; its exact behavior is defined beside the command; `".\sql\databricks\bronze\01_bronze_audit_pattern.sql"` is a path, relative location, branch-style name, or file argument; verify every character before running it; `-ErrorAction` is a command option or flag; its exact behavior is defined beside the command; `Stop` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation

Does it change anything?

This can change files, Git state, packages, database objects, or data.

Is it safe to rerun?

Safe to rerun only after reading the idempotency note and confirming that the same batch, file, or object will not be duplicated.

What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

Do not continue unless:

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

Common mistake:

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

Exact recovery:

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

What you just accomplished:

You executed and checked one controlled operation rather than treating a long script as a black box.

How this connects to the project:

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 9 lesson index](#)

File-creation decision branches**If the command creates the file**

Run `Test-Path -LiteralPath ".\sql\databricks\bronze\01_bronze_audit_pattern.sql" -PathType Leaf`. Continue only when it returns `True` and the file is empty because you just created it.

If PowerShell says the file already exists

Do not add -Force, do not clear the file, and do not overwrite it. Open the existing file in VS Code, run `git status --short -- "sql/databricks/bronze/01_bronze_audit_pattern.sql"`, inspect its contents and Git history, and decide whether this lesson should edit the preserved file rather than create a new one.

If PowerShell says part of the path does not exist

Stop. Create only the missing parent folder through the earlier folder tutorial, verify it with `Test-Path -PathType Container`, and rerun this one file command.

File-content construction

1. Start with the smallest header, comment, or first section shown in the phase lesson.
2. Read the purpose before typing the section.
3. Add one logical section at a time.
4. Save with Ctrl+S.
5. Run the syntax or content validation named in the phase.
6. Correct the first error before adding another section.
7. Use `TODD(USER)` where the workbook requires your own decision or verified value.

File verification

1. In the VS Code Explorer, confirm the file appears under `sql/databricks/bronze`.
2. Right-click the editor tab and choose **Copy Path**; compare the ending with `sql/databricks/bronze/01_bronze_audit_pattern.sql`.
3. In PowerShell at the repository root, run `Test-Path ".\sql\databricks\bronze\01_bronze_audit_pattern.sql"` and require True.
4. Run `git status --short -- "sql/databricks/bronze/01_bronze_audit_pattern.sql"` to see only this file's Git state.
5. Run the phase-specific validator before committing.

Optional reference answer for `sql/databricks/bronze/01_bronze_audit_pattern.sql`

Attempt the file construction first. This reference is learning material, not evidence that you created or ran the file.

Language: SQL

Exact file: `sql/databricks/bronze/01_bronze_audit_pattern.sql`

Purpose: database or lakehouse definitions and queries.

Inputs: The requirements, configuration, source data, or upstream objects described in Phase 9.

Expected outputs: The file's declared objects, logs, tables, checks, or documentation when the user later runs or reads it.

```
-- Dialect: Databricks SQL / Spark SQL
-- Teaching pattern. The runnable Bronze implementation is in databricks/notebooks/01-03.
SELECT
  source.*,
  input_file_name() AS _source_file,
  current_timestamp() AS _ingested_at_utc,
  '${batch_id}' AS _batch_id,
  sha2(to_json(struct(source.*)), 256) AS _record_hash
FROM read_files('${input_path}', format => 'parquet') AS source;
```

Line-by-line explanation

- **Line 1:** `-- Dialect: Databricks SQL / Spark SQL` is a comment for a human reader; it normally does not change data or execute business logic.
- **Line 2:** `-- Teaching pattern. The runnable Bronze implementation is in databricks/notebooks/01-03.` is a comment for a human reader; it normally does not change data or execute business logic.
- **Line 3:** `SELECT` — `SELECT` requests data without changing it unless combined with a modifying statement
- **Line 4:** `source.*`, — `source` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `.*`, is a path, relative location, branch-style name, or file argument; verify every character before running it
- **Line 5:** `input_file_name() AS _source_file`, — `input_file_name` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `()` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `AS` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `_source_file` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `,` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation

- **Line 6:** `current_timestamp()` AS `_ingested_at_utc`, — `current_timestamp` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `()` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `AS` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `_ingested_at_utc` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `,` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation
- **Line 7:** `'${batch_id}'` AS `_batch_id`, — `'${batch_id}'` is a quoted literal; the quotation marks preserve spaces or mark text; `AS` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `_batch_id` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `,` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation
- **Line 8:** `sha2(to_json(struct(source.*)), 256)` AS `_record_hash` — `sha2` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `(` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `to_json` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `(` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `struct` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `(` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `source` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `.*`) is a path, relative location, branch-style name, or file argument; verify every character before running it; `256` is a numeric literal used by the command or expression; `)` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `AS` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `_record_hash` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation
- **Line 9:** `FROM read_files('${input_path}', format => 'parquet')` AS `source`; — `FROM` identifies the source table or query; `read_files` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `(` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `'${input_path}'` is a quoted literal; the quotation marks preserve spaces or mark text; `,` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `format` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `=>` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `'parquet'` is a quoted literal; the quotation marks preserve spaces or mark text; `)` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `AS` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `source` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation

[Back to the Phase 9 lesson index](#)

What your screen should look like now

- Every Phase 9 file you actually created appears under the correct parent folder.
- Your open editor tab matches the file you are validating.
- The Git branch has not changed unexpectedly.
- `git status --short` lists only expected work.
- Reference answers remain reference material; your status fields are not automatically completed.

Lesson 9.3 completion checklist

☐

`databricks/notebooks/01_bronze_sqlserver.py` was created by me, saved, located correctly, and inspected — [STATUS]

☐

`databricks/notebooks/02_bronze_postgres.py` was created by me, saved, located correctly, and inspected — [STATUS]

☐

`databricks/notebooks/03_bronze_files.py` was created by me, saved, located correctly, and inspected — [STATUS]

☐

`sql/databricks/bronze/01_bronze_audit_pattern.sql` was created by me, saved, located correctly, and inspected — [STATUS]

Safe stopping point

Save every open file with Ctrl+S. You may close VS Code only after `git status --short` is recorded in your journal. The terminal may be closed when no installer, transaction, Python process, Databricks run, warehouse load, or Power BI refresh is active. Resume at [Lesson 9.4](#) and recheck the root and branch.

Lesson 9.4 — Build and validate required objects

What your screen should look like before starting

The phase files are saved, the correct application and connection are visible, and the upstream input has passed its verification gate. Build one object at a time; do not create many objects and inspect them only at the end.

Bronze object 1 — `bronze.erp_product_categories`

Input: `product_categories.csv` or the equivalent entity extract in the uploaded Track A batch.

Target: Delta table `bronze.erp_product_categories`.

Responsibility: Preserve raw source columns while adding ingestion metadata; Bronze is not the place for business cleaning.

Grain: One Bronze row per input record for `product_categories` in one batch.

Required metadata: `_batch_id`, `_source_file`, `_ingested_at`, and source/system identifiers used by the project audit pattern.

Schema rule: Capture or declare the source shape deliberately. Unexpected columns/types must be visible, not silently discarded.

Rerun rule: Test the same batch twice. The implementation must either reject duplicate batch ingestion or prove a controlled idempotent strategy; unbounded append is not acceptable evidence.

Action 9.4.B1 — Ingest `product_categories` into `bronze.erp_product_categories`

Application:

Databricks workspace in a web browser

Window or panel:

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

Starting condition:

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Ingest `product_categories` into `bronze.erp_product_categories`. This is one bounded construction or inspection task.

Why this action comes now:

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

Exact physical actions:

1. CLICK: Open `databricks/notebooks/01_bronze_sqlserver.py` in the Databricks workspace or Git folder.
2. LOOK FOR: Confirm the notebook language is Python and the expected compute is attached or serverless is available.
3. LOOK FOR: Confirm the widget/parameter `batch_id` equals the uploaded batch folder exactly.
4. CLICK: Add or locate the entity-specific ingestion cell for `product_categories`.
5. TYPE THIS: Construct the entity path and target table from parameters; do not hard-code another user's catalog.
6. PRESS: Run the inspection cell first and display the raw schema and sample rows.
7. PRESS: Run the write cell only after the manifest entry and schema are understood.
8. LOOK FOR: A completed cell, a Delta target in Catalog Explorer, and the current batch metadata columns.
9. PRESS: Run the independent source-versus-Bronze count query.
10. DO NOT CONTINUE UNTIL: Row counts and batch ID match and a rerun test has a documented result.

Command or code:

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

Where to enter it:

Databricks workspace in a web browser. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

What each part means:

1. CLICK: Open `databricks/notebooks/01_bronze_sqlserver.py` in the Databricks workspace or Git folder.
2. LOOK FOR: Confirm the notebook language is Python and the expected compute is attached or serverless is available.
3. LOOK FOR: Confirm the widget/parameter `batch_id` equals the uploaded batch folder exactly.
4. CLICK: Add or locate the entity-specific ingestion cell for `product_categories`.
5. TYPE THIS: Construct the entity path and target table from parameters; do not hard-code another user's catalog.
6. PRESS: Run the inspection cell first and display the raw schema and sample rows.
7. PRESS: Run the write cell only after the manifest entry and schema are understood.
8. LOOK FOR: A completed cell, a Delta target in Catalog Explorer, and the current batch metadata columns.
9. PRESS: Run the independent source-versus-Bronze count query.
10. DO NOT CONTINUE UNTIL: Row counts and batch ID match and a rerun test has a documented result.

What should happen:

A visible file, folder, branch, connection, table, notebook, task, relationship, measure, visual, or verification result should appear exactly where the action predicts.

Expected example:

Your exact values may differ. The expected result is the same *type* of object and the same required status, not necessarily the same timestamps, row counts, colors, generated IDs, or screen dimensions.

What may look different:

Menu wording can vary by product release or account tier. Use the official-source register and look for the described object rather than guessing from an old screenshot.

How to verify success:

Reopen or refresh the relevant panel, locate the named object, and inspect the property or output that proves it exists and is in the intended location.

Do not continue unless:

You can point to the visible result and explain what it proves. Mark the action VERIFIED BY USER only after that check.

Common mistake:

Combining several clicks or decisions, choosing a similarly named object, or continuing because no error dialog appeared.

Exact recovery:

Stop at the current screen. Save a screenshot of the error if useful, hide sensitive values, and compare the selected location with the starting condition. Use Back or Cancel rather than Delete or Overwrite. Correct one mismatch and repeat only this action.

What you just accomplished:

You completed one observable piece of the Northstar Retail platform and established a checkpoint that can be audited later.

How this connects to the project:

The resulting object, decision, or evidence becomes an input to the next stage in the source-to-consumption chain.

[Back to the Phase 9 lesson index](#)

Teaching code section

```
source_path = "/Volumes/<catalog>/landing/northstar/<batch_id>/sqlserver/product_categories.csv"
target_table = f"{catalog}.bronze.erp_product_categories"
raw_df = spark.read.option("header", "true").csv(source_path)
bronze_df = (raw_df
    .withColumn("_batch_id", F.lit(batch_id))
    .withColumn("_source_file", F.input_file_name())
    .withColumn("_ingested_at", F.current_timestamp()))
(bronze_df.write.format("delta")
    .mode("append")
    .saveAsTable(target_table))
```

Line-by-line explanation

- **Line 1:** `source_path = "/Volumes/<catalog>/landing/northstar/<batch_id>/sqlserver/product_categories.csv"` — `source_path` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `=` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `"/Volumes/<catalog>/landing/northstar/<batch_id>/sqlserver/product_categories.csv"` is a path, relative location, branch-style name, or file argument; verify every character before running it
- **Line 2:** `target_table = f"{catalog}.bronze.erp_product_categories"` — `target_table` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `=` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `f` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `"{catalog}.bronze.erp_product_categories"` is a quoted literal; the quotation marks preserve spaces or mark text
- **Line 3:** `raw_df = spark.read.option("header", "true").csv(source_path)` — `raw_df` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `=` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `spark.read.option` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `(` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `"header"` is a quoted literal; the quotation marks preserve spaces or mark text; `,` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `"true"` is a quoted literal; the quotation marks preserve spaces or mark text; `)` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `csv` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `(` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `source_path` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `)` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation
- **Line 4:** `bronze_df = (raw_df — bronze_df is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; = is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; (is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; raw_df is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation`
- **Line 5:** `.withColumn("_batch_id", F.lit(batch_id))` — `.` is a path, relative location, branch-style name, or file argument; verify every character before running it; `withColumn` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `(` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `"_batch_id"` is a quoted literal; the quotation marks preserve spaces or mark text; `,` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `F.lit` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `(` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `batch_id` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `)` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation

Manifest reconciliation

1. Read the expected count and checksum for `product_categories` from the uploaded manifest.
2. Count rows in `bronze.erp_product_categories` where `_batch_id` equals the current batch.
3. Confirm every row has a source file and ingestion timestamp.
4. Compare the distinct source-file list with the manifest path.
5. Record the actual result: `[ENTER VERIFIED RESULT]`.

Quarantine behavior

Bronze preserves parseable raw rows. A completely unreadable file, malformed JSON line, missing required header, or manifest mismatch should fail or enter a technical quarantine according to the notebook contract. Business-invalid values remain available for Silver rules.

Common error and exact recovery

Representative error: `PATH_NOT_FOUND`, `TABLE_OR_VIEW_NOT_FOUND`, permission denied, or a schema mismatch.

Meaning: The input path, catalog/schema, permission, or assumed format does not match the uploaded batch.

Do not do: Do not create a new empty file at the missing path and do not change the batch ID until the mismatch disappears.

First diagnostic: List the volume directory and print the computed path.

Safest fix: Correct the upload location or parameter, then rerun only this entity cell.

Verification: The exact batch path is visible and counts reconcile.

Interview-ready explanation

"I created `bronze.erp_product_categories` as an auditable raw Delta table. I attached batch and file lineage, reconciled against a manifest, and tested same-batch behavior before allowing Silver to read it."

Bronze object 2 — `bronze.erp_suppliers`

Input: `suppliers.csv` or the equivalent entity extract in the uploaded Track A batch.

Target: Delta table `bronze.erp_suppliers`.

Responsibility: Preserve raw source columns while adding ingestion metadata; Bronze is not the place for business cleaning.

Grain: One Bronze row per input record for `suppliers` in one batch.

Required metadata: `_batch_id`, `_source_file`, `_ingested_at`, and source/system identifiers used by the project audit pattern.

Schema rule: Capture or declare the source shape deliberately. Unexpected columns/types must be visible, not silently discarded.

Rerun rule: Test the same batch twice. The implementation must either reject duplicate batch ingestion or prove a controlled idempotent strategy; unbounded append is not acceptable evidence.

Action 9.4.B2 — Ingest suppliers into `bronze.erp_suppliers`

Application:

Databricks workspace in a web browser

Window or panel:

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

Starting condition:

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Ingest suppliers into `bronze.erp_suppliers`. This is one bounded construction or inspection task.

Why this action comes now:

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

Exact physical actions:

1. CLICK: Open `databricks/notebooks/01_bronze_sqlserver.py` in the Databricks workspace or Git folder.
2. LOOK FOR: Confirm the notebook language is Python and the expected compute is attached or serverless is available.
3. LOOK FOR: Confirm the widget/parameter `batch_id` equals the uploaded batch folder exactly.
4. CLICK: Add or locate the entity-specific ingestion cell for `suppliers`.
5. TYPE THIS: Construct the entity path and target table from parameters; do not hard-code another user's catalog.
6. PRESS: Run the inspection cell first and display the raw schema and sample rows.
7. PRESS: Run the write cell only after the manifest entry and schema are understood.
8. LOOK FOR: A completed cell, a Delta target in Catalog Explorer, and the current batch metadata columns.
9. PRESS: Run the independent source-versus-Bronze count query.
10. DO NOT CONTINUE UNTIL: Row counts and batch ID match and a rerun test has a documented result.

Command or code:

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

Where to enter it:

Databricks workspace in a web browser. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

What each part means:

1. CLICK: Open `databricks/notebooks/01_bronze_sqlserver.py` in the Databricks workspace or Git folder.
2. LOOK FOR: Confirm the notebook language is Python and the expected compute is attached or serverless is available.
3. LOOK FOR: Confirm the widget/parameter `batch_id` equals the uploaded batch folder exactly.
4. CLICK: Add or locate the entity-specific ingestion cell for `suppliers`.
5. TYPE THIS: Construct the entity path and target table from parameters; do not hard-code another user's catalog.
6. PRESS: Run the inspection cell first and display the raw schema and sample rows.
7. PRESS: Run the write cell only after the manifest entry and schema are understood.
8. LOOK FOR: A completed cell, a Delta target in Catalog Explorer, and the current batch metadata columns.
9. PRESS: Run the independent source-versus-Bronze count query.
10. DO NOT CONTINUE UNTIL: Row counts and batch ID match and a rerun test has a documented result.

What should happen:

A visible file, folder, branch, connection, table, notebook, task, relationship, measure, visual, or verification result should appear exactly where the action predicts.

Expected example:

Your exact values may differ. The expected result is the same *type* of object and the same required status, not necessarily the same timestamps, row counts, colors, generated IDs, or screen dimensions.

What may look different:

Menu wording can vary by product release or account tier. Use the official-source register and look for the described object rather than guessing from an old screenshot.

How to verify success:

Reopen or refresh the relevant panel, locate the named object, and inspect the property or output that proves it exists and is in the intended location.

Do not continue unless:

You can point to the visible result and explain what it proves. Mark the action VERIFIED BY USER only after that check.

Common mistake:

Combining several clicks or decisions, choosing a similarly named object, or continuing because no error dialog appeared.

Exact recovery:

Stop at the current screen. Save a screenshot of the error if useful, hide sensitive values, and compare the selected location with the starting condition. Use Back or Cancel rather than Delete or Overwrite. Correct one mismatch and repeat only this action.

What you just accomplished:

You completed one observable piece of the Northstar Retail platform and established a checkpoint that can be audited later.

How this connects to the project:

The resulting object, decision, or evidence becomes an input to the next stage in the source-to-consumption chain.

Manifest reconciliation

1. Read the expected count and checksum for products from the uploaded manifest.
2. Count rows in `bronze.erp_products` where `_batch_id` equals the current batch.
3. Confirm every row has a source file and ingestion timestamp.
4. Compare the distinct source-file list with the manifest path.
5. Record the actual result: `[ENTER VERIFIED RESULT]`.

Quarantine behavior

Bronze preserves parseable raw rows. A completely unreadable file, malformed JSON line, missing required header, or manifest mismatch should fail or enter a technical quarantine according to the notebook contract. Business-invalid values remain available for Silver rules.

Common error and exact recovery

Representative error: `PATH_NOT_FOUND`, `TABLE_OR_VIEW_NOT_FOUND`, permission denied, or a schema mismatch.

Meaning: The input path, catalog/schema, permission, or assumed format does not match the uploaded batch.

Do not do: Do not create a new empty file at the missing path and do not change the batch ID until the mismatch disappears.

First diagnostic: List the volume directory and print the computed path.

Safest fix: Correct the upload location or parameter, then rerun only this entity cell.

Verification: The exact batch path is visible and counts reconcile.

Interview-ready explanation

"I created `bronze.erp_products` as an auditable raw Delta table. I attached batch and file lineage, reconciled against a manifest, and tested same-batch behavior before allowing Silver to read it."

Bronze object 4 — `bronze.erp_stores`

Input: `stores.csv` or the equivalent entity extract in the uploaded Track A batch.

Target: Delta table `bronze.erp_stores`.

Responsibility: Preserve raw source columns while adding ingestion metadata; Bronze is not the place for business cleaning.

Grain: One Bronze row per input record for stores in one batch.

Required metadata: `_batch_id`, `_source_file`, `_ingested_at`, and source/system identifiers used by the project audit pattern.

Schema rule: Capture or declare the source shape deliberately. Unexpected columns/types must be visible, not silently discarded.

Rerun rule: Test the same batch twice. The implementation must either reject duplicate batch ingestion or prove a controlled idempotent strategy; unbounded append is not acceptable evidence.

Action 9.4.B4 — Ingest stores into `bronze.erp_stores`

Application:

Databricks workspace in a web browser

Window or panel:

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

Starting condition:

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Ingest stores into `bronze.erp_stores`. This is one bounded construction or inspection task.

Why this action comes now:

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

Exact physical actions:

1. CLICK: Open `databricks/notebooks/01_bronze_sqlserver.py` in the Databricks workspace or Git folder.
2. LOOK FOR: Confirm the notebook language is Python and the expected compute is attached or serverless is available.
3. LOOK FOR: Confirm the widget/parameter `batch_id` equals the uploaded batch folder exactly.
4. CLICK: Add or locate the entity-specific ingestion cell for stores.
5. TYPE THIS: Construct the entity path and target table from parameters; do not hard-code another user's catalog.
6. PRESS: Run the inspection cell first and display the raw schema and sample rows.
7. PRESS: Run the write cell only after the manifest entry and schema are understood.
8. LOOK FOR: A completed cell, a Delta target in Catalog Explorer, and the current batch metadata columns.
9. PRESS: Run the independent source-versus-Bronze count query.
10. DO NOT CONTINUE UNTIL: Row counts and batch ID match and a rerun test has a documented result.

Command or code:

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

Where to enter it:

Databricks workspace in a web browser. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

What each part means:

1. CLICK: Open `databricks/notebooks/01_bronze_sqlserver.py` in the Databricks workspace or Git folder.
2. LOOK FOR: Confirm the notebook language is Python and the expected compute is attached or serverless is available.
3. LOOK FOR: Confirm the widget/parameter `batch_id` equals the uploaded batch folder exactly.
4. CLICK: Add or locate the entity-specific ingestion cell for stores.
5. TYPE THIS: Construct the entity path and target table from parameters; do not hard-code another user's catalog.
6. PRESS: Run the inspection cell first and display the raw schema and sample rows.
7. PRESS: Run the write cell only after the manifest entry and schema are understood.
8. LOOK FOR: A completed cell, a Delta target in Catalog Explorer, and the current batch metadata columns.
9. PRESS: Run the independent source-versus-Bronze count query.
10. DO NOT CONTINUE UNTIL: Row counts and batch ID match and a rerun test has a documented result.

What should happen:

A visible file, folder, branch, connection, table, notebook, task, relationship, measure, visual, or verification result should appear exactly where the action predicts.

Expected example:

Your exact values may differ. The expected result is the same *type* of object and the same required status, not necessarily the same timestamps, row counts, colors, generated IDs, or screen dimensions.

What may look different:

Menu wording can vary by product release or account tier. Use the official-source register and look for the described object rather than guessing from an old screenshot.

How to verify success:

Reopen or refresh the relevant panel, locate the named object, and inspect the property or output that proves it exists and is in the intended location.

Do not continue unless:

You can point to the visible result and explain what it proves. Mark the action VERIFIED BY USER only after that check.

Common mistake:

Combining several clicks or decisions, choosing a similarly named object, or continuing because no error dialog appeared.

Exact recovery:

Stop at the current screen. Save a screenshot of the error if useful, hide sensitive values, and compare the selected location with the starting condition. Use Back or Cancel rather than Delete or Overwrite. Correct one mismatch and repeat only this action.

What you just accomplished:

You completed one observable piece of the Northstar Retail platform and established a checkpoint that can be audited later.

How this connects to the project:

The resulting object, decision, or evidence becomes an input to the next stage in the source-to-consumption chain.

Manifest reconciliation

1. Read the expected count and checksum for stores from the uploaded manifest.
2. Count rows in `bronze.erp_stores` where `_batch_id` equals the current batch.
3. Confirm every row has a source file and ingestion timestamp.
4. Compare the distinct source-file list with the manifest path.
5. Record the actual result: [ENTER VERIFIED RESULT].

Quarantine behavior

Bronze preserves parseable raw rows. A completely unreadable file, malformed JSON line, missing required header, or manifest mismatch should fail or enter a technical quarantine according to the notebook contract. Business-invalid values remain available for Silver rules.

Common error and exact recovery

Representative error: `PATH_NOT_FOUND`, `TABLE_OR_VIEW_NOT_FOUND`, permission denied, or a schema mismatch.

Meaning: The input path, catalog/schema, permission, or assumed format does not match the uploaded batch.

Do not do: Do not create a new empty file at the missing path and do not change the batch ID until the mismatch disappears.

First diagnostic: List the volume directory and print the computed path.

Safest fix: Correct the upload location or parameter, then rerun only this entity cell.

Verification: The exact batch path is visible and counts reconcile.

Interview-ready explanation

"I created `bronze.erp_stores` as an auditable raw Delta table. I attached batch and file lineage, reconciled against a manifest, and tested same-batch behavior before allowing Silver to read it."

Bronze object 5 — `bronze.erp_employees`

Input: `employees.csv` or the equivalent entity extract in the uploaded Track A batch.

Target: Delta table `bronze.erp_employees`.

Responsibility: Preserve raw source columns while adding ingestion metadata; Bronze is not the place for business cleaning.

Grain: One Bronze row per input record for `employees` in one batch.

Required metadata: `_batch_id`, `_source_file`, `_ingested_at`, and source/system identifiers used by the project audit pattern.

Schema rule: Capture or declare the source shape deliberately. Unexpected columns/types must be visible, not silently discarded.

Rerun rule: Test the same batch twice. The implementation must either reject duplicate batch ingestion or prove a controlled idempotent strategy; unbounded append is not acceptable evidence.

Action 9.4.B5 — Ingest employees into `bronze.erp_employees`

Application:

Databricks workspace in a web browser

Window or panel:

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

Starting condition:

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Ingest employees into `bronze.erp_employees`. This is one bounded construction or inspection task.

Why this action comes now:

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

Manifest reconciliation

1. Read the expected count and checksum for employees from the uploaded manifest.
2. Count rows in `bronze.erp_employees` where `_batch_id` equals the current batch.
3. Confirm every row has a source file and ingestion timestamp.
4. Compare the distinct source-file list with the manifest path.
5. Record the actual result: `[ENTER VERIFIED RESULT]`.

Quarantine behavior

Bronze preserves parseable raw rows. A completely unreadable file, malformed JSON line, missing required header, or manifest mismatch should fail or enter a technical quarantine according to the notebook contract. Business-invalid values remain available for Silver rules.

Common error and exact recovery

Representative error: `PATH_NOT_FOUND`, `TABLE_OR_VIEW_NOT_FOUND`, permission denied, or a schema mismatch.

Meaning: The input path, catalog/schema, permission, or assumed format does not match the uploaded batch.

Do not do: Do not create a new empty file at the missing path and do not change the batch ID until the mismatch disappears.

First diagnostic: List the volume directory and print the computed path.

Safest fix: Correct the upload location or parameter, then rerun only this entity cell.

Verification: The exact batch path is visible and counts reconcile.

Interview-ready explanation

"I created `bronze.erp_employees` as an auditable raw Delta table. I attached batch and file lineage, reconciled against a manifest, and tested same-batch behavior before allowing Silver to read it."

Bronze object 6 — `bronze.erp_customers`

Input: `customers.csv` or the equivalent entity extract in the uploaded Track A batch.

Target: Delta table `bronze.erp_customers`.

Responsibility: Preserve raw source columns while adding ingestion metadata; Bronze is not the place for business cleaning.

Grain: One Bronze row per input record for customers in one batch.

Required metadata: `_batch_id`, `_source_file`, `_ingested_at`, and source/system identifiers used by the project audit pattern.

Schema rule: Capture or declare the source shape deliberately. Unexpected columns/types must be visible, not silently discarded.

Rerun rule: Test the same batch twice. The implementation must either reject duplicate batch ingestion or prove a controlled idempotent strategy; unbounded append is not acceptable evidence.

Action 9.4.B6 — Ingest customers into `bronze.erp_customers`

Application:

Databricks workspace in a web browser

Window or panel:

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

Starting condition:

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Ingest customers into `bronze.erp_customers`. This is one bounded construction or inspection task.

Why this action comes now:

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

Exact physical actions:

1. CLICK: Open `databricks/notebooks/01_bronze_sqlserver.py` in the Databricks workspace or Git folder.

2. LOOK FOR: Confirm the notebook language is Python and the expected compute is attached or serverless is available.
3. LOOK FOR: Confirm the widget/parameter `batch_id` equals the uploaded batch folder exactly.
4. CLICK: Add or locate the entity-specific ingestion cell for customers.
5. TYPE THIS: Construct the entity path and target table from parameters; do not hard-code another user's catalog.
6. PRESS: Run the inspection cell first and display the raw schema and sample rows.
7. PRESS: Run the write cell only after the manifest entry and schema are understood.
8. LOOK FOR: A completed cell, a Delta target in Catalog Explorer, and the current batch metadata columns.
9. PRESS: Run the independent source-versus-Bronze count query.
10. DO NOT CONTINUE UNTIL: Row counts and batch ID match and a rerun test has a documented result.

Command or code:

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

Where to enter it:

Databricks workspace in a web browser. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

What each part means:

1. CLICK: Open `databricks/notebooks/01_bronze_sqlserver.py` in the Databricks workspace or Git folder.
2. LOOK FOR: Confirm the notebook language is Python and the expected compute is attached or serverless is available.
3. LOOK FOR: Confirm the widget/parameter `batch_id` equals the uploaded batch folder exactly.
4. CLICK: Add or locate the entity-specific ingestion cell for customers.
5. TYPE THIS: Construct the entity path and target table from parameters; do not hard-code another user's catalog.
6. PRESS: Run the inspection cell first and display the raw schema and sample rows.
7. PRESS: Run the write cell only after the manifest entry and schema are understood.
8. LOOK FOR: A completed cell, a Delta target in Catalog Explorer, and the current batch metadata columns.
9. PRESS: Run the independent source-versus-Bronze count query.
10. DO NOT CONTINUE UNTIL: Row counts and batch ID match and a rerun test has a documented result.

What should happen:

A visible file, folder, branch, connection, table, notebook, task, relationship, measure, visual, or verification result should appear exactly where the action predicts.

Expected example:

Your exact values may differ. The expected result is the same *type* of object and the same required status, not necessarily the same timestamps, row counts, colors, generated IDs, or screen dimensions.

What may look different:

Menu wording can vary by product release or account tier. Use the official-source register and look for the described object rather than guessing from an old screenshot.

How to verify success:

Reopen or refresh the relevant panel, locate the named object, and inspect the property or output that proves it exists and is in the intended location.

Do not continue unless:

You can point to the visible result and explain what it proves. Mark the action VERIFIED BY USER only after that check.

Common mistake:

Combining several clicks or decisions, choosing a similarly named object, or continuing because no error dialog appeared.

Exact recovery:

Stop at the current screen. Save a screenshot of the error if useful, hide sensitive values, and compare the selected location with the starting condition. Use Back or Cancel rather than Delete or Overwrite. Correct one mismatch and repeat only this action.

What you just accomplished:

You completed one observable piece of the Northstar Retail platform and established a checkpoint that can be audited later.

How this connects to the project:

The resulting object, decision, or evidence becomes an input to the next stage in the source-to-consumption chain.

Manifest reconciliation

1. Read the expected count and checksum for customers from the uploaded manifest.
2. Count rows in `bronze.erp_customers` where `_batch_id` equals the current batch.
3. Confirm every row has a source file and ingestion timestamp.
4. Compare the distinct source-file list with the manifest path.
5. Record the actual result: [ENTER VERIFIED RESULT].

Quarantine behavior

Bronze preserves parseable raw rows. A completely unreadable file, malformed JSON line, missing required header, or manifest mismatch should fail or enter a technical quarantine according to the notebook contract. Business-invalid values remain available for Silver rules.

Common error and exact recovery

Representative error: `PATH_NOT_FOUND`, `TABLE_OR_VIEW_NOT_FOUND`, permission denied, or a schema mismatch.

Meaning: The input path, catalog/schema, permission, or assumed format does not match the uploaded batch.

Do not do: Do not create a new empty file at the missing path and do not change the batch ID until the mismatch disappears.

First diagnostic: List the volume directory and print the computed path.

Safest fix: Correct the upload location or parameter, then rerun only this entity cell.

Verification: The exact batch path is visible and counts reconcile.

Interview-ready explanation

"I created `bronze.erp_customers` as an auditable raw Delta table. I attached batch and file lineage, reconciled against a manifest, and tested same-batch behavior before allowing Silver to read it."

Bronze object 7 — `bronze.erp_addresses`

Input: `addresses.csv` or the equivalent entity extract in the uploaded Track A batch.

Target: Delta table `bronze.erp_addresses`.

Responsibility: Preserve raw source columns while adding ingestion metadata; Bronze is not the place for business cleaning.

Grain: One Bronze row per input record for addresses in one batch.

Required metadata: `_batch_id`, `_source_file`, `_ingested_at`, and source/system identifiers used by the project audit pattern.

Schema rule: Capture or declare the source shape deliberately. Unexpected columns/types must be visible, not silently discarded.

Rerun rule: Test the same batch twice. The implementation must either reject duplicate batch ingestion or prove a controlled idempotent strategy; unbounded append is not acceptable evidence.

Action 9.4.B7 — Ingest addresses into bronze.erp_addresses

Application:

Databricks workspace in a web browser

Window or panel:

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

Starting condition:

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Ingest addresses into bronze.erp_addresses. This is one bounded construction or inspection task.

Why this action comes now:

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

Exact physical actions:

1. CLICK: Open databricks/notebooks/01_bronze_sqlserver.py in the Databricks workspace or Git folder.
2. LOOK FOR: Confirm the notebook language is Python and the expected compute is attached or serverless is available.
3. LOOK FOR: Confirm the widget/parameter batch_id equals the uploaded batch folder exactly.
4. CLICK: Add or locate the entity-specific ingestion cell for addresses.
5. TYPE THIS: Construct the entity path and target table from parameters; do not hard-code another user's catalog.
6. PRESS: Run the inspection cell first and display the raw schema and sample rows.
7. PRESS: Run the write cell only after the manifest entry and schema are understood.
8. LOOK FOR: A completed cell, a Delta target in Catalog Explorer, and the current batch metadata columns.
9. PRESS: Run the independent source-versus-Bronze count query.
10. DO NOT CONTINUE UNTIL: Row counts and batch ID match and a rerun test has a documented result.

Command or code:

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

Where to enter it:

Databricks workspace in a web browser. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

What each part means:

1. CLICK: Open databricks/notebooks/01_bronze_sqlserver.py in the Databricks workspace or Git folder.
2. LOOK FOR: Confirm the notebook language is Python and the expected compute is attached or serverless is available.
3. LOOK FOR: Confirm the widget/parameter batch_id equals the uploaded batch folder exactly.
4. CLICK: Add or locate the entity-specific ingestion cell for addresses.
5. TYPE THIS: Construct the entity path and target table from parameters; do not hard-code another user's catalog.
6. PRESS: Run the inspection cell first and display the raw schema and sample rows.
7. PRESS: Run the write cell only after the manifest entry and schema are understood.
8. LOOK FOR: A completed cell, a Delta target in Catalog Explorer, and the current batch metadata columns.
9. PRESS: Run the independent source-versus-Bronze count query.
10. DO NOT CONTINUE UNTIL: Row counts and batch ID match and a rerun test has a documented result.

What should happen:

A visible file, folder, branch, connection, table, notebook, task, relationship, measure, visual, or verification result should appear exactly where the action predicts.

Interview-ready explanation

"I created bronze.erp_addresses as an auditable raw Delta table. I attached batch and file lineage, reconciled against a manifest, and tested same-batch behavior before allowing Silver to read it."

Bronze object 8 — bronze.erp_orders

Input: orders.csv or the equivalent entity extract in the uploaded Track A batch.

Target: Delta table bronze.erp_orders.

Responsibility: Preserve raw source columns while adding ingestion metadata; Bronze is not the place for business cleaning.

Grain: One Bronze row per input record for orders in one batch.

Required metadata: _batch_id, _source_file, _ingested_at, and source/system identifiers used by the project audit pattern.

Schema rule: Capture or declare the source shape deliberately. Unexpected columns/types must be visible, not silently discarded.

Rerun rule: Test the same batch twice. The implementation must either reject duplicate batch ingestion or prove a controlled idempotent strategy; unbounded append is not acceptable evidence.

Action 9.4.B8 — Ingest orders into bronze.erp_orders

Application:

Databricks workspace in a web browser

Window or panel:

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

Starting condition:

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Ingest orders into bronze.erp_orders. This is one bounded construction or inspection task.

Why this action comes now:

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

Exact physical actions:

1. CLICK: Open databricks/notebooks/01_bronze_sqlserver.py in the Databricks workspace or Git folder.
2. LOOK FOR: Confirm the notebook language is Python and the expected compute is attached or serverless is available.
3. LOOK FOR: Confirm the widget/parameter batch_id equals the uploaded batch folder exactly.
4. CLICK: Add or locate the entity-specific ingestion cell for orders.
5. TYPE THIS: Construct the entity path and target table from parameters; do not hard-code another user's catalog.
6. PRESS: Run the inspection cell first and display the raw schema and sample rows.
7. PRESS: Run the write cell only after the manifest entry and schema are understood.
8. LOOK FOR: A completed cell, a Delta target in Catalog Explorer, and the current batch metadata columns.

9. PRESS: Run the independent source-versus-Bronze count query.
10. DO NOT CONTINUE UNTIL: Row counts and batch ID match and a rerun test has a documented result.

Command or code:

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

Where to enter it:

Databricks workspace in a web browser. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

What each part means:

1. CLICK: Open `databricks/notebooks/01_bronze_sqlserver.py` in the Databricks workspace or Git folder.
2. LOOK FOR: Confirm the notebook language is Python and the expected compute is attached or serverless is available.
3. LOOK FOR: Confirm the widget/parameter `batch_id` equals the uploaded batch folder exactly.
4. CLICK: Add or locate the entity-specific ingestion cell for orders.
5. TYPE THIS: Construct the entity path and target table from parameters; do not hard-code another user's catalog.
6. PRESS: Run the inspection cell first and display the raw schema and sample rows.
7. PRESS: Run the write cell only after the manifest entry and schema are understood.
8. LOOK FOR: A completed cell, a Delta target in Catalog Explorer, and the current batch metadata columns.
9. PRESS: Run the independent source-versus-Bronze count query.
10. DO NOT CONTINUE UNTIL: Row counts and batch ID match and a rerun test has a documented result.

What should happen:

A visible file, folder, branch, connection, table, notebook, task, relationship, measure, visual, or verification result should appear exactly where the action predicts.

Expected example:

Your exact values may differ. The expected result is the same *type* of object and the same required status, not necessarily the same timestamps, row counts, colors, generated IDs, or screen dimensions.

What may look different:

Menu wording can vary by product release or account tier. Use the official-source register and look for the described object rather than guessing from an old screenshot.

How to verify success:

Reopen or refresh the relevant panel, locate the named object, and inspect the property or output that proves it exists and is in the intended location.

Do not continue unless:

You can point to the visible result and explain what it proves. Mark the action VERIFIED BY USER only after that check.

Common mistake:

Combining several clicks or decisions, choosing a similarly named object, or continuing because no error dialog appeared.

Exact recovery:

Stop at the current screen. Save a screenshot of the error if useful, hide sensitive values, and compare the selected location with the starting condition. Use Back or Cancel rather than Delete or Overwrite. Correct one mismatch and repeat only this action.

What you just accomplished:

You completed one observable piece of the Northstar Retail platform and established a checkpoint that can be audited later.

How this connects to the project:

The resulting object, decision, or evidence becomes an input to the next stage in the source-to-consumption chain.

Manifest reconciliation

1. Read the expected count and checksum for orders from the uploaded manifest.
2. Count rows in `bronze.erp_orders` where `_batch_id` equals the current batch.
3. Confirm every row has a source file and ingestion timestamp.
4. Compare the distinct source-file list with the manifest path.
5. Record the actual result: [ENTER VERIFIED RESULT].

Quarantine behavior

Bronze preserves parseable raw rows. A completely unreadable file, malformed JSON line, missing required header, or manifest mismatch should fail or enter a technical quarantine according to the notebook contract. Business-invalid values remain available for Silver rules.

Common error and exact recovery

Representative error: `PATH_NOT_FOUND`, `TABLE_OR_VIEW_NOT_FOUND`, permission denied, or a schema mismatch.

Meaning: The input path, catalog/schema, permission, or assumed format does not match the uploaded batch.

Do not do: Do not create a new empty file at the missing path and do not change the batch ID until the mismatch disappears.

First diagnostic: List the volume directory and print the computed path.

Safest fix: Correct the upload location or parameter, then rerun only this entity cell.

Verification: The exact batch path is visible and counts reconcile.

Interview-ready explanation

"I created `bronze.erp_orders` as an auditable raw Delta table. I attached batch and file lineage, reconciled against a manifest, and tested same-batch behavior before allowing Silver to read it."

Bronze object 9 — `bronze.erp_order_items`

Input: `order_items.csv` or the equivalent entity extract in the uploaded Track A batch.

Target: Delta table `bronze.erp_order_items`.

Responsibility: Preserve raw source columns while adding ingestion metadata; Bronze is not the place for business cleaning.

Grain: One Bronze row per input record for `order_items` in one batch.

Required metadata: `_batch_id`, `_source_file`, `_ingested_at`, and source/system identifiers used by the project audit pattern.

Schema rule: Capture or declare the source shape deliberately. Unexpected columns/types must be visible, not silently discarded.

Rerun rule: Test the same batch twice. The implementation must either reject duplicate batch ingestion or prove a controlled idempotent strategy; unbounded append is not acceptable evidence.

Action 9.4.B9 — Ingest `order_items` into `bronze.erp_order_items`

Application:

Databricks workspace in a web browser

Window or panel:

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

Starting condition:

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Ingest `order_items` into `bronze.erp_order_items`. This is one bounded construction or inspection task.

Why this action comes now:

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

Exact physical actions:

1. CLICK: Open `databricks/notebooks/01_bronze_sqlserver.py` in the Databricks workspace or Git folder.
2. LOOK FOR: Confirm the notebook language is Python and the expected compute is attached or serverless is available.
3. LOOK FOR: Confirm the widget/parameter `batch_id` equals the uploaded batch folder exactly.
4. CLICK: Add or locate the entity-specific ingestion cell for `order_items`.
5. TYPE THIS: Construct the entity path and target table from parameters; do not hard-code another user's catalog.
6. PRESS: Run the inspection cell first and display the raw schema and sample rows.
7. PRESS: Run the write cell only after the manifest entry and schema are understood.
8. LOOK FOR: A completed cell, a Delta target in Catalog Explorer, and the current batch metadata columns.
9. PRESS: Run the independent source-versus-Bronze count query.
10. DO NOT CONTINUE UNTIL: Row counts and batch ID match and a rerun test has a documented result.

Command or code:

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

Where to enter it:

Databricks workspace in a web browser. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

What each part means:

1. CLICK: Open `databricks/notebooks/01_bronze_sqlserver.py` in the Databricks workspace or Git folder.
2. LOOK FOR: Confirm the notebook language is Python and the expected compute is attached or serverless is available.
3. LOOK FOR: Confirm the widget/parameter `batch_id` equals the uploaded batch folder exactly.
4. CLICK: Add or locate the entity-specific ingestion cell for `order_items`.
5. TYPE THIS: Construct the entity path and target table from parameters; do not hard-code another user's catalog.
6. PRESS: Run the inspection cell first and display the raw schema and sample rows.
7. PRESS: Run the write cell only after the manifest entry and schema are understood.
8. LOOK FOR: A completed cell, a Delta target in Catalog Explorer, and the current batch metadata columns.
9. PRESS: Run the independent source-versus-Bronze count query.
10. DO NOT CONTINUE UNTIL: Row counts and batch ID match and a rerun test has a documented result.

What should happen:

A visible file, folder, branch, connection, table, notebook, task, relationship, measure, visual, or verification result should appear exactly where the action predicts.

Expected example:

Your exact values may differ. The expected result is the same *type* of object and the same required status, not necessarily the same timestamps, row counts, colors, generated IDs, or screen dimensions.

What may look different:

Menu wording can vary by product release or account tier. Use the official-source register and look for the described object rather than guessing from an old screenshot.

How to verify success:

Reopen or refresh the relevant panel, locate the named object, and inspect the property or output that proves it exists and is in the intended location.

Do not continue unless:

You can point to the visible result and explain what it proves. Mark the action VERIFIED BY USER only after that check.

Common mistake:

Combining several clicks or decisions, choosing a similarly named object, or continuing because no error dialog appeared.

Exact recovery:

Stop at the current screen. Save a screenshot of the error if useful, hide sensitive values, and compare the selected location with the starting condition. Use Back or Cancel rather than Delete or Overwrite. Correct one mismatch and repeat only this action.

What you just accomplished:

You completed one observable piece of the Northstar Retail platform and established a checkpoint that can be audited later.

How this connects to the project:

The resulting object, decision, or evidence becomes an input to the next stage in the source-to-consumption chain.

Manifest reconciliation

1. Read the expected count and checksum for order_items from the uploaded manifest.
2. Count rows in bronze.erp_order_items where _batch_id equals the current batch.
3. Confirm every row has a source file and ingestion timestamp.
4. Compare the distinct source-file list with the manifest path.
5. Record the actual result: [ENTER VERIFIED RESULT].

Quarantine behavior

Bronze preserves parseable raw rows. A completely unreadable file, malformed JSON line, missing required header, or manifest mismatch should fail or enter a technical quarantine according to the notebook contract. Business-invalid values remain available for Silver rules.

Common error and exact recovery

Representative error: PATH_NOT_FOUND, TABLE_OR_VIEW_NOT_FOUND, permission denied, or a schema mismatch.

Meaning: The input path, catalog/schema, permission, or assumed format does not match the uploaded batch.

Do not do: Do not create a new empty file at the missing path and do not change the batch ID until the mismatch disappears.

First diagnostic: List the volume directory and print the computed path.

Safest fix: Correct the upload location or parameter, then rerun only this entity cell.

Verification: The exact batch path is visible and counts reconcile.

Interview-ready explanation

"I created `bronze.erp_order_items` as an auditable raw Delta table. I attached batch and file lineage, reconciled against a manifest, and tested same-batch behavior before allowing Silver to read it."

Bronze object 10 — `bronze.erp_payments`

Input: `payments.csv` or the equivalent entity extract in the uploaded Track A batch.

Target: Delta table `bronze.erp_payments`.

Responsibility: Preserve raw source columns while adding ingestion metadata; Bronze is not the place for business cleaning.

Grain: One Bronze row per input record for payments in one batch.

Required metadata: `_batch_id`, `_source_file`, `_ingested_at`, and source/system identifiers used by the project audit pattern.

Schema rule: Capture or declare the source shape deliberately. Unexpected columns/types must be visible, not silently discarded.

Rerun rule: Test the same batch twice. The implementation must either reject duplicate batch ingestion or prove a controlled idempotent strategy; unbounded append is not acceptable evidence.

Action 9.4.B10 — Ingest payments into `bronze.erp_payments`

Application:

Databricks workspace in a web browser

Window or panel:

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

Starting condition:

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Ingest payments into `bronze.erp_payments`. This is one bounded construction or inspection task.

Why this action comes now:

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

Exact physical actions:

1. CLICK: Open `databricks/notebooks/01_bronze_sqlserver.py` in the Databricks workspace or Git folder.
2. LOOK FOR: Confirm the notebook language is Python and the expected compute is attached or serverless is available.
3. LOOK FOR: Confirm the widget/parameter `batch_id` equals the uploaded batch folder exactly.
4. CLICK: Add or locate the entity-specific ingestion cell for payments.
5. TYPE THIS: Construct the entity path and target table from parameters; do not hard-code another user's catalog.
6. PRESS: Run the inspection cell first and display the raw schema and sample rows.
7. PRESS: Run the write cell only after the manifest entry and schema are understood.
8. LOOK FOR: A completed cell, a Delta target in Catalog Explorer, and the current batch metadata columns.
9. PRESS: Run the independent source-versus-Bronze count query.
10. DO NOT CONTINUE UNTIL: Row counts and batch ID match and a rerun test has a documented result.

Command or code:

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

Where to enter it:

Databricks workspace in a web browser. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

What each part means:

1. CLICK: Open databricks/notebooks/01_bronze_sqlserver.py in the Databricks workspace or Git folder.

Manifest reconciliation

1. Read the expected count and checksum for payments from the uploaded manifest.
2. Count rows in `bronze.erp_payments` where `_batch_id` equals the current batch.
3. Confirm every row has a source file and ingestion timestamp.
4. Compare the distinct source-file list with the manifest path.
5. Record the actual result: `[ENTER VERIFIED RESULT]`.

Quarantine behavior

Bronze preserves parseable raw rows. A completely unreadable file, malformed JSON line, missing required header, or manifest mismatch should fail or enter a technical quarantine according to the notebook contract. Business-invalid values remain available for Silver rules.

Common error and exact recovery

Representative error: `PATH_NOT_FOUND`, `TABLE_OR_VIEW_NOT_FOUND`, permission denied, or a schema mismatch.

Meaning: The input path, catalog/schema, permission, or assumed format does not match the uploaded batch.

Do not do: Do not create a new empty file at the missing path and do not change the batch ID until the mismatch disappears.

First diagnostic: List the volume directory and print the computed path.

Safest fix: Correct the upload location or parameter, then rerun only this entity cell.

Verification: The exact batch path is visible and counts reconcile.

Interview-ready explanation

"I created `bronze.erp_payments` as an auditable raw Delta table. I attached batch and file lineage, reconciled against a manifest, and tested same-batch behavior before allowing Silver to read it."

Bronze object 11 — `bronze.erp_shipments`

Input: `shipments.csv` or the equivalent entity extract in the uploaded Track A batch.

Target: Delta table `bronze.erp_shipments`.

Responsibility: Preserve raw source columns while adding ingestion metadata; Bronze is not the place for business cleaning.

Grain: One Bronze row per input record for `shipments` in one batch.

Required metadata: `_batch_id`, `_source_file`, `_ingested_at`, and source/system identifiers used by the project audit pattern.

Schema rule: Capture or declare the source shape deliberately. Unexpected columns/types must be visible, not silently discarded.

Rerun rule: Test the same batch twice. The implementation must either reject duplicate batch ingestion or prove a controlled idempotent strategy; unbounded append is not acceptable evidence.

Action 9.4.B11 — Ingest shipments into `bronze.erp_shipments`

Application:

Databricks workspace in a web browser

Window or panel:

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

Starting condition:

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Ingest shipments into bronze.erp_shipments. This is one bounded construction or inspection task.

Why this action comes now:

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

Exact physical actions:

1. CLICK: Open databricks/notebooks/01_bronze_sqlserver.py in the Databricks workspace or Git folder.
2. LOOK FOR: Confirm the notebook language is Python and the expected compute is attached or serverless is available.
3. LOOK FOR: Confirm the widget/parameter batch_id equals the uploaded batch folder exactly.
4. CLICK: Add or locate the entity-specific ingestion cell for shipments.
5. TYPE THIS: Construct the entity path and target table from parameters; do not hard-code another user's catalog.
6. PRESS: Run the inspection cell first and display the raw schema and sample rows.
7. PRESS: Run the write cell only after the manifest entry and schema are understood.
8. LOOK FOR: A completed cell, a Delta target in Catalog Explorer, and the current batch metadata columns.
9. PRESS: Run the independent source-versus-Bronze count query.
10. DO NOT CONTINUE UNTIL: Row counts and batch ID match and a rerun test has a documented result.

Command or code:

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

Where to enter it:

Databricks workspace in a web browser. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

What each part means:

1. CLICK: Open databricks/notebooks/01_bronze_sqlserver.py in the Databricks workspace or Git folder.
2. LOOK FOR: Confirm the notebook language is Python and the expected compute is attached or serverless is available.
3. LOOK FOR: Confirm the widget/parameter batch_id equals the uploaded batch folder exactly.
4. CLICK: Add or locate the entity-specific ingestion cell for shipments.
5. TYPE THIS: Construct the entity path and target table from parameters; do not hard-code another user's catalog.
6. PRESS: Run the inspection cell first and display the raw schema and sample rows.
7. PRESS: Run the write cell only after the manifest entry and schema are understood.
8. LOOK FOR: A completed cell, a Delta target in Catalog Explorer, and the current batch metadata columns.
9. PRESS: Run the independent source-versus-Bronze count query.
10. DO NOT CONTINUE UNTIL: Row counts and batch ID match and a rerun test has a documented result.

What should happen:

A visible file, folder, branch, connection, table, notebook, task, relationship, measure, visual, or verification result should appear exactly where the action predicts.

Expected example:

Your exact values may differ. The expected result is the same *type* of object and the same required status, not necessarily the same timestamps, row counts, colors, generated IDs, or screen dimensions.

What may look different:

Menu wording can vary by product release or account tier. Use the official-source register and look for the described object rather than guessing from an old screenshot.

How to verify success:

Reopen or refresh the relevant panel, locate the named object, and inspect the property or output that proves it exists and is in the intended location.

Do not continue unless:

You can point to the visible result and explain what it proves. Mark the action VERIFIED BY USER only after that check.

Common mistake:

Combining several clicks or decisions, choosing a similarly named object, or continuing because no error dialog appeared.

Exact recovery:

Stop at the current screen. Save a screenshot of the error if useful, hide sensitive values, and compare the selected location with the starting condition. Use Back or Cancel rather than Delete or Overwrite. Correct one mismatch and repeat only this action.

What you just accomplished:

You completed one observable piece of the Northstar Retail platform and established a checkpoint that can be audited later.

How this connects to the project:

The resulting object, decision, or evidence becomes an input to the next stage in the source-to-consumption chain.

Manifest reconciliation

1. Read the expected count and checksum for shipments from the uploaded manifest.
2. Count rows in `bronze.erp_shipments` where `_batch_id` equals the current batch.
3. Confirm every row has a source file and ingestion timestamp.
4. Compare the distinct source-file list with the manifest path.
5. Record the actual result: [ENTER VERIFIED RESULT].

Quarantine behavior

Bronze preserves parseable raw rows. A completely unreadable file, malformed JSON line, missing required header, or manifest mismatch should fail or enter a technical quarantine according to the notebook contract. Business-invalid values remain available for Silver rules.

Common error and exact recovery

Representative error: `PATH_NOT_FOUND`, `TABLE_OR_VIEW_NOT_FOUND`, permission denied, or a schema mismatch.

Meaning: The input path, catalog/schema, permission, or assumed format does not match the uploaded batch.

Do not do: Do not create a new empty file at the missing path and do not change the batch ID until the mismatch disappears.

First diagnostic: List the volume directory and print the computed path.

Safest fix: Correct the upload location or parameter, then rerun only this entity cell.

Verification: The exact batch path is visible and counts reconcile.

Interview-ready explanation

"I created `bronze.erp_shipments` as an auditable raw Delta table. I attached batch and file lineage, reconciled against a manifest, and tested same-batch behavior before allowing Silver to read it."

Bronze object 12 — `bronze.erp_inventory_transactions`

Input: `inventory_transactions.csv` or the equivalent entity extract in the uploaded Track A batch.

Target: Delta table `bronze.erp_inventory_transactions`.

Responsibility: Preserve raw source columns while adding ingestion metadata; Bronze is not the place for business cleaning.

Grain: One Bronze row per input record for `inventory_transactions` in one batch.

Required metadata: `_batch_id`, `_source_file`, `_ingested_at`, and source/system identifiers used by the project audit pattern.

Schema rule: Capture or declare the source shape deliberately. Unexpected columns/types must be visible, not silently discarded.

Rerun rule: Test the same batch twice. The implementation must either reject duplicate batch ingestion or prove a controlled idempotent strategy; unbounded append is not acceptable evidence.

Action 9.4.B12 — Ingest `inventory_transactions` into `bronze.erp_inventory_transactions`

Application:

Databricks workspace in a web browser

Window or panel:

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

Starting condition:

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Ingest `inventory_transactions` into `bronze.erp_inventory_transactions`. This is one bounded construction or inspection task.

Why this action comes now:

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

Exact physical actions:

1. CLICK: Open `databricks/notebooks/01_bronze_sqlserver.py` in the Databricks workspace or Git folder.
2. LOOK FOR: Confirm the notebook language is Python and the expected compute is attached or serverless is available.
3. LOOK FOR: Confirm the widget/parameter `batch_id` equals the uploaded batch folder exactly.
4. CLICK: Add or locate the entity-specific ingestion cell for `inventory_transactions`.
5. TYPE THIS: Construct the entity path and target table from parameters; do not hard-code another user's catalog.
6. PRESS: Run the inspection cell first and display the raw schema and sample rows.
7. PRESS: Run the write cell only after the manifest entry and schema are understood.
8. LOOK FOR: A completed cell, a Delta target in Catalog Explorer, and the current batch metadata columns.
9. PRESS: Run the independent source-versus-Bronze count query.
10. DO NOT CONTINUE UNTIL: Row counts and batch ID match and a rerun test has a documented result.

Command or code:

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

Where to enter it:

Databricks workspace in a web browser. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

What each part means:

1. CLICK: Open `databricks/notebooks/01_bronze_sqlserver.py` in the Databricks workspace or Git folder.

er, or literal whose project-specific role is described in the surrounding explanation;)) is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation

Manifest reconciliation

1. Read the expected count and checksum for `inventory_transactions` from the uploaded manifest.
2. Count rows in `bronze.erp_inventory_transactions` where `_batch_id` equals the current batch.
3. Confirm every row has a source file and ingestion timestamp.
4. Compare the distinct source-file list with the manifest path.
5. Record the actual result: `[ENTER VERIFIED RESULT]`.

Quarantine behavior

Bronze preserves parseable raw rows. A completely unreadable file, malformed JSON line, missing required header, or manifest mismatch should fail or enter a technical quarantine according to the notebook contract. Business-invalid values remain available for Silver rules.

Common error and exact recovery

Representative error: `PATH_NOT_FOUND`, `TABLE_OR_VIEW_NOT_FOUND`, permission denied, or a schema mismatch.

Meaning: The input path, catalog/schema, permission, or assumed format does not match the uploaded batch.

Do not do: Do not create a new empty file at the missing path and do not change the batch ID until the mismatch disappears.

First diagnostic: List the volume directory and print the computed path.

Safest fix: Correct the upload location or parameter, then rerun only this entity cell.

Verification: The exact batch path is visible and counts reconcile.

Interview-ready explanation

"I created `bronze.erp_inventory_transactions` as an auditable raw Delta table. I attached batch and file lineage, reconciled against a manifest, and tested same-batch behavior before allowing Silver to read it."

Bronze object 13 — `bronze.erp_inventory_snapshots`

Input: `inventory_snapshots.csv` or the equivalent entity extract in the uploaded Track A batch.

Target: Delta table `bronze.erp_inventory_snapshots`.

Responsibility: Preserve raw source columns while adding ingestion metadata; Bronze is not the place for business cleaning.

Grain: One Bronze row per input record for `inventory_snapshots` in one batch.

Required metadata: `_batch_id`, `_source_file`, `_ingested_at`, and source/system identifiers used by the project audit pattern.

Schema rule: Capture or declare the source shape deliberately. Unexpected columns/types must be visible, not silently discarded.

Rerun rule: Test the same batch twice. The implementation must either reject duplicate batch ingestion or prove a controlled idempotent strategy; unbounded append is not acceptable evidence.

Action 9.4.B13 — Ingest `inventory_snapshots` into `bronze.erp_inventory_snapshots`

Application:

Databricks workspace in a web browser

Window or panel:

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

Starting condition:

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Ingest `inventory_snapshots` into `bronze.erp_inventory_snapshots`. This is one bounded construction or inspection task.

Why this action comes now:

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

Exact physical actions:

1. CLICK: Open `databricks/notebooks/01_bronze_sqlserver.py` in the Databricks workspace or Git folder.
2. LOOK FOR: Confirm the notebook language is Python and the expected compute is attached or serverless is available.
3. LOOK FOR: Confirm the widget/parameter `batch_id` equals the uploaded batch folder exactly.
4. CLICK: Add or locate the entity-specific ingestion cell for `inventory_snapshots`.
5. TYPE THIS: Construct the entity path and target table from parameters; do not hard-code another user's catalog.
6. PRESS: Run the inspection cell first and display the raw schema and sample rows.
7. PRESS: Run the write cell only after the manifest entry and schema are understood.
8. LOOK FOR: A completed cell, a Delta target in Catalog Explorer, and the current batch metadata columns.
9. PRESS: Run the independent source-versus-Bronze count query.
10. DO NOT CONTINUE UNTIL: Row counts and batch ID match and a rerun test has a documented result.

Command or code:

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

Where to enter it:

Databricks workspace in a web browser. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

What each part means:

1. CLICK: Open `databricks/notebooks/01_bronze_sqlserver.py` in the Databricks workspace or Git folder.
2. LOOK FOR: Confirm the notebook language is Python and the expected compute is attached or serverless is available.
3. LOOK FOR: Confirm the widget/parameter `batch_id` equals the uploaded batch folder exactly.
4. CLICK: Add or locate the entity-specific ingestion cell for `inventory_snapshots`.
5. TYPE THIS: Construct the entity path and target table from parameters; do not hard-code another user's catalog.
6. PRESS: Run the inspection cell first and display the raw schema and sample rows.
7. PRESS: Run the write cell only after the manifest entry and schema are understood.
8. LOOK FOR: A completed cell, a Delta target in Catalog Explorer, and the current batch metadata columns.
9. PRESS: Run the independent source-versus-Bronze count query.
10. DO NOT CONTINUE UNTIL: Row counts and batch ID match and a rerun test has a documented result.

What should happen:

A visible file, folder, branch, connection, table, notebook, task, relationship, measure, visual, or verification result should appear exactly where the action predicts.

Expected example:

Your exact values may differ. The expected result is the same *type* of object and the same required status, not necessarily the same timestamps, row counts, colors, generated IDs, or screen dimensions.

What may look different:

Menu wording can vary by product release or account tier. Use the official-source register and look for the described object rather than guessing from an old screenshot.

How to verify success:

Reopen or refresh the relevant panel, locate the named object, and inspect the property or output that proves it exists and is in the intended location.

Do not continue unless:

You can point to the visible result and explain what it proves. Mark the action VERIFIED BY USER only after that check.

Common mistake:

Combining several clicks or decisions, choosing a similarly named object, or continuing because no error dialog appeared.

Exact recovery:

Stop at the current screen. Save a screenshot of the error if useful, hide sensitive values, and compare the selected location with the starting condition. Use Back or Cancel rather than Delete or Overwrite. Correct one mismatch and repeat only this action.

What you just accomplished:

You completed one observable piece of the Northstar Retail platform and established a checkpoint that can be audited later.

How this connects to the project:

The resulting object, decision, or evidence becomes an input to the next stage in the source-to-consumption chain.

Manifest reconciliation

1. Read the expected count and checksum for inventory_snapshots from the uploaded manifest.
2. Count rows in bronze.erp_inventory_snapshots where _batch_id equals the current batch.
3. Confirm every row has a source file and ingestion timestamp.
4. Compare the distinct source-file list with the manifest path.
5. Record the actual result: [ENTER VERIFIED RESULT].

Quarantine behavior

Bronze preserves parseable raw rows. A completely unreadable file, malformed JSON line, missing required header, or manifest mismatch should fail or enter a technical quarantine according to the notebook contract. Business-invalid values remain available for Silver rules.

Common error and exact recovery

Representative error: PATH_NOT_FOUND, TABLE_OR_VIEW_NOT_FOUND, permission denied, or a schema mismatch.

Meaning: The input path, catalog/schema, permission, or assumed format does not match the uploaded batch.

Do not do: Do not create a new empty file at the missing path and do not change the batch ID until the mismatch disappears.

First diagnostic: List the volume directory and print the computed path.

Safest fix: Correct the upload location or parameter, then rerun only this entity cell.

Verification: The exact batch path is visible and counts reconcile.

Interview-ready explanation

"I created bronze.erp_inventory_snapshots as an auditable raw Delta table. I attached batch and file lineage, reconciled against a manifest, and tested same-batch behavior before allowing Silver to read it."

Bronze object 14 — bronze.digital_web_users

Input: web_users.csv or the equivalent entity extract in the uploaded Track A batch.

Target: Delta table bronze.digital_web_users.

Responsibility: Preserve raw source columns while adding ingestion metadata; Bronze is not the place for business cleaning.

Grain: One Bronze row per input record for web_users in one batch.

Required metadata: _batch_id, _source_file, _ingested_at, and source/system identifiers used by the project audit pattern.

Schema rule: Capture or declare the source shape deliberately. Unexpected columns/types must be visible, not silently discarded.

Rerun rule: Test the same batch twice. The implementation must either reject duplicate batch ingestion or prove a controlled idempotent strategy; unbounded append is not acceptable evidence.

Action 9.4.B14 — Ingest web_users into bronze.digital_web_users

Application:

Databricks workspace in a web browser

Window or panel:

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

Starting condition:

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Ingest web_users into bronze.digital_web_users. This is one bounded construction or inspection task.

Why this action comes now:

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

Exact physical actions:

1. CLICK: Open databricks/notebooks/02_bronze_postgres.py in the Databricks workspace or Git folder.
2. LOOK FOR: Confirm the notebook language is Python and the expected compute is attached or serverless is available.
3. LOOK FOR: Confirm the widget/parameter batch_id equals the uploaded batch folder exactly.
4. CLICK: Add or locate the entity-specific ingestion cell for web_users.
5. TYPE THIS: Construct the entity path and target table from parameters; do not hard-code another user's catalog.
6. PRESS: Run the inspection cell first and display the raw schema and sample rows.
7. PRESS: Run the write cell only after the manifest entry and schema are understood.
8. LOOK FOR: A completed cell, a Delta target in Catalog Explorer, and the current batch metadata columns.
9. PRESS: Run the independent source-versus-Bronze count query.
10. DO NOT CONTINUE UNTIL: Row counts and batch ID match and a rerun test has a documented result.

Command or code:

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

Where to enter it:

Databricks workspace in a web browser. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

Manifest reconciliation

1. Read the expected count and checksum for `web_users` from the uploaded manifest.
2. Count rows in `bronze.digital_web_users` where `_batch_id` equals the current batch.
3. Confirm every row has a source file and ingestion timestamp.
4. Compare the distinct source-file list with the manifest path.
5. Record the actual result: `[ENTER VERIFIED RESULT]`.

Quarantine behavior

Bronze preserves parseable raw rows. A completely unreadable file, malformed JSON line, missing required header, or manifest mismatch should fail or enter a technical quarantine according to the notebook contract. Business-invalid values remain available for Silver rules.

Common error and exact recovery

Representative error: `PATH_NOT_FOUND`, `TABLE_OR_VIEW_NOT_FOUND`, permission denied, or a schema mismatch.

Meaning: The input path, catalog/schema, permission, or assumed format does not match the uploaded batch.

Do not do: Do not create a new empty file at the missing path and do not change the batch ID until the mismatch disappears.

First diagnostic: List the volume directory and print the computed path.

Safest fix: Correct the upload location or parameter, then rerun only this entity cell.

Verification: The exact batch path is visible and counts reconcile.

Interview-ready explanation

"I created `bronze.digital_web_users` as an auditable raw Delta table. I attached batch and file lineage, reconciled against a manifest, and tested same-batch behavior before allowing Silver to read it."

Bronze object 15 — `bronze.digital_campaigns`

Input: `campaigns.csv` or the equivalent entity extract in the uploaded Track A batch.

Target: Delta table `bronze.digital_campaigns`.

Responsibility: Preserve raw source columns while adding ingestion metadata; Bronze is not the place for business cleaning.

Grain: One Bronze row per input record for `campaigns` in one batch.

Required metadata: `_batch_id`, `_source_file`, `_ingested_at`, and source/system identifiers used by the project audit pattern.

Schema rule: Capture or declare the source shape deliberately. Unexpected columns/types must be visible, not silently discarded.

Rerun rule: Test the same batch twice. The implementation must either reject duplicate batch ingestion or prove a controlled idempotent strategy; unbounded append is not acceptable evidence.

Action 9.4.B15 — Ingest campaigns into `bronze.digital_campaigns`

Application:

Databricks workspace in a web browser

Window or panel:

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

Starting condition:

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Ingest campaigns into `bronze.digital_campaigns`. This is one bounded construction or inspection task.

Why this action comes now:

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

Exact physical actions:

1. CLICK: Open `databricks/notebooks/02_bronze_postgres.py` in the Databricks workspace or Git folder.

2. LOOK FOR: Confirm the notebook language is Python and the expected compute is attached or serverless is available.
3. LOOK FOR: Confirm the widget/parameter `batch_id` equals the uploaded batch folder exactly.
4. CLICK: Add or locate the entity-specific ingestion cell for campaigns.
5. TYPE THIS: Construct the entity path and target table from parameters; do not hard-code another user's catalog.
6. PRESS: Run the inspection cell first and display the raw schema and sample rows.
7. PRESS: Run the write cell only after the manifest entry and schema are understood.
8. LOOK FOR: A completed cell, a Delta target in Catalog Explorer, and the current batch metadata columns.
9. PRESS: Run the independent source-versus-Bronze count query.
10. DO NOT CONTINUE UNTIL: Row counts and batch ID match and a rerun test has a documented result.

Command or code:

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

Where to enter it:

Databricks workspace in a web browser. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

What each part means:

1. CLICK: Open `databricks/notebooks/02_bronze_postgres.py` in the Databricks workspace or Git folder.
2. LOOK FOR: Confirm the notebook language is Python and the expected compute is attached or serverless is available.
3. LOOK FOR: Confirm the widget/parameter `batch_id` equals the uploaded batch folder exactly.
4. CLICK: Add or locate the entity-specific ingestion cell for campaigns.
5. TYPE THIS: Construct the entity path and target table from parameters; do not hard-code another user's catalog.
6. PRESS: Run the inspection cell first and display the raw schema and sample rows.
7. PRESS: Run the write cell only after the manifest entry and schema are understood.
8. LOOK FOR: A completed cell, a Delta target in Catalog Explorer, and the current batch metadata columns.
9. PRESS: Run the independent source-versus-Bronze count query.
10. DO NOT CONTINUE UNTIL: Row counts and batch ID match and a rerun test has a documented result.

What should happen:

A visible file, folder, branch, connection, table, notebook, task, relationship, measure, visual, or verification result should appear exactly where the action predicts.

Expected example:

Your exact values may differ. The expected result is the same *type* of object and the same required status, not necessarily the same timestamps, row counts, colors, generated IDs, or screen dimensions.

What may look different:

Menu wording can vary by product release or account tier. Use the official-source register and look for the described object rather than guessing from an old screenshot.

How to verify success:

Reopen or refresh the relevant panel, locate the named object, and inspect the property or output that proves it exists and is in the intended location.

Do not continue unless:

You can point to the visible result and explain what it proves. Mark the action VERIFIED BY USER only after that check.

Common mistake:

Combining several clicks or decisions, choosing a similarly named object, or continuing because no error dialog appeared.

Exact recovery:

Stop at the current screen. Save a screenshot of the error if useful, hide sensitive values, and compare the selected location with the starting condition. Use Back or Cancel rather than Delete or Overwrite. Correct one mismatch and repeat only this action.

What you just accomplished:

You completed one observable piece of the Northstar Retail platform and established a checkpoint that can be audited later.

How this connects to the project:

The resulting object, decision, or evidence becomes an input to the next stage in the source-to-consumption chain.

Manifest reconciliation

1. Read the expected count and checksum for `web_sessions` from the uploaded manifest.
2. Count rows in `bronze.digital_web_sessions` where `_batch_id` equals the current batch.
3. Confirm every row has a source file and ingestion timestamp.
4. Compare the distinct source-file list with the manifest path.
5. Record the actual result: [ENTER VERIFIED RESULT].

Quarantine behavior

Bronze preserves parseable raw rows. A completely unreadable file, malformed JSON line, missing required header, or manifest mismatch should fail or enter a technical quarantine according to the notebook contract. Business-invalid values remain available for Silver rules.

Common error and exact recovery

Representative error: PATH_NOT_FOUND, TABLE_OR_VIEW_NOT_FOUND, permission denied, or a schema mismatch.

Meaning: The input path, catalog/schema, permission, or assumed format does not match the uploaded batch.

Do not do: Do not create a new empty file at the missing path and do not change the batch ID until the mismatch disappears.

First diagnostic: List the volume directory and print the computed path.

Safest fix: Correct the upload location or parameter, then rerun only this entity cell.

Verification: The exact batch path is visible and counts reconcile.

Interview-ready explanation

"I created bronze.digital_web_sessions as an auditable raw Delta table. I attached batch and file lineage, reconciled against a manifest, and tested same-batch behavior before allowing Silver to read it."

Bronze object 17 — `bronze.digital_web_events`

Input: `web_events.csv` or the equivalent entity extract in the uploaded Track A batch.

Target: Delta table `bronze.digital_web_events`.

Responsibility: Preserve raw source columns while adding ingestion metadata; Bronze is not the place for business cleaning.

Grain: One Bronze row per input record for `web_events` in one batch.

Required metadata: `_batch_id`, `_source_file`, `_ingested_at`, and source/system identifiers used by the project audit pattern.

Schema rule: Capture or declare the source shape deliberately. Unexpected columns/types must be visible, not silently discarded.

Rerun rule: Test the same batch twice. The implementation must either reject duplicate batch ingestion or prove a controlled idempotent strategy; unbounded append is not acceptable evidence.

Action 9.4.B17 — Ingest `web_events` into `bronze.digital_web_events`

Application:

Databricks workspace in a web browser

Window or panel:

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

Starting condition:

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Ingest `web_events` into `bronze.digital_web_events`. This is one bounded construction or inspection task.

Why this action comes now:

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

Exact physical actions:

1. CLICK: Open `databricks/notebooks/02_bronze_postgres.py` in the Databricks workspace or Git folder.
2. LOOK FOR: Confirm the notebook language is Python and the expected compute is attached or serverless is available.
3. LOOK FOR: Confirm the widget/parameter `batch_id` equals the uploaded batch folder exactly.
4. CLICK: Add or locate the entity-specific ingestion cell for `web_events`.
5. TYPE THIS: Construct the entity path and target table from parameters; do not hard-code another user's catalog.
6. PRESS: Run the inspection cell first and display the raw schema and sample rows.
7. PRESS: Run the write cell only after the manifest entry and schema are understood.
8. LOOK FOR: A completed cell, a Delta target in Catalog Explorer, and the current batch metadata columns.
9. PRESS: Run the independent source-versus-Bronze count query.
10. DO NOT CONTINUE UNTIL: Row counts and batch ID match and a rerun test has a documented result.

Command or code:

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

Where to enter it:

Databricks workspace in a web browser. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

What each part means:

1. CLICK: Open `databricks/notebooks/02_bronze_postgres.py` in the Databricks workspace or Git folder.
2. LOOK FOR: Confirm the notebook language is Python and the expected compute is attached or serverless is available.
3. LOOK FOR: Confirm the widget/parameter `batch_id` equals the uploaded batch folder exactly.
4. CLICK: Add or locate the entity-specific ingestion cell for `web_events`.
5. TYPE THIS: Construct the entity path and target table from parameters; do not hard-code another user's catalog.
6. PRESS: Run the inspection cell first and display the raw schema and sample rows.

7. PRESS: Run the write cell only after the manifest entry and schema are understood.
8. LOOK FOR: A completed cell, a Delta target in Catalog Explorer, and the current batch metadata columns.
9. PRESS: Run the independent source-versus-Bronze count query.
10. DO NOT CONTINUE UNTIL: Row counts and batch ID match and a rerun test has a documented result.

What should happen:

A visible file, folder, branch, connection, table, notebook, task, relationship, measure, visual, or verification result should appear exactly where the action predicts.

Expected example:

Your exact values may differ. The expected result is the same *type* of object and the same required status, not necessarily the same timestamps, row counts, colors, generated IDs, or screen dimensions.

What may look different:

Menu wording can vary by product release or account tier. Use the official-source register and look for the described object rather than guessing from an old screenshot.

How to verify success:

Reopen or refresh the relevant panel, locate the named object, and inspect the property or output that proves it exists and is in the intended location.

Do not continue unless:

You can point to the visible result and explain what it proves. Mark the action VERIFIED BY USER only after that check.

Common mistake:

Combining several clicks or decisions, choosing a similarly named object, or continuing because no error dialog appeared.

Exact recovery:

Stop at the current screen. Save a screenshot of the error if useful, hide sensitive values, and compare the selected location with the starting condition. Use Back or Cancel rather than Delete or Overwrite. Correct one mismatch and repeat only this action.

What you just accomplished:

You completed one observable piece of the Northstar Retail platform and established a checkpoint that can be audited later.

How this connects to the project:

The resulting object, decision, or evidence becomes an input to the next stage in the source-to-consumption chain.

Manifest reconciliation

1. Read the expected count and checksum for `campaign_touchpoints` from the uploaded manifest.
2. Count rows in `bronze.digital_campaign_touchpoints` where `_batch_id` equals the current batch.
3. Confirm every row has a source file and ingestion timestamp.
4. Compare the distinct source-file list with the manifest path.
5. Record the actual result: `[ENTER VERIFIED RESULT]`.

Quarantine behavior

Bronze preserves parseable raw rows. A completely unreadable file, malformed JSON line, missing required header, or manifest mismatch should fail or enter a technical quarantine according to the notebook contract. Business-invalid values remain available for Silver rules.

Common error and exact recovery

Representative error: `PATH_NOT_FOUND`, `TABLE_OR_VIEW_NOT_FOUND`, permission denied, or a schema mismatch.

Meaning: The input path, catalog/schema, permission, or assumed format does not match the uploaded batch.

Do not do: Do not create a new empty file at the missing path and do not change the batch ID until the mismatch disappears.

First diagnostic: List the volume directory and print the computed path.

Safest fix: Correct the upload location or parameter, then rerun only this entity cell.

Verification: The exact batch path is visible and counts reconcile.

Interview-ready explanation

"I created `bronze.digital_campaign_touchpoints` as an auditable raw Delta table. I attached batch and file lineage, reconciled against a manifest, and tested same-batch behavior before allowing Silver to read it."

Bronze object 19 — `bronze.digital_marketing_spend`

Input: `marketing_spend.csv` or the equivalent entity extract in the uploaded Track A batch.

Target: Delta table `bronze.digital_marketing_spend`.

Responsibility: Preserve raw source columns while adding ingestion metadata; Bronze is not the place for business clean-

ing.

Grain: One Bronze row per input record for `marketing_spend` in one batch.

Required metadata: `_batch_id`, `_source_file`, `_ingested_at`, and source/system identifiers used by the project audit pattern.

Schema rule: Capture or declare the source shape deliberately. Unexpected columns/types must be visible, not silently discarded.

Rerun rule: Test the same batch twice. The implementation must either reject duplicate batch ingestion or prove a controlled idempotent strategy; unbounded append is not acceptable evidence.

Action 9.4.B19 — Ingest `marketing_spend` into `bronze.digital_marketing_spend`

Application:

Databricks workspace in a web browser

Window or panel:

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

Starting condition:

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Ingest `marketing_spend` into `bronze.digital_marketing_spend`. This is one bounded construction or inspection task.

Why this action comes now:

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

Exact physical actions:

1. CLICK: Open `databricks/notebooks/02_bronze_postgres.py` in the Databricks workspace or Git folder.
2. LOOK FOR: Confirm the notebook language is Python and the expected compute is attached or serverless is available.
3. LOOK FOR: Confirm the widget/parameter `batch_id` equals the uploaded batch folder exactly.
4. CLICK: Add or locate the entity-specific ingestion cell for `marketing_spend`.
5. TYPE THIS: Construct the entity path and target table from parameters; do not hard-code another user's catalog.
6. PRESS: Run the inspection cell first and display the raw schema and sample rows.
7. PRESS: Run the write cell only after the manifest entry and schema are understood.
8. LOOK FOR: A completed cell, a Delta target in Catalog Explorer, and the current batch metadata columns.
9. PRESS: Run the independent source-versus-Bronze count query.
10. DO NOT CONTINUE UNTIL: Row counts and batch ID match and a rerun test has a documented result.

Command or code:

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

Where to enter it:

Databricks workspace in a web browser. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

What each part means:

1. CLICK: Open `databricks/notebooks/02_bronze_postgres.py` in the Databricks workspace or Git folder.
2. LOOK FOR: Confirm the notebook language is Python and the expected compute is attached or serverless is available.
3. LOOK FOR: Confirm the widget/parameter `batch_id` equals the uploaded batch folder exactly.
4. CLICK: Add or locate the entity-specific ingestion cell for `marketing_spend`.
5. TYPE THIS: Construct the entity path and target table from parameters; do not hard-code another user's catalog.
6. PRESS: Run the inspection cell first and display the raw schema and sample rows.
7. PRESS: Run the write cell only after the manifest entry and schema are understood.
8. LOOK FOR: A completed cell, a Delta target in Catalog Explorer, and the current batch metadata columns.
9. PRESS: Run the independent source-versus-Bronze count query.
10. DO NOT CONTINUE UNTIL: Row counts and batch ID match and a rerun test has a documented result.

What should happen:

A visible file, folder, branch, connection, table, notebook, task, relationship, measure, visual, or verification result should appear exactly where the action predicts.

Expected example:

Your exact values may differ. The expected result is the same *type* of object and the same required status, not necessarily the same timestamps, row counts, colors, generated IDs, or screen dimensions.

What may look different:

Menu wording can vary by product release or account tier. Use the official-source register and look for the described object rather than guessing from an old screenshot.

How to verify success:

Reopen or refresh the relevant panel, locate the named object, and inspect the property or output that proves it exists and is in the intended location.

Do not continue unless:

You can point to the visible result and explain what it proves. Mark the action VERIFIED BY USER only after that check.

Common mistake:

Combining several clicks or decisions, choosing a similarly named object, or continuing because no error dialog appeared.

Exact recovery:

Stop at the current screen. Save a screenshot of the error if useful, hide sensitive values, and compare the selected location with the starting condition. Use Back or Cancel rather than Delete or Overwrite. Correct one mismatch and repeat only this action.

What you just accomplished:

You completed one observable piece of the Northstar Retail platform and established a checkpoint that can be audited later.

How this connects to the project:

The resulting object, decision, or evidence becomes an input to the next stage in the source-to-consumption chain.

Manifest reconciliation

1. Read the expected count and checksum for `marketing_spend` from the uploaded manifest.
2. Count rows in `bronze.digital_marketing_spend` where `_batch_id` equals the current batch.

3. Confirm every row has a source file and ingestion timestamp.
4. Compare the distinct source-file list with the manifest path.
5. Record the actual result: [ENTER VERIFIED RESULT].

Quarantine behavior

Bronze preserves parseable raw rows. A completely unreadable file, malformed JSON line, missing required header, or manifest mismatch should fail or enter a technical quarantine according to the notebook contract. Business-invalid values remain available for Silver rules.

Common error and exact recovery

Representative error: PATH_NOT_FOUND, TABLE_OR_VIEW_NOT_FOUND, permission denied, or a schema mismatch.

Meaning: The input path, catalog/schema, permission, or assumed format does not match the uploaded batch.

Do not do: Do not create a new empty file at the missing path and do not change the batch ID until the mismatch disappears.

First diagnostic: List the volume directory and print the computed path.

Safest fix: Correct the upload location or parameter, then rerun only this entity cell.

Verification: The exact batch path is visible and counts reconcile.

Interview-ready explanation

"I created `bronze.digital_marketing_spend` as an auditable raw Delta table. I attached batch and file lineage, reconciled against a manifest, and tested same-batch behavior before allowing Silver to read it."

Bronze object 20 — `bronze.file_returns`

Input: `returns.csv` or the equivalent entity extract in the uploaded Track A batch.

Target: Delta table `bronze.file_returns`.

Responsibility: Preserve raw source columns while adding ingestion metadata; Bronze is not the place for business cleaning.

Grain: One Bronze row per input record for returns in one batch.

Required metadata: `_batch_id`, `_source_file`, `_ingested_at`, and source/system identifiers used by the project audit pattern.

Schema rule: Capture or declare the source shape deliberately. Unexpected columns/types must be visible, not silently discarded.

Rerun rule: Test the same batch twice. The implementation must either reject duplicate batch ingestion or prove a controlled idempotent strategy; unbounded append is not acceptable evidence.

Action 9.4.B20 — Ingest returns into `bronze.file_returns`

Application:

Databricks workspace in a web browser

Window or panel:

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

Starting condition:

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Ingest returns into `bronze.file_returns`. This is one bounded construction or inspection task.

Why this action comes now:

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

Exact physical actions:

1. CLICK: Open `databricks/notebooks/03_bronze_files.py` in the Databricks workspace or Git folder.
2. LOOK FOR: Confirm the notebook language is Python and the expected compute is attached or serverless is available.
3. LOOK FOR: Confirm the widget/parameter `batch_id` equals the uploaded batch folder exactly.
4. CLICK: Add or locate the entity-specific ingestion cell for returns.

5. TYPE THIS: Construct the entity path and target table from parameters; do not hard-code another user's catalog.
6. PRESS: Run the inspection cell first and display the raw schema and sample rows.
7. PRESS: Run the write cell only after the manifest entry and schema are understood.
8. LOOK FOR: A completed cell, a Delta target in Catalog Explorer, and the current batch metadata columns.
9. PRESS: Run the independent source-versus-Bronze count query.
10. DO NOT CONTINUE UNTIL: Row counts and batch ID match and a rerun test has a documented result.

Command or code:

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

Where to enter it:

Databricks workspace in a web browser. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

What each part means:

1. CLICK: Open `databricks/notebooks/03_bronze_files.py` in the Databricks workspace or Git folder.
2. LOOK FOR: Confirm the notebook language is Python and the expected compute is attached or serverless is available.
3. LOOK FOR: Confirm the widget/parameter `batch_id` equals the uploaded batch folder exactly.
4. CLICK: Add or locate the entity-specific ingestion cell for returns.
5. TYPE THIS: Construct the entity path and target table from parameters; do not hard-code another user's catalog.
6. PRESS: Run the inspection cell first and display the raw schema and sample rows.
7. PRESS: Run the write cell only after the manifest entry and schema are understood.
8. LOOK FOR: A completed cell, a Delta target in Catalog Explorer, and the current batch metadata columns.
9. PRESS: Run the independent source-versus-Bronze count query.
10. DO NOT CONTINUE UNTIL: Row counts and batch ID match and a rerun test has a documented result.

What should happen:

A visible file, folder, branch, connection, table, notebook, task, relationship, measure, visual, or verification result should appear exactly where the action predicts.

Expected example:

Your exact values may differ. The expected result is the same *type* of object and the same required status, not necessarily the same timestamps, row counts, colors, generated IDs, or screen dimensions.

What may look different:

Menu wording can vary by product release or account tier. Use the official-source register and look for the described object rather than guessing from an old screenshot.

How to verify success:

Reopen or refresh the relevant panel, locate the named object, and inspect the property or output that proves it exists and is in the intended location.

Do not continue unless:

You can point to the visible result and explain what it proves. Mark the action VERIFIED BY USER only after that check.

Common mistake:

Combining several clicks or decisions, choosing a similarly named object, or continuing because no error dialog appeared.

Exact recovery:

Stop at the current screen. Save a screenshot of the error if useful, hide sensitive values, and compare the selected location with the starting condition. Use Back or Cancel rather than Delete or Overwrite. Correct one mismatch and repeat only this action.

What you just accomplished:

You completed one observable piece of the Northstar Retail platform and established a checkpoint that can be audited later.

Manifest reconciliation

1. Read the expected count and checksum for returns from the uploaded manifest.
2. Count rows in `bronze.file_returns` where `_batch_id` equals the current batch.
3. Confirm every row has a source file and ingestion timestamp.
4. Compare the distinct source-file list with the manifest path.
5. Record the actual result: [ENTER VERIFIED RESULT].

Quarantine behavior

Bronze preserves parseable raw rows. A completely unreadable file, malformed JSON line, missing required header, or manifest mismatch should fail or enter a technical quarantine according to the notebook contract. Business-invalid values remain available for Silver rules.

Common error and exact recovery

Representative error: `PATH_NOT_FOUND`, `TABLE_OR_VIEW_NOT_FOUND`, permission denied, or a schema mismatch.

Meaning: The input path, catalog/schema, permission, or assumed format does not match the uploaded batch.

Do not do: Do not create a new empty file at the missing path and do not change the batch ID until the mismatch disappears.

First diagnostic: List the volume directory and print the computed path.

Safest fix: Correct the upload location or parameter, then rerun only this entity cell.

Verification: The exact batch path is visible and counts reconcile.

Interview-ready explanation

"I created `bronze.file_returns` as an auditable raw Delta table. I attached batch and file lineage, reconciled against a manifest, and tested same-batch behavior before allowing Silver to read it."

Bronze object 21 — `bronze.file_supplier_cost_updates`

Input: `supplier_cost_updates.csv` or the equivalent entity extract in the uploaded Track A batch.

Target: Delta table `bronze.file_supplier_cost_updates`.

Responsibility: Preserve raw source columns while adding ingestion metadata; Bronze is not the place for business cleaning.

Grain: One Bronze row per input record for `supplier_cost_updates` in one batch.

Required metadata: `_batch_id`, `_source_file`, `_ingested_at`, and source/system identifiers used by the project audit pattern.

Schema rule: Capture or declare the source shape deliberately. Unexpected columns/types must be visible, not silently discarded.

Rerun rule: Test the same batch twice. The implementation must either reject duplicate batch ingestion or prove a controlled idempotent strategy; unbounded append is not acceptable evidence.

Action 9.4.B21 — Ingest `supplier_cost_updates` into `bronze.file_supplier_cost_updates`

Application:

Databricks workspace in a web browser

Window or panel:

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

Starting condition:

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Ingest `supplier_cost_updates` into `bronze.file_supplier_cost_updates`. This is one bounded construction or inspection task.

Why this action comes now:

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

Exact physical actions:

1. CLICK: Open `databricks/notebooks/03_bronze_files.py` in the Databricks workspace or Git folder.
2. LOOK FOR: Confirm the notebook language is Python and the expected compute is attached or serverless is available.
3. LOOK FOR: Confirm the widget/parameter `batch_id` equals the uploaded batch folder exactly.
4. CLICK: Add or locate the entity-specific ingestion cell for `supplier_cost_updates`.
5. TYPE THIS: Construct the entity path and target table from parameters; do not hard-code another user's catalog.
6. PRESS: Run the inspection cell first and display the raw schema and sample rows.
7. PRESS: Run the write cell only after the manifest entry and schema are understood.
8. LOOK FOR: A completed cell, a Delta target in Catalog Explorer, and the current batch metadata columns.
9. PRESS: Run the independent source-versus-Bronze count query.
10. DO NOT CONTINUE UNTIL: Row counts and batch ID match and a rerun test has a documented result.

Command or code:

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

Where to enter it:

Databricks workspace in a web browser. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

What each part means:

1. CLICK: Open `databricks/notebooks/03_bronze_files.py` in the Databricks workspace or Git folder.
2. LOOK FOR: Confirm the notebook language is Python and the expected compute is attached or serverless is available.
3. LOOK FOR: Confirm the widget/parameter `batch_id` equals the uploaded batch folder exactly.
4. CLICK: Add or locate the entity-specific ingestion cell for `supplier_cost_updates`.
5. TYPE THIS: Construct the entity path and target table from parameters; do not hard-code another user's catalog.
6. PRESS: Run the inspection cell first and display the raw schema and sample rows.
7. PRESS: Run the write cell only after the manifest entry and schema are understood.
8. LOOK FOR: A completed cell, a Delta target in Catalog Explorer, and the current batch metadata columns.
9. PRESS: Run the independent source-versus-Bronze count query.
10. DO NOT CONTINUE UNTIL: Row counts and batch ID match and a rerun test has a documented result.

What should happen:

A visible file, folder, branch, connection, table, notebook, task, relationship, measure, visual, or verification result should appear exactly where the action predicts.

Expected example:

Your exact values may differ. The expected result is the same *type* of object and the same required status, not necessarily the same timestamps, row counts, colors, generated IDs, or screen dimensions.

What may look different:

Menu wording can vary by product release or account tier. Use the official-source register and look for the described object rather than guessing from an old screenshot.

How to verify success:

Reopen or refresh the relevant panel, locate the named object, and inspect the property or output that proves it exists and is in the intended location.

Do not continue unless:

You can point to the visible result and explain what it proves. Mark the action VERIFIED BY USER only after that check.

Common mistake:

Combining several clicks or decisions, choosing a similarly named object, or continuing because no error dialog appeared.

Exact recovery:

Stop at the current screen. Save a screenshot of the error if useful, hide sensitive values, and compare the selected location with the starting condition. Use Back or Cancel rather than Delete or Overwrite. Correct one mismatch and repeat only this action.

What you just accomplished:

You completed one observable piece of the Northstar Retail platform and established a checkpoint that can be audited later.

How this connects to the project:

The resulting object, decision, or evidence becomes an input to the next stage in the source-to-consumption chain.

Manifest reconciliation

1. Read the expected count and checksum for `supplier_cost_updates` from the uploaded manifest.
2. Count rows in `bronze.file_supplier_cost_updates` where `_batch_id` equals the current batch.
3. Confirm every row has a source file and ingestion timestamp.
4. Compare the distinct source-file list with the manifest path.
5. Record the actual result: [ENTER VERIFIED RESULT].

Quarantine behavior

Bronze preserves parseable raw rows. A completely unreadable file, malformed JSON line, missing required header, or manifest mismatch should fail or enter a technical quarantine according to the notebook contract. Business-invalid values remain available for Silver rules.

Common error and exact recovery

Representative error: PATH_NOT_FOUND, TABLE_OR_VIEW_NOT_FOUND, permission denied, or a schema mismatch.

Meaning: The input path, catalog/schema, permission, or assumed format does not match the uploaded batch.

Do not do: Do not create a new empty file at the missing path and do not change the batch ID until the mismatch disappears.

First diagnostic: List the volume directory and print the computed path.

Safest fix: Correct the upload location or parameter, then rerun only this entity cell.

Verification: The exact batch path is visible and counts reconcile.

Interview-ready explanation

"I created `bronze.file_supplier_cost_updates` as an auditable raw Delta table. I attached batch and file lineage, reconciled against a manifest, and tested same-batch behavior before allowing Silver to read it."

Bronze object 22 — `bronze.file_promotion_calendar`

Input: `promotion_calendar.csv` or the equivalent entity extract in the uploaded Track A batch.

Target: Delta table `bronze.file_promotion_calendar`.

Responsibility: Preserve raw source columns while adding ingestion metadata; Bronze is not the place for business cleaning.

Grain: One Bronze row per input record for `promotion_calendar` in one batch.

Required metadata: `_batch_id`, `_source_file`, `_ingested_at`, and source/system identifiers used by the project audit pattern.

Schema rule: Capture or declare the source shape deliberately. Unexpected columns/types must be visible, not silently discarded.

Rerun rule: Test the same batch twice. The implementation must either reject duplicate batch ingestion or prove a controlled idempotent strategy; unbounded append is not acceptable evidence.

Action 9.4.B22 — Ingest `promotion_calendar` into `bronze.file_promotion_calendar`

Application:

Databricks workspace in a web browser

Window or panel:

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

Starting condition:

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Ingest `promotion_calendar` into `bronze.file_promotion_calendar`. This is one bounded construction or inspection task.

Why this action comes now:

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

Exact physical actions:

1. CLICK: Open `databricks/notebooks/03_bronze_files.py` in the Databricks workspace or Git folder.
2. LOOK FOR: Confirm the notebook language is Python and the expected compute is attached or serverless is available.
3. LOOK FOR: Confirm the widget/parameter `batch_id` equals the uploaded batch folder exactly.
4. CLICK: Add or locate the entity-specific ingestion cell for `promotion_calendar`.
5. TYPE THIS: Construct the entity path and target table from parameters; do not hard-code another user's catalog.
6. PRESS: Run the inspection cell first and display the raw schema and sample rows.
7. PRESS: Run the write cell only after the manifest entry and schema are understood.
8. LOOK FOR: A completed cell, a Delta target in Catalog Explorer, and the current batch metadata columns.

9. PRESS: Run the independent source-versus-Bronze count query.
10. DO NOT CONTINUE UNTIL: Row counts and batch ID match and a rerun test has a documented result.

Command or code:

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

Where to enter it:

Databricks workspace in a web browser. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

What each part means:

5. Record the actual result: `[ENTER VERIFIED RESULT]`.

Quarantine behavior

Bronze preserves parseable raw rows. A completely unreadable file, malformed JSON line, missing required header, or manifest mismatch should fail or enter a technical quarantine according to the notebook contract. Business-invalid values remain available for Silver rules.

Common error and exact recovery

Representative error: `PATH_NOT_FOUND`, `TABLE_OR_VIEW_NOT_FOUND`, permission denied, or a schema mismatch.

Meaning: The input path, catalog/schema, permission, or assumed format does not match the uploaded batch.

Do not do: Do not create a new empty file at the missing path and do not change the batch ID until the mismatch disappears.

First diagnostic: List the volume directory and print the computed path.

Safest fix: Correct the upload location or parameter, then rerun only this entity cell.

Verification: The exact batch path is visible and counts reconcile.

Interview-ready explanation

"I created `bronze.file_promotion_calendar` as an auditable raw Delta table. I attached batch and file lineage, reconciled against a manifest, and tested same-batch behavior before allowing Silver to read it."

Bronze object 23 — `bronze.file_shipment_tracking_events`

Input: `shipment_tracking_events.jsonl` or the equivalent entity extract in the uploaded Track A batch.

Target: Delta table `bronze.file_shipment_tracking_events`.

Responsibility: Preserve raw source columns while adding ingestion metadata; Bronze is not the place for business cleaning.

Grain: One Bronze row per input record for `shipment_tracking_events` in one batch.

Required metadata: `_batch_id`, `_source_file`, `_ingested_at`, and source/system identifiers used by the project audit pattern.

Schema rule: Capture or declare the source shape deliberately. Unexpected columns/types must be visible, not silently discarded.

Rerun rule: Test the same batch twice. The implementation must either reject duplicate batch ingestion or prove a controlled idempotent strategy; unbounded append is not acceptable evidence.

Action 9.4.B23 — Ingest shipment_tracking_events into bronze.file_shipment_tracking_events

Application:

Databricks workspace in a web browser

Window or panel:

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

Starting condition:

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Ingest shipment_tracking_events into bronze.file_shipment_tracking_events. This is one bounded construction or inspection task.

Why this action comes now:

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

Exact physical actions:

1. CLICK: Open databricks/notebooks/03_bronze_files.py in the Databricks workspace or Git folder.
2. LOOK FOR: Confirm the notebook language is Python and the expected compute is attached or serverless is available.
3. LOOK FOR: Confirm the widget/parameter batch_id equals the uploaded batch folder exactly.
4. CLICK: Add or locate the entity-specific ingestion cell for shipment_tracking_events.
5. TYPE THIS: Construct the entity path and target table from parameters; do not hard-code another user's catalog.
6. PRESS: Run the inspection cell first and display the raw schema and sample rows.
7. PRESS: Run the write cell only after the manifest entry and schema are understood.
8. LOOK FOR: A completed cell, a Delta target in Catalog Explorer, and the current batch metadata columns.
9. PRESS: Run the independent source-versus-Bronze count query.
10. DO NOT CONTINUE UNTIL: Row counts and batch ID match and a rerun test has a documented result.

Command or code:

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

Where to enter it:

Databricks workspace in a web browser. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

What each part means:

1. CLICK: Open databricks/notebooks/03_bronze_files.py in the Databricks workspace or Git folder.
2. LOOK FOR: Confirm the notebook language is Python and the expected compute is attached or serverless is available.
3. LOOK FOR: Confirm the widget/parameter batch_id equals the uploaded batch folder exactly.
4. CLICK: Add or locate the entity-specific ingestion cell for shipment_tracking_events.
5. TYPE THIS: Construct the entity path and target table from parameters; do not hard-code another user's catalog.
6. PRESS: Run the inspection cell first and display the raw schema and sample rows.
7. PRESS: Run the write cell only after the manifest entry and schema are understood.
8. LOOK FOR: A completed cell, a Delta target in Catalog Explorer, and the current batch metadata columns.
9. PRESS: Run the independent source-versus-Bronze count query.
10. DO NOT CONTINUE UNTIL: Row counts and batch ID match and a rerun test has a documented result.

What should happen:

A visible file, folder, branch, connection, table, notebook, task, relationship, measure, visual, or verification result should appear exactly where the action predicts.

Expected example:

Your exact values may differ. The expected result is the same *type* of object and the same required status, not necessarily the same timestamps, row counts, colors, generated IDs, or screen dimensions.

What may look different:

Menu wording can vary by product release or account tier. Use the official-source register and look for the described object rather than guessing from an old screenshot.

How to verify success:

Reopen or refresh the relevant panel, locate the named object, and inspect the property or output that proves it exists and is in the intended location.

Do not continue unless:

You can point to the visible result and explain what it proves. Mark the action VERIFIED BY USER only after that check.

Common mistake:

Combining several clicks or decisions, choosing a similarly named object, or continuing because no error dialog appeared.

Exact recovery:

Stop at the current screen. Save a screenshot of the error if useful, hide sensitive values, and compare the selected location with the starting condition. Use Back or Cancel rather than Delete or Overwrite. Correct one mismatch and repeat only this action.

What you just accomplished:

You completed one observable piece of the Northstar Retail platform and established a checkpoint that can be audited later.

How this connects to the project:

The resulting object, decision, or evidence becomes an input to the next stage in the source-to-consumption chain.

- **Line 9:** `.mode("append")` — `.` is a path, relative location, branch-style name, or file argument; verify every character before running it; `mode` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `(` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `"append"` is a quoted literal; the quotation marks preserve spaces or mark text; `)` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation
- **Line 10:** `.saveAsTable(target_table)` — `.` is a path, relative location, branch-style name, or file argument; verify every character before running it; `saveAsTable` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `(` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `target_table` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `)` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation

Manifest reconciliation

1. Read the expected count and checksum for `shipment_tracking_events` from the uploaded manifest.
2. Count rows in `bronze.file_shipment_tracking_events` where `_batch_id` equals the current batch.
3. Confirm every row has a source file and ingestion timestamp.
4. Compare the distinct source-file list with the manifest path.
5. Record the actual result: [ENTER VERIFIED RESULT].

Quarantine behavior

Bronze preserves parseable raw rows. A completely unreadable file, malformed JSON line, missing required header, or manifest mismatch should fail or enter a technical quarantine according to the notebook contract. Business-invalid values remain available for Silver rules.

Common error and exact recovery

Representative error: PATH_NOT_FOUND, TABLE_OR_VIEW_NOT_FOUND, permission denied, or a schema mismatch.

Meaning: The input path, catalog/schema, permission, or assumed format does not match the uploaded batch.

Do not do: Do not create a new empty file at the missing path and do not change the batch ID until the mismatch disappears.

First diagnostic: List the volume directory and print the computed path.

Safest fix: Correct the upload location or parameter, then rerun only this entity cell.

Verification: The exact batch path is visible and counts reconcile.

Interview-ready explanation

"I created bronze.file_shipment_tracking_events as an auditable raw Delta table. I attached batch and file lineage, reconciled against a manifest, and tested same-batch behavior before allowing Silver to read it."

What your screen should look like now

- The new Phase 9 objects are visible in their owning application.
- The current branch remains the intended feature branch.
- The current database, catalog, schema, Power BI model, or GitHub run is still identifiable.
- Verification output is visible or recorded; no object is marked complete solely because creation code was displayed.
- Any failed toy demonstration has been repaired or isolated.

Lesson 9.4 completion checklist

☐

Every required object was built separately — [STATUS]

☐

Every object has a declared responsibility/grain — [STATUS]

☐

Inputs and outputs were inspected — [STATUS]

☐

A rerun or alternate-result branch was tested where applicable — [STATUS]

☐

Counts, keys, measures, relationships, or settings were independently validated — [STATUS]

☐

I can explain one failure and its safest recovery — [STATUS]

Safe stopping point

Stop only after the active command, database transaction, Databricks cell/Job, Python process, warehouse load, or Power BI refresh finishes. Save all files and the Power BI project. Record uncommitted Git changes and exact resume action. Resume at [Lesson 9.5](#).

Lesson 9.5 — Verify, troubleshoot, commit, teach back, and stop safely

What your screen should look like before starting

The Phase 9 outputs are visible, all runs are finished, open files are saved, and you can state the active branch and execution context. Any error you encountered has a recorded message and has not been hidden by deleting evidence.

Design decision — Verification before automation

Question:

Should the phase prioritize a visible manual verification or jump directly to automation?

Options considered:

- Manual verification first, then automation.
- Automation without a known-good baseline.
- Manual operation forever.

Beginner path selected:

Establish one verified manual baseline and then automate repeatable checks.

Why this path was selected:

A known-good example makes failures interpretable and prevents automation from hiding a wrong assumption.

Tradeoff:

The first run takes longer.

What a company might do instead:

Teams often pair infrastructure as code and automated tests with controlled bootstrap and acceptance procedures.

How to explain this in an interview:

I established a verified baseline, then encoded the same contract in tests and orchestration so automation preserved meaning rather than just speed.

If you see Result A

Bronze row counts and metadata reconcile to the manifest, including rerun behavior. Record the exact result, perform the named independent verification, and continue only when the gate is satisfied.

If you see Result B

A file is missing, malformed, quarantined, duplicated, or matched to the wrong manifest entry. Treat this as information, not permission to delete or overwrite. Follow the branch-specific diagnostic in the current action, preserve evidence, and continue only after the state is understood.

If you see an error

Read the first meaningful error line, redact secrets, and verify the application, path, branch, server/database, catalog/schema, batch ID, parameters, version/tier, and object name. Run the smallest observational check first. Do not reset Git history, drop data, disable a rule, force-push, or replace the target merely to make the error disappear.

Phase-specific verification gate

☐

Required files/objects exist in the exact location.

☐

I personally created or configured them.

☐

I ran the phase commands in the documented context.

☐

I inspected the output rather than relying on a green icon alone.

☐

Counts, keys, relationships, measures, checksums, statuses, or settings meet the declared contract.

☐

Same-batch/rerun behavior is known where applicable.

☐

A controlled failure or realistic alternate-result branch was tested safely where applicable.

☐

No password, token, or secret appears in tracked files, screenshots, notebook output, terminal history pasted into documentation, or staged changes.

☐

Actual verified result: [ENTER VERIFIED RESULT].

Point-of-failure troubleshooting record

Exact or representative error message:

[PASTE THE FIRST MEANINGFUL ERROR, WITH SECRETS REDACTED]

What it means in plain language:

[WRITE YOUR INTERPRETATION]

Most likely cause:

[WRITE ONE TESTABLE HYPOTHESIS]

What not to do:

Do not delete data, drop databases, reset Git history, force-push, disable constraints, edit raw evidence, change a quality threshold, or expose credentials merely to make the symptom disappear.

First diagnostic action:

[ENTER THE SMALLEST OBSERVATIONAL CHECK]

How to read the diagnostic result:

[RESULT A MEANS... / RESULT B MEANS...]

Safest fix:

[ENTER THE NARROW FIX]

Alternative fix when applicable:

[ENTER OR N/A]

How to verify the fix:

[ENTER THE INDEPENDENT RECHECK]

How to return to the main tutorial:

Resume at the exact action number that failed; do not skip its verification gate.

Screenshot checkpoint

Application(s) that should be visible: Databricks workspace, Catalog Explorer, notebooks, and Jobs-compatible compute.

Window/panel: Show Bronze tables, metadata columns, manifest reconciliation, and same-batch behavior.

Sensitive information to hide: Passwords, tokens, connection strings, email addresses, cloud account IDs, unnecessary Windows profile details, and any secret revealed by an error.

Include: The object name, batch/run ID when relevant, result/status, and enough surrounding UI to prove which application and layer is shown.

Crop out: Unrelated desktop windows, notification previews, bookmarks, chat, and empty background.

Recommended filename: docs/images/phase09_build-the-bronze-ingestion-layer_verified.png.

Recommended repository folder: docs/images/.

README placement: The section describing Phase 9's verified result; do not use the image before the result is actually verified.

What it proves: The visible state existed under the shown context. It does not prove hidden rows, other batches, every filter combination, or a later run.

[ADD YOUR VERIFIED SCREENSHOT HERE]

Git checkpoint after the verified Phase 9 changes

Do not use `git add .` until you understand that it stages every matching change under the current directory, including files you did not intend. Prefer targeted staging after inspecting status and diffs.

Save open work

1. PRESS: In VS Code, press Ctrl+K, then S if you use **Save All**, or press Ctrl+S in every modified editor.
2. In Power BI, press Ctrl+S and confirm the local file location.
3. Wait for database, Python, Databricks, and refresh operations to finish; Git does not capture uncommitted database/cloud state.

Action 9.5.G1 — Verify the repository root before Git operations

Application:

Windows PowerShell or the VS Code PowerShell terminal

Window or panel:

VS Code integrated PowerShell terminal

Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

Exact physical actions:

1. CLICK: Bring **Windows PowerShell or the VS Code PowerShell terminal** to the front.
2. LOOK FOR: Confirm the current location matches The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

Command or code (PowerShell):

```
git rev-parse --show-toplevel
```

Where to enter it:

VS Code integrated PowerShell terminal. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

What each part means:

- **Line 1:** `git rev-parse --show-toplevel` — `git` calls the Git version-control program; `rev-parse` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `--show` is a command option or flag; its exact behavior is defined beside the command; `-toplevel` is a command option or flag; its exact behavior is defined beside the command

Does it change anything?

This is intended to inspect or validate state rather than change it.

Is it safe to rerun?

Normally safe to rerun because it is observational, but still confirm the execution location first.

What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

Do not continue unless:

The result is visible, understandable, and recorded as RUN BY USER or VERIFIED BY USER. Displaying this workbook does not count as execution.

Common mistake:

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

Exact recovery:

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

What you just accomplished:

You executed and checked one controlled operation rather than treating a long script as a black box.

How this connects to the project:

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 9 lesson index](#)

Action 9.5.G2 — Verify the active Git branch

Application:

Windows PowerShell or the VS Code PowerShell terminal

Window or panel:

VS Code integrated PowerShell terminal

Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

Exact physical actions:

1. CLICK: Bring **Windows PowerShell or the VS Code PowerShell terminal** to the front.
2. LOOK FOR: Confirm the current location matches The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

Command or code (PowerShell):

```
git branch --show-current
```

Where to enter it:

VS Code integrated PowerShell terminal. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

What each part means:

- **Line 1:** `git branch --show-current` — `git` calls the Git version-control program; `branch` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `--show` is a command option or flag; its exact behavior is defined beside the command; `-current` is a command option or flag; its exact behavior is defined beside the command

Does it change anything?

This is intended to inspect or validate state rather than change it.

Is it safe to rerun?

Normally safe to rerun because it is observational, but still confirm the execution location first.

What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

Do not continue unless:

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

Common mistake:

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

Exact recovery:

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

What you just accomplished:

You executed and checked one controlled operation rather than treating a long script as a black box.

How this connects to the project:

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 9 lesson index](#)

Action 9.5.G3 — Inspect all current Git changes

Application:

Windows PowerShell or the VS Code PowerShell terminal

Window or panel:

VS Code integrated PowerShell terminal

Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

Exact physical actions:

1. CLICK: Bring **Windows PowerShell or the VS Code PowerShell terminal** to the front.
2. LOOK FOR: Confirm the current location matches The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

Command or code (PowerShell):

```
git status --short
```

Where to enter it:

VS Code integrated PowerShell terminal. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

What each part means:

- **Line 1:** `git status --short` — `git` calls the Git version-control program; `status` shows tracked, staged, modified, and untracked work; `--short` is a command option or flag; its exact behavior is defined beside the command

Does it change anything?

This is intended to inspect or validate state rather than change it.

Is it safe to rerun?

Normally safe to rerun because it is observational, but still confirm the execution location first.

What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

Do not continue unless:

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

Common mistake:

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

Exact recovery:

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

What you just accomplished:

You executed and checked one controlled operation rather than treating a long script as a black box.

How this connects to the project:

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 9 lesson index](#)

Interpret git status --short

- ?? means untracked: Git sees a new path but it is not staged.
- M means modified in the working tree but not staged.
- M means the staged version differs from the last commit.
- MM means a staged version exists and the file has additional unstaged edits.
- A means staged as a new file.
- D means deletion; stop and investigate unless deletion is deliberate.
- R means rename; inspect both old and new paths.
- A blank result means the working tree is clean. It does not prove database, Databricks, or Power BI work occurred.

Action 9.5.G4 — Inspect the unstaged diff for databricks/notebooks/ 01_bronze_sqlserver.py

Application:

Databricks workspace in a web browser

Window or panel:

VS Code integrated PowerShell terminal

Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

Exact physical actions:

1. CLICK: Bring **Databricks workspace in a web browser** to the front.
2. LOOK FOR: Confirm the current location matches The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

Command or code (PowerShell):

```
git diff -- "databricks/notebooks/01_bronze_sqlserver.py"
```

Where to enter it:

VS Code integrated PowerShell terminal. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

What each part means:

- **Line 1:** `git diff -- "databricks/notebooks/01_bronze_sqlserver.py"` — `git` calls the Git version-control program; `diff` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `--` is a command option or flag; its exact behavior is defined beside the command; `"databricks/notebooks/01_bronze_sqlserver.py"` is a path, relative location, branch-style name, or file argument; verify every character before running it

Does it change anything?

This is intended to inspect or validate state rather than change it.

Is it safe to rerun?

Normally safe to rerun because it is observational, but still confirm the execution location first.

What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

Do not continue unless:

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

Common mistake:

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

Exact recovery:

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

What you just accomplished:

You executed and checked one controlled operation rather than treating a long script as a black box.

How this connects to the project:

This verified state becomes a dependable input to the next Northstar Retail construction action.

Action 9.5.G5 — Stage only the reviewed file databricks/notebooks/01_bronze_sqlserver.py

Application:

Databricks workspace in a web browser

Window or panel:

VS Code integrated PowerShell terminal

Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

Exact physical actions:

1. CLICK: Bring **Databricks workspace in a web browser** to the front.
2. LOOK FOR: Confirm the current location matches The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

Command or code (PowerShell):

```
git add -- "databricks/notebooks/01_bronze_sqlserver.py"
```

Where to enter it:

VS Code integrated PowerShell terminal. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

What each part means:

- **Line 1:** `git add -- "databricks/notebooks/01_bronze_sqlserver.py"` — `git` calls the Git version-control program; `add` moves selected changes into the staging area; `--` is a command option or flag; its exact behavior is defined beside the command; `"databricks/notebooks/01_bronze_sqlserver.py"` is a path, relative location, branch-style name, or file argument; verify every character before running it

Does it change anything?

This can change files, Git state, packages, database objects, or data.

Is it safe to rerun?

Safe to rerun only after reading the idempotency note and confirming that the same batch, file, or object will not be duplicated.

What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

Do not continue unless:

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 9 lesson index](#)

Action 9.5.G7 — Create the Phase 9 commit

Application:

Windows PowerShell or the VS Code PowerShell terminal

Window or panel:

VS Code integrated PowerShell terminal

Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

Exact physical actions:

1. CLICK: Bring **Windows PowerShell or the VS Code PowerShell terminal** to the front.
2. LOOK FOR: Confirm the current location matches The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

Command or code (PowerShell):

```
git commit -m "feat: ingest source batches into bronze"
```

Where to enter it:

VS Code integrated PowerShell terminal. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

What each part means:

- **Line 1:** `git commit -m "feat: ingest source batches into bronze"` — `git` calls the Git version-control program; `commit` records the staged snapshot; `-m` asks Python to run an installed module; `"feat: ingest source batches into bronze"` is a quoted literal; the quotation marks preserve spaces or mark text

Does it change anything?

This can change files, Git state, packages, database objects, or data.

Is it safe to rerun?

Safe to rerun only after reading the idempotency note and confirming that the same batch, file, or object will not be duplicated.

What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

Do not continue unless:

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

Common mistake:

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

Exact recovery:

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

What you just accomplished:

You executed and checked one controlled operation rather than treating a long script as a black box.

How this connects to the project:

This verified state becomes a dependable input to the next Northstar Retail construction action.

Action 9.5.G8 — Verify the new commit

Application:

Windows PowerShell or the VS Code PowerShell terminal

Window or panel:

VS Code integrated PowerShell terminal

Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

Exact physical actions:

1. CLICK: Bring **Windows PowerShell or the VS Code PowerShell terminal** to the front.
2. LOOK FOR: Confirm the current location matches The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

Command or code (PowerShell):

```
git log -1 --oneline --decorate
```

Where to enter it:

VS Code integrated PowerShell terminal. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

What each part means:

- **Line 1:** `git log -1 --oneline --decorate` — `git` calls the Git version-control program; `log` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `-1` is a command option or flag; its exact behavior is defined beside the command; `--oneline` is a command option or flag; its exact behavior is defined beside the command; `--decorate` is a command option or flag; its exact behavior is defined beside the command

Does it change anything?

This is intended to inspect or validate state rather than change it.

Is it safe to rerun?

Normally safe to rerun because it is observational, but still confirm the execution location first.

What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

Do not continue unless:

Action 9.5.G9 — Push the feature branch and set upstream

Application:

Windows PowerShell or the VS Code PowerShell terminal

Window or panel:

VS Code integrated PowerShell terminal

Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

Exact physical actions:

1. CLICK: Bring **Windows PowerShell or the VS Code PowerShell terminal** to the front.
2. LOOK FOR: Confirm the current location matches The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

Command or code (PowerShell):

```
git push -u origin "$(git branch --show-current)"
```

Where to enter it:

VS Code integrated PowerShell terminal. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

What each part means:

- **Line 1:** `git push -u origin "$(git branch --show-current)"` — `git` calls the Git version-control program; `push` sends local commits to a remote repository; `-u` is a command option or flag; its exact behavior is defined beside the command; `origin` the conventional name of the GitHub remote; `"$(git branch --show-current)"` is a quoted literal; the quotation marks preserve spaces or mark text

Does it change anything?

This can change files, Git state, packages, database objects, or data.

Is it safe to rerun?

Safe to rerun only after reading the idempotency note and confirming that the same batch, file, or object will not be duplicated.

What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row

count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

Do not continue unless:

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

Common mistake:

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

Exact recovery:

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

What you just accomplished:

You executed and checked one controlled operation rather than treating a long script as a black box.

How this connects to the project:

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 9 lesson index](#)

Verify on GitHub

1. CLICK: Open the repository page in a browser.
2. CLICK: Open the branch selector above the file list.
3. TYPE THIS: The exact branch name returned locally.
4. CLICK: Select that branch.
5. LOOK FOR: The latest commit message `feat: ingest source batches into bronze` and the intended changed paths.
6. CLICK: Open each changed file and confirm the GitHub version matches the staged diff.
7. Do not merge solely because the push succeeded; CI and review must pass.

Push-rejected recovery

If Git says the remote contains work you do not have, do not use `--force`. Run `git fetch origin`, inspect `git log --oneline --graph --decorate --all -20`, then rebase or merge only after understanding the divergence. Resolve conflicts one file at a time, run tests again, and push normally. A rejection protects remote work; it is not permission to overwrite it.

Explain it in your own words

Without copying the model answer, explain:

1. What you created or configured in Phase 9.
2. Why it exists.
3. Where it is located on your computer, in a database, in Databricks, in Power BI, or on GitHub.
4. What information enters it.
5. What information leaves it.
6. How it connects to the next phase.
7. How you verified it.
8. What could cause it to fail.
9. Which decision/tradeoff you could defend in an interview.

My answer

[WRITE YOUR ANSWER BEFORE READING THE REFERENCE]

OPTIONAL REFERENCE ANSWER — PHASE 9 TEACH-BACK MODEL

Read this only after completing **MY TASK** and using the three hints in order. The model is a learning reference, not evidence of your execution.

"Phase 9 created the verified boundary described by **Build the Bronze ingestion layer**. It consumes only the outputs accepted from earlier phases, produces a named and auditable handoff, and records enough metadata and tests to detect wrong context, missing data, duplicates, failed rules, or unsafe reruns. I verified the result in its owning application and connected the evidence to Git without claiming that displayed instructions were executed."

Mini quiz

1. Multiple choice: Why does Phase 9 occur at this point in the source-to-consumption chain? A) Because menu order is arbitrary. B) Because its verified upstream input now exists. C) Because later phases do not depend on it. D) To create portfolio screenshots before validation.
 2. True or false: A command that displays no error is automatically verified even when it ran in the wrong folder, database, catalog, schema, branch, or filter context.
 3. Fill in the blank: The statement that defines what one row represents is the table or entity _____.
 4. What command would you use first to confirm the PowerShell current folder before a repository command?
 5. Troubleshooting: Your output differs from the example. What should you check before deleting, overwriting, resetting, force-pushing, or weakening a test?
 6. Design choice: Explain one tradeoff of Track A and one production alternative.
 7. Code reading: Why are input, accepted, rejected, and deduplicated counts recorded separately?
 8. Ownership: Which status may you select only after personally performing and inspecting the verification?
-

Mini quiz answer key and explanations

1. **B.** This phase is ordered after its prerequisites so its output has a trustworthy input. A is wrong because order is intentional; C is wrong because later phases depend on the handoff; D is wrong because screenshots follow verification.
2. **False.** Lack of an error proves only that the application accepted something; context and independent verification still matter.
3. **Grain.** Grain is the precise meaning of one row. A key identifies a row, but it does not by itself state the row's business meaning.
4. **Get-Location.** It shows the shell's current folder. `git rev-parse --show-toplevel` separately verifies the repository root when inside a clone.
5. Check application, folder/path, branch, server/database, catalog/schema, batch ID, parameters, source/target grain, filter context, version/tier differences, and the first meaningful error. Destructive changes are not a diagnostic step.
6. Track A has manual upload/download boundaries and batch latency. A production alternative is routable private connectivity with cloud object storage/managed warehouse, identities, and automated orchestration.
7. Separate counts make every row outcome explainable. A single final count can hide silent drops, duplicates, or records that moved to quarantine.
8. **Verified by me / VERIFIED BY USER.** `PLANNED`, `CREATED BY USER`, and `RUN BY USER` describe earlier states; only inspected evidence supports verification.

[WRITE YOUR ANSWER]

What I learned:

[WRITE YOUR ANSWER]

What I can now explain without help:

[WRITE YOUR ANSWER]

What I still need to practice:

[WRITE YOUR ANSWER]

What your screen should look like now

- The phase output and final validation are saved or visible.
- The intended feature branch is still active.
- `git status` is either clean after the commit or lists only deliberately deferred work recorded in the journal.
- The branch exists on GitHub after a successful push.
- No database transaction, Databricks run, loader, test process, or Power BI refresh is still active.
- The next phase's required input is identifiable.

Lesson 9.5 completion checklist

☐

I completed the verification gate with my actual results — [STATUS]

☐

I recorded at least one realistic failure, alternate result, or diagnostic path — [STATUS]

☐

I captured and redacted the required screenshot only after verification — [STATUS]

☐

I reviewed, staged, committed, pushed, and verified only the intended Git changes — [STATUS]

☐

I completed the teach-back, quiz, answer review, and learning journal — [STATUS]

☐

I can name the exact verified handoff to the next phase — [STATUS]

Safe stopping point

All files must be saved. The terminal may be closed after the Git result is recorded. SSMS/pgAdmin may be closed after queries finish and transactions are committed/rolled back. Databricks compute may be stopped when no Job or notebook is running. Power BI may be closed after saving. Resume from the next phase's screen-start checklist and re-verify root, branch, connection, and latest accepted batch.

How this phase connects to the next phase

Phase 10 cleans, types, deduplicates, and quarantines Bronze records.

Phase 9 completion checklist

☐

Phase goal explained in my own words — [STATUS]

☐

Required files/objects created by me — [STATUS]

☐

Commands run by me — [STATUS]

Output independently inspected — [STATUS]

Failure/alternate branch understood — [STATUS]

Screenshot captured and redacted — [STATUS]

Targeted Git commit exists — [STATUS]

Branch pushed and verified on GitHub — [STATUS]

Quiz completed before answer key — [STATUS]

Journal completed — [STATUS]

Final phase status manually set — [] Not started / [-] In progress / [x] Verified by me / [!] Needs troubleshooting

[Back to the master table of contents](#)

Phase 10 — Build the Silver cleaning and conformance layer

[Back to the master table of contents](#)

Track: Track A required

Status when first opened: PLANNED

Completion rule: The phase is not complete because its instructions exist. Mark it VERIFIED BY USER only after you perform the work, inspect the output, and save evidence.

Why this phase happens now

Earlier work this phase depends on: Conformed Silver entities and explicit rejection rules.

What would go wrong if it happened earlier: You would create objects without a verified requirement, valid upstream input, protected repository state, or known execution environment.

Later work that depends on it: Phase 11 converts descriptive entities into durable dimensions.

Decision being made: Choose and verify the simplest local-first method that teaches the professional concept without pretending that local services are publicly reachable.

Alternatives: A company could use managed cloud databases, infrastructure as code, service principals, direct JDBC publication, deployment bundles, or streaming. Those options are discussed as tradeoffs, not substituted silently.

Beginner path selected: Track A: local SQL Server and PostgreSQL, Python batch extracts, manual governed upload to Databricks, Delta Bronze/Silver/Gold, manual verified export, local SQL Server warehouse, and Power BI Import.

Reason for the order: Requirements become source decisions; sources become generated data; source data becomes extraction batches; batches become Bronze; Bronze becomes Silver; Silver becomes Gold; Gold becomes warehouse and Power BI input.

Phase 10 lesson index

1. [Lesson 10.1 — Understand the phase and starting screen](#)
2. [Lesson 10.2 — Perform the notebook-guided actions one at a time](#)
3. [Lesson 10.3 — Create and understand the phase files](#)
4. [Lesson 10.4 — Build and validate required objects](#)
5. [Lesson 10.5 — Verify, troubleshoot, commit, teach back, and stop safely](#)

Lesson 10.1 — Understand the phase and starting screen

What your screen should look like before starting

- **Application open:** Databricks notebooks, Catalog Explorer, and SQL/Python cells.
- **Window in front:** The application named by the first action; do not keep an installer, database editor, notebook, and Power BI dialog stacked ambiguously.
- **Repository folder:** C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project when repository work is required. Verify User on your computer.
- **Git branch:** A feature branch, not a detached commit. Run `git branch --show-current` and record the exact result.
- **Database/workspace connection:** The connection named in the action, not merely the most recent connection.
- **Files that should already exist:** Only files from verified earlier phases. Do not pre-create the full tree.
- **Files that should not exist yet:** New Phase 10 files remain absent until their creation lesson.
- **Terminal prompt:** It should end in the expected repository path or another explicitly named folder.
- **Previous verification:** Phase 9 must be verified when this phase has a prerequisite.

Three-level explanation of the phase

Level 1 — Child-simple explanation

Imagine building a store from labeled boxes. This phase handles one box, checks that the label is correct, and makes sure the next box receives the right thing. You do not pour all boxes together and hope the result is understandable.

Level 2 — Northstar Retail project explanation

Phase 10 creates the specific Northstar Retail files, database objects, transformations, tests, model objects, or evidence described in the lessons. Every output keeps a visible connection to its source and batch so you can trace an order, customer, product, campaign, return, shipment, or inventory record.

Level 3 — Professional explanation

This phase establishes a controlled boundary in an end-to-end batch platform. It defines contracts, execution context, idempotency behavior, quality expectations, evidence, and handoff artifacts so the downstream layer can be reproduced and reviewed independently.

Applications to open

Databricks notebooks, Catalog Explorer, and SQL/Python cells. Open only the application needed for the immediate action. Extra windows increase the chance of typing a command into the wrong context.

Phase status gate

☐

I changed this phase from [] Not started to [-] In progress in the master tracker.

☐

I verified the repository root when repository work is required.

☐

I verified the current branch.

☐

I identified the exact server/database, Databricks workspace/catalog/schema, or Power BI file.

☐

I read the phase ordering explanation.

What your screen should look like now

- The Phase 10 lesson index, starting-screen checklist, and three explanation levels remain visible in this workbook.
- Only the applications required for the next lesson are open; no installer, database transaction, notebook run, or Power BI refresh was started merely to read orientation material.
- The intended repository path, active branch, server/database, Databricks workspace, or Power BI file has been written down when it applies.

- No new Phase 10 project file or object has been created yet unless the lesson explicitly instructed you to create it.
- The Phase 10 master-tracker row is marked [-] In progress only after you personally updated it.

Lesson 10.1 completion checklist

☐

I read why Phase 10 happens now — [STATUS]

☐

I can give the child-simple, Northstar-specific, and professional explanations — [STATUS]

☐

I identified the exact applications and execution context required next — [STATUS]

☐

I verified prerequisites instead of assuming they are complete — [STATUS]

☐

I updated the progress tracker myself — [STATUS]

Safe stopping point

No command, database transaction, Databricks run, loader, or Power BI refresh should be active after this orientation lesson. Save any journal note you created. You may close the workbook viewer and applications. When returning, reopen [Lesson 10.2](#), re-read its starting-screen checklist, and verify the repository root, branch, connection, and workspace before performing an action.

[Back to the Phase 10 lesson index](#)

Lesson 10.2 — Perform the notebook-guided actions one at a time

What your screen should look like before starting

The Phase 10 start gate is checked, only the needed application is in front, and the current context has been verified. The following retained lesson material preserves the Northstar terminology and exercise framing; the action cards then turn each hands-on step into a written screen-recording sequence.

Retained phase lesson, exercises, rules, and expected results

Track: Track A required

Ownership status at start: Workbook instructions exist; your execution is not yet verified.

Evidence rule: Replace placeholders only after the verification steps pass.

1. What you are building

Trusted-detail Silver tables for customers, products, sales, shipments, inventory, returns, promotions, web sessions/events, campaigns, and marketing spend, plus rule-specific quarantine tables and before/after quality evidence.

2. Why it matters

Silver is where source representations become governed data. It must distinguish correctable formatting differences from invalid business records, choose duplicate winners reproducibly, standardize time and currency assumptions, and preserve reject evidence so trusted counts can be explained.

3. Words to know

Term	Plain-language definition
Casting	Convert a value to a data type such as date, integer, decimal, timestamp.
Standardization	Represent equivalent values consistently, such as uppercase codes.
Validation	Test whether a value meets a rule.
Business key	Stable meaningful identifier used to deduplicate/conform.

Term	Plain-language definition
Window function	Calculation across related rows, used to rank duplicate candidates.
Conformed data	Shared representation across sources/domains.
UTC normalization	Convert timestamp instants to a common time zone.
Late-arriving record	Record received after expected time or related entity.
Change detection	Identify changed attributes, often with a hash.
MERGE	Transactional insert/update matching pattern.
Reject rule	Condition that keeps a row out of trusted output.
Quality flag	Non-blocking indicator retained for analysis.
Before/after example	Concrete raw value and resulting trusted/quarantine outcome.

4. What must already be completed

All Bronze tasks pass with manifest reconciliation and stable batch rerun. You know expected issue fixture counts. Silver notebooks 04–07 are available.

5. Applications to open

Application	How to open it	Why it is open
Databricks notebooks 04–07	Workspace Git folder/import.	Run domain transformations and inspect output.
Catalog Explorer / SQL editor	Silver and quality schemas.	Query trusted/quarantine tables.
VS Code	Open notebook source and SQL teaching patterns.	Read rules and complete TODO work.
Expected fixture	Uploaded/local JSON.	Compare configured defects with observed rules.

6. Exact click-by-click steps

Beginner rhythm: Read the whole step. Confirm the application and location. Perform only that step. Verify the visible result. Record an error before attempting a fix.

7. Exact commands, one code block at a time

8. Where each command runs

Never infer the execution location from the code language. The command headings above identify the application and folder/database/catalog. Before every PowerShell command, run `Get-Location`; before SQL, verify the selected database; before Spark, print the catalog/schema/batch widgets.

TEACHING EXAMPLE

The following small example or reference pattern explains the concept before you attempt Northstar-specific work. Read it, then complete **MY TASK** without copying the answer.

Line-by-line code explanation

Line or action	Meaning	Why it belongs here
<code>display(spark.table(f"{catalog}.{silver_schema}.customers").filter(F.col("batch_id") == batch_id).select("customer_number", "first_name", "email", "email_valid_flag", "state_code").limit(20))</code>	Shows standardized trusted customer fields/flags.	Validates correction and non-blocking flag behavior.
<code>SELECT quality_rule, COUNT(*) AS rejected_rows</code>	Counts customer rejects by rule.	Trusted output must explain exclusions.
<code>SELECT</code>	Summarizes typed valid sales.	Provides the independent pre-Gold revenue population.
<code>SELECT event_type, event_timestamp_utc, session_start_utc, out_of_order_flag</code>	Shows why events were rejected.	Time ordering is a business-quality rule, not a reader error.

Line or action	Meaning	Why it belongs here
bronze_count = spark.table(f"{catalog}.{bronze_schema}.erp_order_items").filter(F.col("_batch_id") == batch_id).count()	Reconciles sales line input to valid/reject outcomes.	No silent loss is allowed.

Tiny toy example

Input library rows: card A-1, name KIROLOS, email bad; another newer card A-1, name KIROLOS, valid email. Silver trims/title-cases, validates email, ranks by updated time, keeps the newer business-key winner, and quarantines the duplicate row. This teaches the pattern without revealing the final Northstar answer first.

Correct versus reject

Whitespace/case/date-format variations are usually correctable if unambiguous. Missing business key, impossible quantity, unreadable date, invalid relationship, or unsupported currency may require quarantine. A malformed email can be a quality flag rather than full-row rejection when sales analysis does not require sending email; document the policy.

MY TASK

Complete natural-key enrichment in `silver.sales`, add at least one Spark SQL equivalent to a PySpark rule, reconcile every Silver table to input/reject/dedup outcomes, and explain one correction-versus-quarantine decision.

STARTER SKELETON

```
# TODO(USER): enrich valid sales with natural business keys before Gold.
customer_keys = spark.table(f"{catalog}.{silver_schema}.customers").select(
    "customer_id", "customer_number"
)
product_keys = spark.table(f"{catalog}.{silver_schema}.products").select(
    "product_id", "sku"
)
store_keys = (spark.table(f"{catalog}.{bronze_schema}.erp_stores")
    .filter(F.col("_batch_id") == batch_id)
    .select("store_id", F.upper(F.trim("store_code")).alias("store_code")))

enriched = (sales
    .join(customer_keys, "customer_id", "left")
    .join(product_keys, "product_id", "left")
    .join(store_keys, "store_id", "left")
    # TODO(USER): employee_number and null/unknown policy.
)
# TODO(USER): test that required natural keys are non-null or intentionally UNKNOWN.
```

Acceptance criteria: Every trusted Silver table has declared grain and rules; input reconciles to valid/quarantine/dedup; timestamps/currency policy is consistent; sales carries natural keys for Gold lookup; rerun is stable.

HINT 1 — CONCEPT

Gold facts should join dimensions using natural/business keys and event date, not regex-extracted IDs.

HINT 2 — PSEUDOCODE

Build small lookup DataFrames from conformed/bronze parent tables, then left join and test null rates.

HINT 3 — NEAR-COMPLETE PATTERN

Use the near-complete skeleton and add employee/promotion/channel plus an explicit unknown policy.

13. Expected files or output

- Silver customers/products/sales/shipments/inventory/returns/promotions/web sessions/events/campaigns/spend.
- Quality quarantine tables with rule/batch/time.
- Natural-key enriched sales.
- Before/after examples.
- Layer reconciliation table.

14. How to verify

- Types are correct and codes standardized.
- No impossible quantities in trusted sales.
- UTC timestamps and event order are valid.
- Business-key duplicate winner is deterministic.
- Non-USD spend does not enter trusted Track A amounts.
- Input/valid/reject relationships are documented.

15. Automated tests

- Not-null/unique business keys.
- Accepted codes/currencies.
- Email validity flag counts.
- Date/numeric ranges.
- Referential integrity/natural-key availability.
- Same-batch replacement stability.
- Observed fixture count report.

16. Common errors and exact fixes

Message/symptom	Likely cause	Exact diagnostic	Safe fix	Verify
Cast produces null	Unexpected format or invalid value.	Filter source non-null where casted value null; display raw values.	Add explicit format/coalesce or quarantine; do not silently default.	No unexplained cast nulls.
Duplicate winner changes on rerun	Ranking order lacks deterministic tie-breaker.	Inspect equal updated_at rows/window order.	Add stable secondary key descending.	Same winner/hash each run.
Join multiplies rows	Lookup not unique at join key/grain.	Group lookup key HAVING count>1; compare counts before/after.	Deduplicate/conform lookup first; assert uniqueness.	Output count relationship expected.
Time zone shifted incorrectly	Timestamp already includes offset but conversion assumes local zone.	Inspect raw timestamp/parsed timezone.	Parse instant correctly; convert once to UTC; unit-test offsets.	Known instant aligns.
Quarantine duplicates on re-run	Append without batch replacement/unique grain.	Group by batch/rule/business key.	Delete/merge same batch before append.	Stable count.

For deeper tool-specific diagnosis, use [the troubleshooting index near the end of this workbook](#).

17. Explain it in your own words

1. What makes a formatting issue correctable but a quantity issue rejectable?
2. How does a deterministic window resolve duplicate business keys?
3. Why should Silver sales carry natural keys?
4. Why can injected issue counts differ from observed rule counts?

Write your answers in the learning-journal fields in this phase. Do not copy the wording above.

18. Mini quiz

1. Which layer should normalize timestamps to UTC?
2. What test detects a row-multiplying join?
3. Why might malformed email be a flag rather than a full-row reject?

Record your answers before opening the answer key.

19. Screenshot checkpoint

Capture a before/after customer example, sales quarantine count, digital event quarantine, and a reconciliation output proving no silent loss.

Save the image under docs/images/ with a descriptive filename. Check that no credential, token, password, or unnecessary personal account detail is visible.

20. Git checkpoint and suggested commit message

Run `git status`, review the Source Control diff in VS Code, stage only the intended files, then commit:

```
feat: build conformed silver tables and quality quarantines
```

Push the feature branch only after tests pass.

21. Completion checklist

Use one status per item: Not started, In progress, Verified by me, or Needs troubleshooting.

☐

Customer rules verified — [STATUS]

☐

Product/cost rules verified — [STATUS]

☐

Sales/return/shipping/inventory rules verified — [STATUS]

☐

Digital/marketing rules verified — [STATUS]

☐

Natural keys enriched — [STATUS]

☐

Quarantines reconciled — [STATUS]

☐

Same-batch rerun stable — [STATUS]

Attempt the task and record what failed before reading the optional reference answer in this phase: the optional reference-answer section later in this workbook#phase-10. The quiz answer is in the answer-key section immediately after the quiz in this workbook#phase-10.

Next phase: Phase 11 creates Gold dimensions, surrogate keys, unknown members, Type 1 corrections, and SCD Type 2 history.

Required action cards

Action 10.2.1 — Start with a toy example unrelated to Northstar: library patrons with ' KIR0LLO5 ', duplicate card number

Application:

Visual Studio Code

Window or panel:

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

Starting condition:

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Start with a toy example unrelated to Northstar: library patrons with ' KIR0LLO5 ', duplicate card number. This is one bounded construction or inspection task.

Why this action comes now:

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

Exact physical actions:

1. Bring the application named above to the front and confirm that no unrelated window has focus.
2. Read the starting condition and compare it with what is visible on your screen.
3. Perform only this immediate task: Start with a toy example unrelated to Northstar: library patrons with ' KIROLL0S ', duplicate card numbers, and invalid email. Decide what is corrected, flagged, or quarantined before reading final customer code.
4. Pause while the application finishes the operation; do not click the same control twice.
5. Inspect the visible result before changing another file, object, or setting.
6. Record the actual result in the verification field for this action.

Command or code:

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

Where to enter it:

Visual Studio Code. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

What each part means:**Step 1****Action**

Start with a toy example unrelated to Northstar: library patrons with ' KIROLL0S ', duplicate card numbers, and invalid email. Decide what is corrected, flagged, or quarantined before reading final customer code.

Before continuing☐

I used the application named in this phase.

☐

I confirmed the current folder/database/catalog/schema.

☐

I can describe what changed on the screen or filesystem.

☐

I know which later verification proves this step worked.

What should happen:

A visible file, folder, branch, connection, table, notebook, task, relationship, measure, visual, or verification result should appear exactly where the action predicts.

Expected example:

Your exact values may differ. The expected result is the same *type* of object and the same required status, not necessarily the same timestamps, row counts, colors, generated IDs, or screen dimensions.

What may look different:

Menu wording can vary by product release or account tier. Use the official-source register and look for the described object rather than guessing from an old screenshot.

How to verify success:

Reopen or refresh the relevant panel, locate the named object, and inspect the property or output that proves it exists and is in the intended location.

Do not continue unless:

You can point to the visible result and explain what it proves. Mark the action VERIFIED BY USER only after that check.

Common mistake:

Combining several clicks or decisions, choosing a similarly named object, or continuing because no error dialog appeared.

Exact recovery:

Stop at the current screen. Save a screenshot of the error if useful, hide sensitive values, and compare the selected location

with the starting condition. Use Back or Cancel rather than Delete or Overwrite. Correct one mismatch and repeat only this action.

What you just accomplished:

You completed one observable piece of the Northstar Retail platform and established a checkpoint that can be audited later.

How this connects to the project:

The resulting object, decision, or evidence becomes an input to the next stage in the source-to-consumption chain.

[Back to the Phase 10 lesson index](#)

Action 10.2.2 — Open 04_silver_customers. Trace trim/case/email validation/address join/window ranking/quarantine/batch repl

Application:

Visual Studio Code

Window or panel:

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

Starting condition:

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Open 04_silver_customers. Trace trim/case/email validation/address join/window ranking/quarantine/batch repl. This is one bounded construction or inspection task.

Why this action comes now:

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

Exact physical actions:

1. Bring the application named above to the front and confirm that no unrelated window has focus.
2. Read the starting condition and compare it with what is visible on your screen.
3. Perform only this immediate task: Open 04_silver_customers. Trace trim/case/email validation/address join/window ranking/quarantine/batch replacement. Note malformed email may be retained with email_valid_flag=false if business key is valid; duplicate/missing business key is quarantined.
4. Pause while the application finishes the operation; do not click the same control twice.
5. Inspect the visible result before changing another file, object, or setting.
6. Record the actual result in the verification field for this action.

Command or code:

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

Where to enter it:

Visual Studio Code. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

What each part means:

Step 2

Action

Open 04_silver_customers. Trace trim/case/email validation/address join/window ranking/quarantine/batch replacement. Note malformed email may be retained with email_valid_flag=false if business key is valid; duplicate/missing business key is quarantined.

Before continuing

☐

I used the application named in this phase.

☐

I confirmed the current folder/database/catalog/schema.

☐

I can describe what changed on the screen or filesystem.

☐

I know which later verification proves this step worked.

What should happen:

A visible file, folder, branch, connection, table, notebook, task, relationship, measure, visual, or verification result should appear exactly where the action predicts.

Expected example:

Your exact values may differ. The expected result is the same *type* of object and the same required status, not necessarily the same timestamps, row counts, colors, generated IDs, or screen dimensions.

What may look different:

Menu wording can vary by product release or account tier. Use the official-source register and look for the described object rather than guessing from an old screenshot.

How to verify success:

Reopen or refresh the relevant panel, locate the named object, and inspect the property or output that proves it exists and is in the intended location.

Do not continue unless:

You can point to the visible result and explain what it proves. Mark the action VERIFIED BY USER only after that check.

Common mistake:

Combining several clicks or decisions, choosing a similarly named object, or continuing because no error dialog appeared.

Exact recovery:

Stop at the current screen. Save a screenshot of the error if useful, hide sensitive values, and compare the selected location with the starting condition. Use Back or Cancel rather than Delete or Overwrite. Correct one mismatch and repeat only this action.

What you just accomplished:

You completed one observable piece of the Northstar Retail platform and established a checkpoint that can be audited later.

How this connects to the project:

The resulting object, decision, or evidence becomes an input to the next stage in the source-to-consumption chain.

[Back to the Phase 10 lesson index](#)

Action 10.2.3 — Run customer notebook and compare input = trusted + duplicate/missing-key quarantine under documented rule. Co

Application:

Databricks workspace in a web browser

Window or panel:

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

Starting condition:

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Run customer notebook and compare input = trusted + duplicate/missing-key quarantine under documented rule. Co. This is one bounded construction or inspection task.

Why this action comes now:

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

Exact physical actions:

1. Bring the application named above to the front and confirm that no unrelated window has focus.
2. Read the starting condition and compare it with what is visible on your screen.
3. Perform only this immediate task: Run customer notebook and compare input = trusted + duplicate/missing-key quarantine under documented rule. Count invalid-email flags separately because they may remain trusted for non-email analysis.
4. Pause while the application finishes the operation; do not click the same control twice.
5. Inspect the visible result before changing another file, object, or setting.
6. Record the actual result in the verification field for this action.

Command or code:

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

Where to enter it:

Databricks workspace in a web browser. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

What each part means:**Step 3****Action**

Run customer notebook and compare input = trusted + duplicate/missing-key quarantine under documented rule. Count invalid-email flags separately because they may remain trusted for non-email analysis.

Before continuing☐

I used the application named in this phase.

☐

I confirmed the current folder/database/catalog/schema.

☐

I can describe what changed on the screen or filesystem.

☐

I know which later verification proves this step worked.

What should happen:

A visible file, folder, branch, connection, table, notebook, task, relationship, measure, visual, or verification result should appear exactly where the action predicts.

Expected example:

Your exact values may differ. The expected result is the same *type* of object and the same required status, not necessarily the same timestamps, row counts, colors, generated IDs, or screen dimensions.

What may look different:

Menu wording can vary by product release or account tier. Use the official-source register and look for the described object rather than guessing from an old screenshot.

How to verify success:

Reopen or refresh the relevant panel, locate the named object, and inspect the property or output that proves it exists and is in the intended location.

Do not continue unless:

You can point to the visible result and explain what it proves. Mark the action VERIFIED BY USER only after that check.

Common mistake:

Combining several clicks or decisions, choosing a similarly named object, or continuing because no error dialog appeared.

Exact recovery:

Stop at the current screen. Save a screenshot of the error if useful, hide sensitive values, and compare the selected location with the starting condition. Use Back or Cancel rather than Delete or Overwrite. Correct one mismatch and repeat only this action.

What you just accomplished:

You completed one observable piece of the Northstar Retail platform and established a checkpoint that can be audited later.

How this connects to the project:

The resulting object, decision, or evidence becomes an input to the next stage in the source-to-consumption chain.

[Back to the Phase 10 lesson index](#)

Action 10.2.4 — Open/run 05_silver_products. Check SKU/category/supplier conformance and latest valid supplier cost by effective date

Application:

Visual Studio Code

Window or panel:

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

Starting condition:

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Open/run 05_silver_products. Check SKU/category/supplier conformance and latest valid supplier cost by effective date. This is one bounded construction or inspection task.

Why this action comes now:

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

Exact physical actions:

1. Bring the application named above to the front and confirm that no unrelated window has focus.
2. Read the starting condition and compare it with what is visible on your screen.
3. Perform only this immediate task: Open/run 05_silver_products. Check SKU/category/supplier conformance and latest valid supplier cost by effective date.
4. Pause while the application finishes the operation; do not click the same control twice.
5. Inspect the visible result before changing another file, object, or setting.
6. Record the actual result in the verification field for this action.

Command or code:

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

Where to enter it:

Visual Studio Code. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

What each part means:**Step 4****Action**

Open/run 05_silver_products. Check SKU/category/supplier conformance and latest valid supplier cost by effective date.

Before continuing☐

I used the application named in this phase.

☐

I confirmed the current folder/database/catalog/schema.

☐

I can describe what changed on the screen or filesystem.

☐

I know which later verification proves this step worked.

What should happen:

A visible file, folder, branch, connection, table, notebook, task, relationship, measure, visual, or verification result should appear exactly where the action predicts.

Expected example:

Your exact values may differ. The expected result is the same *type* of object and the same required status, not necessarily the same timestamps, row counts, colors, generated IDs, or screen dimensions.

What may look different:

Menu wording can vary by product release or account tier. Use the official-source register and look for the described object rather than guessing from an old screenshot.

How to verify success:

Reopen or refresh the relevant panel, locate the named object, and inspect the property or output that proves it exists and is in the intended location.

Do not continue unless:

You can point to the visible result and explain what it proves. Mark the action VERIFIED BY USER only after that check.

Common mistake:

Combining several clicks or decisions, choosing a similarly named object, or continuing because no error dialog appeared.

Exact recovery:

Stop at the current screen. Save a screenshot of the error if useful, hide sensitive values, and compare the selected location with the starting condition. Use Back or Cancel rather than Delete or Overwrite. Correct one mismatch and repeat only this action.

What you just accomplished:

You completed one observable piece of the Northstar Retail platform and established a checkpoint that can be audited later.

How this connects to the project:

How this connects to the project:

The resulting object, decision, or evidence becomes an input to the next stage in the source-to-consumption chain.

[Back to the Phase 10 lesson index](#)

Action 10.2.C1 — Databricks notebook cell

Application:

Databricks workspace in a web browser

Window or panel:

Databricks notebook cell

Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Run one explained Python instruction and inspect its result before any next command is introduced.

Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

Exact physical actions:

1. CLICK: Bring **Databricks workspace in a web browser** to the front.
2. LOOK FOR: Confirm the current location matches The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

Command or code (Python):

```
display(spark.table(f"{catalog}.{silver_schema}.customers").filter(F.col("batch_id") == batch_id).select("customer_number","first_name","email","email_valid_flag","state_code").limit(20))
```

Where to enter it:

Databricks notebook cell. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

What each part means:

- **Line 1:** `display(spark.table(f"{catalog}.{silver_schema}.customers").filter(F.col("batch_id") == batch_id).select("customer_number","first_name","email","email_valid_flag","state_code").limit(20))` — `display` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `(` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `spark.table` is a name, keyword, argument, identifier, or literal whose project-specific role is

described in the surrounding explanation; (is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; f is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; "{catalog}.{silver_schema}.customers" is a quoted literal; the quotation marks preserve spaces or mark text;) . is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; filter is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; (is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; F.col is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; (is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; "batch_id" is a quoted literal; the quotation marks preserve spaces or mark text; remaining punctuation and identifiers continue the same statement.

Does it change anything?

This is intended to inspect or validate state rather than change it.

Is it safe to rerun?

Normally safe to rerun because it is observational, but still confirm the execution location first.

What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use Get-Location or Test-Path; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

Do not continue unless:

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

Common mistake:

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

Exact recovery:

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

What you just accomplished:

You executed and checked one controlled operation rather than treating a long script as a black box.

How this connects to the project:

This verified state becomes a dependable input to the next Northstar Retail construction action.

Action 10.2.C2 — Databricks SQL editor

Application:

Databricks workspace in a web browser

Window or panel:

Databricks SQL editor

Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Run one explained Sql instruction and inspect its result before any next command is introduced.

Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

Exact physical actions:

1. CLICK: Bring **Databricks workspace in a web browser** to the front.
2. LOOK FOR: Confirm the current location matches The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

Command or code (Sql):

```
SELECT quality_rule, COUNT(*) AS rejected_rows
FROM northstar_retail.quality.customer_quarantine
WHERE batch_id = 'EXT-YYYYMMDDTHHMMSSZ'
GROUP BY quality_rule;
```

Where to enter it:

Databricks SQL editor. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

What each part means:

- **Line 1:** `SELECT quality_rule, COUNT(*) AS rejected_rows` — `SELECT` requests data without changing it unless combined with a modifying statement; `quality_rule` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `,` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `COUNT` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `(*)` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `AS` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `rejected_rows` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation
- **Line 2:** `FROM northstar_retail.quality.customer_quarantine` — `FROM` identifies the source table or query; `northstar_retail.quality.customer_quarantine` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation
- **Line 3:** `WHERE batch_id = 'EXT-YYYYMMDDTHHMMSSZ'` — `WHERE` filters rows to those meeting a condition; `batch_id` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `=` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `'EXT-YYYYMMDDTHHMMSSZ'` is a quoted literal; the quotation marks preserve spaces or mark text
- **Line 4:** `GROUP BY quality_rule;` — `GROUP` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `BY` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `quality_rule` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation

Does it change anything?

This is intended to inspect or validate state rather than change it.

Is it safe to rerun?

Normally safe to rerun because it is observational, but still confirm the execution location first.

What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

Do not continue unless:

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

Common mistake:

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

Exact recovery:

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

What you just accomplished:

You executed and checked one controlled operation rather than treating a long script as a black box.

How this connects to the project:

This verified state becomes a dependable input to the next Northstar Retail construction action.

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

Do not continue unless:

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

Common mistake:

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

Exact recovery:

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

What you just accomplished:

You executed and checked one controlled operation rather than treating a long script as a black box.

How this connects to the project:

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 10 lesson index](#)

What your screen should look like now

Each action you actually performed has a visible result and a recorded ownership status. You have not marked unrun reference commands as complete. The branch, connection, batch, and application context remain known.

Lesson 10.2 completion checklist

☐

I performed actions in order — [STATUS]

☐

I verified each command location — [STATUS]

☐

I distinguished typed text from observed output — [STATUS]

☐

I recorded differences caused by versions/tier — [STATUS]

☐

I stopped at the first unexplained error — [STATUS]

Safe stopping point

Save open work and record the next action number. Close an application only after its operation is complete. On return, re-open the Phase 10 starting-screen checklist and re-verify the active context.

Lesson 10.3 — Create and understand the phase files

What your screen should look like before starting

VS Code Explorer shows the repository root, the intended feature branch is active, and no Phase 10 file is assumed to exist merely because a reference answer appears below. Create each folder only when its first file is needed.

Folder introduction — databricks/

Exact folder name: databricks

Exact parent: repository root

Why it is needed now: Phase 10 is about to place its first responsibility-specific file here; creating it earlier would have produced an unexplained empty structure.

What will eventually be inside: Only files whose purpose matches this folder's name.

Why another folder is not appropriate: Separation keeps source SQL, transformations, tests, configuration, documentation, and generated artifacts reviewable.

Naming rules: Preserve lowercase/uppercase exactly as shown. Hyphens, underscores, spaces, and plural forms create different paths. This project avoids spaces in technical folder names.

VS Code method

1. CLICK: Open Explorer in VS Code.
2. LOOK FOR: Confirm the repository root is the top folder.
3. Expand the parent path repository root one level at a time.
4. RIGHT-CLICK: Right-click the immediate parent folder.
5. CLICK: **New Folder**.

6. TYPE THIS: databricks.
7. PRESS: Enter.
8. LOOK FOR: The folder appears once, at the correct indentation level.

PowerShell method

Action 10.D1.1 — Create the folder databricks

Application:

Databricks workspace in a web browser

Window or panel:

VS Code integrated PowerShell terminal at the repository root

Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

Exact physical actions:

1. CLICK: Bring **Databricks workspace in a web browser** to the front.
2. LOOK FOR: Confirm the current location matches The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

Command or code (PowerShell):

```
New-Item -ItemType Directory -Path ".\databricks" -ErrorAction Stop
```

Where to enter it:

VS Code integrated PowerShell terminal at the repository root. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

What each part means:

- **Line 1:** `New-Item -ItemType Directory -Path ".\databricks" -ErrorAction Stop` — `New-Item` creates a file or folder; `-ItemType` is a command option or flag; its exact behavior is defined beside the command; `Directory` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `-Path` is a command option or flag; its exact behavior is defined beside the command; `".\databricks"` is a path, relative location, branch-style name, or file argument; verify every character before running it; `-ErrorAction` is a command option or flag; its exact behavior is defined beside the command; `Stop` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation

Does it change anything?

This can change files, Git state, packages, database objects, or data.

Is it safe to rerun?

Safe to rerun only after reading the idempotency note and confirming that the same batch, file, or object will not be duplicated.

What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

Do not continue unless:

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

Common mistake:

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

Exact recovery:

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

What you just accomplished:

You executed and checked one controlled operation rather than treating a long script as a black box.

How this connects to the project:

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 10 lesson index](#)

Folder-creation decision branches**If the folder is created**

Run `Test-Path -LiteralPath ".\databricks" -PathType Container` and require `True`.

If PowerShell says the folder already exists

Do not delete or recreate it. Run `Get-ChildItem -LiteralPath ".\databricks" -Force`, inspect its existing files, and preserve them. Continue only when the existing folder is the intended path.

If the parent path does not exist

Return to the parent-folder tutorial. Create and verify one parent level at a time; do not create the entire future tree in one command.

Verify the folder

1. Run `Test-Path ".\databricks" -PathType Container`.
2. Require the output `True` before creating a child file.
3. Remember: Git does not track an empty folder by itself; the folder becomes visible in Git history when a tracked file is added.

Folder introduction — sql/

Exact folder name: `sql`

Exact parent: repository root

Why it is needed now: Phase 10 is about to place its first responsibility-specific file here; creating it earlier would have produced an unexplained empty structure.

What will eventually be inside: Only files whose purpose matches this folder's name.

Why another folder is not appropriate: Separation keeps source SQL, transformations, tests, configuration, documentation, and generated artifacts reviewable.

Naming rules: Preserve lowercase/uppercase exactly as shown. Hyphens, underscores, spaces, and plural forms create different paths. This project avoids spaces in technical folder names.

VS Code method

1. CLICK: Open Explorer in VS Code.
2. LOOK FOR: Confirm the repository root is the top folder.
3. Expand the parent path repository root one level at a time.
4. RIGHT-CLICK: Right-click the immediate parent folder.
5. CLICK: **New Folder**.
6. TYPE THIS: `sql`.
7. PRESS: Enter.
8. LOOK FOR: The folder appears once, at the correct indentation level.

PowerShell method

Action 10.D2.1 — Create the folder `sql`

Application:

Windows PowerShell or the VS Code PowerShell terminal

Window or panel:

VS Code integrated PowerShell terminal at the repository root

Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

4. RIGHT-CLICK: Right-click the immediate parent folder.
5. CLICK: **New Folder**.
6. TYPE THIS: silver.
7. PRESS: Enter.
8. LOOK FOR: The folder appears once, at the correct indentation level.

PowerShell method

Action 10.D5.1 — Create the folder sql/databricks/silver

Application:

Databricks workspace in a web browser

Window or panel:

VS Code integrated PowerShell terminal at the repository root

Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

Exact physical actions:

1. CLICK: Bring **Databricks workspace in a web browser** to the front.
2. LOOK FOR: Confirm the current location matches The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

Command or code (PowerShell):

```
New-Item -ItemType Directory -Path ".\sql\databricks\silver" -ErrorAction Stop
```

Where to enter it:

VS Code integrated PowerShell terminal at the repository root. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

What each part means:

- **Line 1:** `New-Item -ItemType Directory -Path ".\sql\databricks\silver" -ErrorAction Stop` — `New-Item` creates a file or folder; `-ItemType` is a command option or flag; its exact behavior is defined beside the command; `Directory` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `-Path` is a command option or flag; its exact behavior is defined beside the command; `.\sql\databricks\silver` is a path, relative location, branch-style name, or file argument; verify every character before running it; `-ErrorAction` is a command option or flag; its exact behavior is defined beside the command; `Stop` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation

Does it change anything?

This can change files, Git state, packages, database objects, or data.

Is it safe to rerun?

Safe to rerun only after reading the idempotency note and confirming that the same batch, file, or object will not be duplicated.

What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

Do not continue unless:

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

Common mistake:

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

Exact recovery:

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

What you just accomplished:

You executed and checked one controlled operation rather than treating a long script as a black box.

How this connects to the project:

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 10 lesson index](#)

Folder-creation decision branches**If the folder is created**

Run `Test-Path -LiteralPath ".\sql\databricks\silver" -PathType Container` and require `True`.

If PowerShell says the folder already exists

Do not delete or recreate it. Run `Get-ChildItem -LiteralPath ".\sql\databricks\silver" -Force`, inspect its existing files, and preserve them. Continue only when the existing folder is the intended path.

If the parent path does not exist

Return to the parent-folder tutorial. Create and verify one parent level at a time; do not create the entire future tree in one command.

Verify the folder

1. Run `Test-Path ".\sql\databricks\silver" -PathType Container`.
2. Require the output `True` before creating a child file.
3. Remember: Git does not track an empty folder by itself; the folder becomes visible in Git history when a tracked file is added.

File introduction — databricks/notebooks/04_silver_customers.py

Exact filename: `04_silver_customers.py`

Filename extension: `.py`. In this project it identifies executable Python logic and helps the correct application choose syntax highlighting or execution behavior.

Exact parent folder: `databricks/notebooks` relative to the repository root.

Why this file belongs there: Files with the same responsibility are grouped so a reviewer can find configuration, source SQL, transformations, tests, documentation, and report assets without guessing.

What the file will contain: executable Python logic for Phase 10.

Later dependencies: Later phase commands, tests, GitHub Actions, Databricks tasks, warehouse loads, Power BI work, or portfolio evidence may depend on its exact path.

Should Git track it? Yes, unless the lesson explicitly identifies it as generated data, a local secret, a log, or a machine-

specific artifact.

Could it contain secrets? It should not contain live passwords, tokens, connection strings, or account identifiers.

What happens if it is missing: The corresponding phase cannot be reproduced, validated, or explained from the repository alone.

VS Code click path

1. CLICK: In VS Code, open **Explorer** from the left Activity Bar.
2. LOOK FOR: Confirm the top-level folder name is SQL-Data-Warehouse-Project and the status bar shows the intended Git branch.
3. CLICK: Expand each parent folder in databricks/notebooks one level at a time.
4. If a parent folder does not exist, use the folder tutorial in this phase before creating the file.
5. RIGHT-CLICK: Right-click the immediate parent folder.
6. CLICK: Select **New File**.
7. TYPE THIS: 04_silver_customers.py.
8. PRESS: Enter.
9. LOOK FOR: A new editor tab labeled 04_silver_customers.py and an empty file under the correct parent folder.
10. PRESS: Ctrl+S after adding each explained section.

PowerShell path

Action 10.F1.1 — Create the file databricks/notebooks/04_silver_customers.py from PowerShell

Application:

Databricks workspace in a web browser

Window or panel:

VS Code integrated PowerShell terminal opened at the repository root

Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

Exact physical actions:

1. CLICK: Bring **Databricks workspace in a web browser** to the front.
2. LOOK FOR: Confirm the current location matches The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

Command or code (PowerShell):

```
New-Item -ItemType File -Path ".\databricks\notebooks\04_silver_customers.py" -ErrorAction Stop
```

Where to enter it:

VS Code integrated PowerShell terminal opened at the repository root. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

What each part means:

- **Line 1:** `New-Item -ItemType File -Path ".\databricks\notebooks\04_silver_customers.py" -ErrorAction Stop` — `New-Item` creates a file or folder; `-ItemType` is a command option or flag; its exact behavior is defined beside the command; `File` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `-Path` is a command option or flag; its exact behavior is defined beside the command; `".\databricks\notebooks\04_silver_customers.py"` is a path, relative location, branch-style name, or file argument; verify every character before running it; `-ErrorAction` is a command option or flag; its exact behavior is defined beside the command; `Stop` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation

Does it change anything?

This can change files, Git state, packages, database objects, or data.

Is it safe to rerun?

Safe to rerun only after reading the idempotency note and confirming that the same batch, file, or object will not be duplicated.

What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

Do not continue unless:

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

Common mistake:

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

Exact recovery:

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

What you just accomplished:

You executed and checked one controlled operation rather than treating a long script as a black box.

How this connects to the project:

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 10 lesson index](#)

File-creation decision branches**If the command creates the file**

Run `Test-Path -LiteralPath ".\databricks\notebooks\04_silver_customers.py" -PathType Leaf`. Continue only when it returns `True` and the file is empty because you just created it.

If PowerShell says the file already exists

Do not add -Force, do not clear the file, and do not overwrite it. Open the existing file in VS Code, run `git status --short -- "databricks/notebooks/04_silver_customers.py"`, inspect its contents and Git history, and decide whether this lesson should edit the preserved file rather than create a new one.

If PowerShell says part of the path does not exist

Stop. Create only the missing parent folder through the earlier folder tutorial, verify it with `Test-Path -PathType Container`, and rerun this one file command.

File-content construction

1. Start with the smallest header, comment, or first section shown in the phase lesson.
2. Read the purpose before typing the section.
3. Add one logical section at a time.
4. Save with Ctrl+S.
5. Run the syntax or content validation named in the phase.
6. Correct the first error before adding another section.
7. Use `TODO(USER)` where the workbook requires your own decision or verified value.

File verification

1. In the VS Code Explorer, confirm the file appears under `databricks/notebooks`.
2. Right-click the editor tab and choose **Copy Path**; compare the ending with `databricks/notebooks/04_silver_customers.py`.
3. In PowerShell at the repository root, run `Test-Path ".\databricks\notebooks\04_silver_customers.py"` and require `True`.
4. Run `git status --short -- "databricks/notebooks/04_silver_customers.py"` to see only this file's Git state.
5. Run the phase-specific validator before committing.

Optional reference answer for databricks/notebooks/04_silver_customers.py

Attempt the file construction first. This reference is learning material, not evidence that you created or ran the file.

Language: Python

Exact file: `databricks/notebooks/04_silver_customers.py`

Purpose: executable Python logic.

Inputs: The requirements, configuration, source data, or upstream objects described in Phase 10.

Expected outputs: The file's declared objects, logs, tables, checks, or documentation when the user later runs or reads it.

```
# Databricks notebook source
# Northstar Retail End-to-End Data Platform
# This file is a Git-friendly Databricks source notebook.
# Track A reads files that you manually uploaded to a Unity Catalog volume.
# It never attempts to reach SQL Server or PostgreSQL on localhost.

# COMMAND -----
# MAGIC %md
# MAGIC # 04 – Silver customers
# MAGIC Standardizes names and codes, validates email, chooses one business-key winner, and quarantines rejects.

# COMMAND -----

from __future__ import annotations

File introduction — databricks/notebooks/05_silver_products.py

Exact filename: 05_silver_products.py

Filename extension: .py. In this project it identifies executable Python logic and helps the correct application choose syntax highlighting or execution behavior.

Exact parent folder: databricks/notebooks relative to the repository root.

Why this file belongs there: Files with the same responsibility are grouped so a reviewer can find configuration, source SQL, transformations, tests, documentation, and report assets without guessing.

What the file will contain: executable Python logic for Phase 10.

Later dependencies: Later phase commands, tests, GitHub Actions, Databricks tasks, warehouse loads, Power BI work, or portfolio evidence may depend on its exact path.

Should Git track it? Yes, unless the lesson explicitly identifies it as generated data, a local secret, a log, or a machine-specific artifact.

Could it contain secrets? It should not contain live passwords, tokens, connection strings, or account identifiers.

What happens if it is missing: The corresponding phase cannot be reproduced, validated, or explained from the repository alone.

VS Code click path

1. CLICK: In VS Code, open **Explorer** from the left Activity Bar.
2. LOOK FOR: Confirm the top-level folder name is SQL-Data-Warehouse-Project and the status bar shows the intended Git branch.
3. CLICK: Expand each parent folder in databricks/notebooks one level at a time.
4. If a parent folder does not exist, use the folder tutorial in this phase before creating the file.
5. RIGHT-CLICK: Right-click the immediate parent folder.
6. CLICK: Select **New File**.
7. TYPE THIS: 05_silver_products.py.
8. PRESS: Enter.
9. LOOK FOR: A new editor tab labeled 05_silver_products.py and an empty file under the correct parent folder.
10. PRESS: Ctrl+S after adding each explained section.

PowerShell path

Action 10.F2.1 — Create the file databricks/notebooks/05_silver_products.py from PowerShell

Application:

Databricks workspace in a web browser

Window or panel:

VS Code integrated PowerShell terminal opened at the repository root

Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

Exact physical actions:

1. CLICK: Bring **Databricks workspace in a web browser** to the front.
2. LOOK FOR: Confirm the current location matches The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

Command or code (PowerShell):

```
New-Item -ItemType File -Path ".\databricks\notebooks\05_silver_products.py" -ErrorAction Stop
```

Where to enter it:

VS Code integrated PowerShell terminal opened at the repository root. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

What each part means:

- **Line 1:** `New-Item -ItemType File -Path ".\databricks\notebooks\05_silver_products.py" -ErrorAction Stop` — `New-Item` creates a file or folder; `-ItemType` is a command option or flag; its exact behavior is defined beside the command; `File` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `-Path` is a command option or flag; its exact behavior is defined beside the command; `".\databricks\notebooks\05_silver_products.py"` is a path, relative location, branch-style name, or file argument; verify every character before running it; `-ErrorAction` is a command option or flag; its exact behavior is defined beside the command; `Stop` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation

Does it change anything?

This can change files, Git state, packages, database objects, or data.

Is it safe to rerun?

Safe to rerun only after reading the idempotency note and confirming that the same batch, file, or object will not be duplicated.

What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

Do not continue unless:

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

Common mistake:

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

Exact recovery:

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

What you just accomplished:

You executed and checked one controlled operation rather than treating a long script as a black box.

How this connects to the project:

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 10 lesson index](#)

File-creation decision branches**If the command creates the file**

Run `Test-Path -LiteralPath ".\databricks\notebooks\05_silver_products.py" -PathType Leaf`. Continue only when it returns True and the file is empty because you just created it.

If PowerShell says the file already exists

Do not add `-Force`, do not clear the file, and do not overwrite it. Open the existing file in VS Code, run `git status --short -- "databricks/notebooks/05_silver_products.py"`, inspect its contents and Git history, and decide whether this lesson should edit the preserved file rather than create a new one.

If PowerShell says part of the path does not exist

Stop. Create only the missing parent folder through the earlier folder tutorial, verify it with `Test-Path -PathType Container`, and rerun this one file command.

File-content construction

1. Start with the smallest header, comment, or first section shown in the phase lesson.
2. Read the purpose before typing the section.
3. Add one logical section at a time.
4. Save with `Ctrl+S`.
5. Run the syntax or content validation named in the phase.
6. Correct the first error before adding another section.
7. Use `TODO(USER)` where the workbook requires your own decision or verified value.

File verification

1. In the VS Code Explorer, confirm the file appears under `databricks/notebooks`.
2. Right-click the editor tab and choose **Copy Path**; compare the ending with `databricks/notebooks/05_silver_products.py`.
3. In PowerShell at the repository root, run `Test-Path ".\databricks\notebooks\05_silver_products.py"` and require True.
4. Run `git status --short -- "databricks/notebooks/05_silver_products.py"` to see only this file's Git state.
5. Run the phase-specific validator before committing.

Optional reference answer for databricks/notebooks/05_silver_products.py

Attempt the file construction first. This reference is learning material, not evidence that you created or ran the file.

Language: Python

Exact file: `databricks/notebooks/05_silver_products.py`

Purpose: executable Python logic.

Inputs: The requirements, configuration, source data, or upstream objects described in Phase 10.

Expected outputs: The file's declared objects, logs, tables, checks, or documentation when the user later runs or reads it.

```
# Databricks notebook source
# Northstar Retail End-to-End Data Platform
# This file is a Git-friendly Databricks source notebook.
# Track A reads files that you manually uploaded to a Unity Catalog volume.
# It never attempts to reach SQL Server or PostgreSQL on localhost.
```

```

File introduction — databricks/notebooks/06_silver_sales.py

Exact filename: 06_silver_sales.py

Filename extension: .py. In this project it identifies executable Python logic and helps the correct application choose syntax highlighting or execution behavior.

Exact parent folder: databricks/notebooks relative to the repository root.

Why this file belongs there: Files with the same responsibility are grouped so a reviewer can find configuration, source SQL, transformations, tests, documentation, and report assets without guessing.

What the file will contain: executable Python logic for Phase 10.

Later dependencies: Later phase commands, tests, GitHub Actions, Databricks tasks, warehouse loads, Power BI work, or portfolio evidence may depend on its exact path.

Should Git track it? Yes, unless the lesson explicitly identifies it as generated data, a local secret, a log, or a machine-specific artifact.

Could it contain secrets? It should not contain live passwords, tokens, connection strings, or account identifiers.

What happens if it is missing: The corresponding phase cannot be reproduced, validated, or explained from the repository alone.

VS Code click path

1. CLICK: In VS Code, open **Explorer** from the left Activity Bar.
2. LOOK FOR: Confirm the top-level folder name is SQL-Data-Warehouse-Project and the status bar shows the intended Git branch.
3. CLICK: Expand each parent folder in databricks/notebooks one level at a time.
4. If a parent folder does not exist, use the folder tutorial in this phase before creating the file.
5. RIGHT-CLICK: Right-click the immediate parent folder.
6. CLICK: Select **New File**.
7. TYPE THIS: 06_silver_sales.py.
8. PRESS: Enter.
9. LOOK FOR: A new editor tab labeled 06_silver_sales.py and an empty file under the correct parent folder.
10. PRESS: Ctrl+S after adding each explained section.

PowerShell path

Action 10.F3.1 — Create the file databricks/notebooks/06_silver_sales.py from PowerShell

Application:

Databricks workspace in a web browser

Window or panel:

VS Code integrated PowerShell terminal opened at the repository root

Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

Exact physical actions:

1. CLICK: Bring **Databricks workspace in a web browser** to the front.
2. LOOK FOR: Confirm the current location matches The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

Command or code (PowerShell):

```
New-Item -ItemType File -Path ".\databricks\notebooks\06_silver_sales.py" -ErrorAction Stop
```

Where to enter it:

VS Code integrated PowerShell terminal opened at the repository root. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

What each part means:

- **Line 1:** `New-Item -ItemType File -Path ".\databricks\notebooks\06_silver_sales.py" -ErrorAction Stop` — `New-Item` creates a file or folder; `-ItemType` is a command option or flag; its exact behavior is defined beside the command; `File` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `-Path` is a command option or flag; its exact behavior is defined beside the command; `".\databricks\notebooks\06_silver_sales.py"` is a path, relative location, branch-style name, or file argument; verify every character before running it; `-ErrorAction` is a command option or flag; its exact behavior is defined beside the command; `Stop` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation

Does it change anything?

This can change files, Git state, packages, database objects, or data.

Is it safe to rerun?

Safe to rerun only after reading the idempotency note and confirming that the same batch, file, or object will not be duplicated.

What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

Do not continue unless:

The result is visible, understandable, and recorded as RUN BY USER or VERIFIED BY USER. Displaying this workbook does not count as execution.

Common mistake:

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

Exact recovery:

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

What you just accomplished:

You executed and checked one controlled operation rather than treating a long script as a black box.

How this connects to the project:

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 10 lesson index](#)

File-creation decision branches**If the command creates the file**

Run `Test-Path -LiteralPath ".\databricks\notebooks\06_silver_sales.py" -PathType Leaf`. Continue only when it returns True and the file is empty because you just created it.

If PowerShell says the file already exists

Do not add `-Force`, do not clear the file, and do not overwrite it. Open the existing file in VS Code, run `git status --short -- "databricks/notebooks/06_silver_sales.py"`, inspect its contents and Git history, and decide whether this lesson should edit the preserved file rather than create a new one.

If PowerShell says part of the path does not exist

Stop. Create only the missing parent folder through the earlier folder tutorial, verify it with `Test-Path -PathType Container`, and rerun this one file command.

File-content construction

1. Start with the smallest header, comment, or first section shown in the phase lesson.
2. Read the purpose before typing the section.
3. Add one logical section at a time.
4. Save with Ctrl+S.
5. Run the syntax or content validation named in the phase.
6. Correct the first error before adding another section.
7. Use `TODO(USER)` where the workbook requires your own decision or verified value.

File verification

1. In the VS Code Explorer, confirm the file appears under `databricks/notebooks`.
2. Right-click the editor tab and choose **Copy Path**; compare the ending with `databricks/notebooks/06_silver_sales.py`.
3. In PowerShell at the repository root, run `Test-Path ".\databricks\notebooks\06_silver_sales.py"` and require True.
4. Run `git status --short -- "databricks/notebooks/06_silver_sales.py"` to see only this file's Git state.
5. Run the phase-specific validator before committing.

Optional reference answer for databricks/notebooks/06_silver_sales.py

Attempt the file construction first. This reference is learning material, not evidence that you created or ran the file.

Language: Python

Exact file: `databricks/notebooks/06_silver_sales.py`

Purpose: executable Python logic.

Inputs: The requirements, configuration, source data, or upstream objects described in Phase 10.

Expected outputs: The file's declared objects, logs, tables, checks, or documentation when the user later runs or reads it.

```
# Databricks notebook source
# Northstar Retail End-to-End Data Platform
```

```

# This file is a Git-friendly Databricks source notebook.
# Track A reads files that you manually uploaded to a Unity Catalog volume.
# It never attempts to reach SQL Server or PostgreSQL on localhost.

File introduction — databricks/notebooks/07_silver_digital.py

Exact filename: 07_silver_digital.py

Filename extension: .py. In this project it identifies executable Python logic and helps the correct application choose syntax highlighting or execution behavior.

Exact parent folder: databricks/notebooks relative to the repository root.

Why this file belongs there: Files with the same responsibility are grouped so a reviewer can find configuration, source SQL, transformations, tests, documentation, and report assets without guessing.

What the file will contain: executable Python logic for Phase 10.

Later dependencies: Later phase commands, tests, GitHub Actions, Databricks tasks, warehouse loads, Power BI work, or portfolio evidence may depend on its exact path.

Should Git track it? Yes, unless the lesson explicitly identifies it as generated data, a local secret, a log, or a machine-specific artifact.

Could it contain secrets? It should not contain live passwords, tokens, connection strings, or account identifiers.

What happens if it is missing: The corresponding phase cannot be reproduced, validated, or explained from the repository alone.

VS Code click path

1. CLICK: In VS Code, open **Explorer** from the left Activity Bar.
2. LOOK FOR: Confirm the top-level folder name is SQL-Data-Warehouse-Project and the status bar shows the intended Git branch.
3. CLICK: Expand each parent folder in databricks/notebooks one level at a time.
4. If a parent folder does not exist, use the folder tutorial in this phase before creating the file.
5. RIGHT-CLICK: Right-click the immediate parent folder.
6. CLICK: Select **New File**.
7. TYPE THIS: 07_silver_digital.py.
8. PRESS: Enter.
9. LOOK FOR: A new editor tab labeled 07_silver_digital.py and an empty file under the correct parent folder.
10. PRESS: Ctrl+S after adding each explained section.

PowerShell path

Action 10.F4.1 — Create the file databricks/notebooks/07_silver_digital.py from PowerShell

Application:

Databricks workspace in a web browser

Window or panel:

VS Code integrated PowerShell terminal opened at the repository root

Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

Exact physical actions:

1. CLICK: Bring **Databricks workspace in a web browser** to the front.

2. LOOK FOR: Confirm the current location matches The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

Command or code (PowerShell):

```
New-Item -ItemType File -Path ".\databricks\notebooks\07_silver_digital.py" -ErrorAction Stop
```

Where to enter it:

VS Code integrated PowerShell terminal opened at the repository root. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

What each part means:

- **Line 1:** `New-Item -ItemType File -Path ".\databricks\notebooks\07_silver_digital.py" -ErrorAction Stop` — `New-Item` creates a file or folder; `-ItemType` is a command option or flag; its exact behavior is defined beside the command; `File` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `-Path` is a command option or flag; its exact behavior is defined beside the command; `".\databricks\notebooks\07_silver_digital.py"` is a path, relative location, branch-style name, or file argument; verify every character before running it; `-ErrorAction` is a command option or flag; its exact behavior is defined beside the command; `Stop` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation

Does it change anything?

This can change files, Git state, packages, database objects, or data.

Is it safe to rerun?

Safe to rerun only after reading the idempotency note and confirming that the same batch, file, or object will not be duplicated.

What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

Do not continue unless:

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

Common mistake:

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

Exact recovery:

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

What you just accomplished:

You executed and checked one controlled operation rather than treating a long script as a black box.

How this connects to the project:

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 10 lesson index](#)

File-creation decision branches**If the command creates the file**

Run `Test-Path -LiteralPath ".\databricks\notebooks\07_silver_digital.py" -PathType Leaf`. Continue only when it returns True and the file is empty because you just created it.

If PowerShell says the file already exists

Do not add `-Force`, do not clear the file, and do not overwrite it. Open the existing file in VS Code, run `git status --short -- "databricks/notebooks/07_silver_digital.py"`, inspect its contents and Git history, and decide whether this lesson should edit the preserved file rather than create a new one.

If PowerShell says part of the path does not exist

Stop. Create only the missing parent folder through the earlier folder tutorial, verify it with `Test-Path -PathType Container`, and rerun this one file command.

File-content construction

1. Start with the smallest header, comment, or first section shown in the phase lesson.
2. Read the purpose before typing the section.
3. Add one logical section at a time.
4. Save with `Ctrl+S`.
5. Run the syntax or content validation named in the phase.
6. Correct the first error before adding another section.
7. Use `TODO(USER)` where the workbook requires your own decision or verified value.

File verification

1. In the VS Code Explorer, confirm the file appears under `databricks/notebooks`.
2. Right-click the editor tab and choose **Copy Path**; compare the ending with `databricks/notebooks/07_silver_digital.py`.
3. In PowerShell at the repository root, run `Test-Path ".\databricks\notebooks\07_silver_digital.py"` and require True.
4. Run `git status --short -- "databricks/notebooks/07_silver_digital.py"` to see only this file's Git state.
5. Run the phase-specific validator before committing.

Optional reference answer for databricks/notebooks/07_silver_digital.py

Attempt the file construction first. This reference is learning material, not evidence that you created or ran the file.

Language: Python

Exact file: `databricks/notebooks/07_silver_digital.py`

Purpose: executable Python logic.

Inputs: The requirements, configuration, source data, or upstream objects described in Phase 10.

Expected outputs: The file's declared objects, logs, tables, checks, or documentation when the user later runs or reads it.

```
# Databricks notebook source
# Northstar Retail End-to-End Data Platform
# This file is a Git-friendly Databricks source notebook.
# Track A reads files that you manually uploaded to a Unity Catalog volume.
# It never attempts to reach SQL Server or PostgreSQL on localhost.

[Back to the Phase 10 lesson index](#)

File introduction — `sql/databricks/silver/01_customer_quality_patterns.sql`

Exact filename: `01_customer_quality_patterns.sql`

Filename extension: `.sql`. In this project it identifies database or lakehouse definitions and queries and helps the correct application choose syntax highlighting or execution behavior.

Exact parent folder: `sql/databricks/silver` relative to the repository root.

Why this file belongs there: Files with the same responsibility are grouped so a reviewer can find configuration, source SQL, transformations, tests, documentation, and report assets without guessing.

What the file will contain: database or lakehouse definitions and queries for Phase 10.

Later dependencies: Later phase commands, tests, GitHub Actions, Databricks tasks, warehouse loads, Power BI work, or portfolio evidence may depend on its exact path.

Should Git track it? Yes, unless the lesson explicitly identifies it as generated data, a local secret, a log, or a machine-specific artifact.

Could it contain secrets? It should not contain live passwords, tokens, connection strings, or account identifiers.

What happens if it is missing: The corresponding phase cannot be reproduced, validated, or explained from the repository alone.

VS Code click path

1. CLICK: In VS Code, open **Explorer** from the left Activity Bar.
2. LOOK FOR: Confirm the top-level folder name is `SQL-Data-Warehouse-Project` and the status bar shows the intended Git branch.
3. CLICK: Expand each parent folder in `sql/databricks/silver` one level at a time.
4. If a parent folder does not exist, use the folder tutorial in this phase before creating the file.
5. RIGHT-CLICK: Right-click the immediate parent folder.
6. CLICK: Select **New File**.
7. TYPE THIS: `01_customer_quality_patterns.sql`.
8. PRESS: Enter.
9. LOOK FOR: A new editor tab labeled `01_customer_quality_patterns.sql` and an empty file under the correct parent folder.
10. PRESS: `Ctrl+S` after adding each explained section.

Action 10.F5.1 — Create the file `sql/databricks/silver/01_customer_quality_patterns.sql` from PowerShell

Application:

Databricks workspace in a web browser

Window or panel:

VS Code integrated PowerShell terminal opened at the repository root

Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

Exact physical actions:

1. CLICK: Bring **Databricks workspace in a web browser** to the front.
2. LOOK FOR: Confirm the current location matches The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

Command or code (PowerShell):

```
New-Item -ItemType File -Path ".\sql\databricks\silver\01_customer_quality_patterns.sql" -ErrorAction Stop
```

Where to enter it:

VS Code integrated PowerShell terminal opened at the repository root. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

What each part means:

- **Line 1:** `New-Item -ItemType File -Path ".\sql\databricks\silver\01_customer_quality_patterns.sql" -ErrorAction Stop` — `New-Item` creates a file or folder; `-ItemType` is a command option or flag; its exact behavior is defined beside the command; `File` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `-Path` is a command option or flag; its exact behavior is defined beside the command; `.\sql\databricks\silver\01_customer_quality_patterns.sql` is a path, relative location, branch-style name, or file argument; verify every character before running it; `-ErrorAction` is a command option or flag; its exact behavior is defined beside the command; `Stop` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation

Does it change anything?

This can change files, Git state, packages, database objects, or data.

Is it safe to rerun?

Safe to rerun only after reading the idempotency note and confirming that the same batch, file, or object will not be duplicated.

What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

Do not continue unless:

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

Common mistake:

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

Exact recovery:

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

What you just accomplished:

You executed and checked one controlled operation rather than treating a long script as a black box.

How this connects to the project:

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 10 lesson index](#)

File-creation decision branches**If the command creates the file**

Run `Test-Path -LiteralPath ".\sql\databricks\silver\01_customer_quality_patterns.sql" -PathType Leaf`. Continue only when it returns `True` and the file is empty because you just created it.

If PowerShell says the file already exists

Do not add `-Force`, do not clear the file, and do not overwrite it. Open the existing file in VS Code, run `git status --short -- "sql/databricks/silver/01_customer_quality_patterns.sql"`, inspect its contents and Git history, and decide whether this lesson should edit the preserved file rather than create a new one.

If PowerShell says part of the path does not exist

Stop. Create only the missing parent folder through the earlier folder tutorial, verify it with `Test-Path -PathType Container`, and rerun this one file command.

File-content construction

1. Start with the smallest header, comment, or first section shown in the phase lesson.
2. Read the purpose before typing the section.
3. Add one logical section at a time.
4. Save with `Ctrl+S`.
5. Run the syntax or content validation named in the phase.
6. Correct the first error before adding another section.
7. Use `TODO(USER)` where the workbook requires your own decision or verified value.

File verification

1. In the VS Code Explorer, confirm the file appears under `sql/databricks/silver`.

2. Right-click the editor tab and choose **Copy Path**; compare the ending with `sql/databricks/silver/01_customer_quality_patterns.sql`.
3. In PowerShell at the repository root, run `Test-Path ".\sql\databricks\silver\01_customer_quality_patterns.sql"` and require True.
4. Run `git status --short -- "sql/databricks/silver/01_customer_quality_patterns.sql"` to see only this file's Git state.
5. Run the phase-specific validator before committing.

Optional reference answer for `sql/databricks/silver/01_customer_quality_patterns.sql`

Attempt the file construction first. This reference is learning material, not evidence that you created or ran the file.

Language: SQL

Exact file: `sql/databricks/silver/01_customer_quality_patterns.sql`

Purpose: database or lakehouse definitions and queries.

Inputs: The requirements, configuration, source data, or upstream objects described in Phase 10.

Expected outputs: The file's declared objects, logs, tables, checks, or documentation when the user later runs or reads it.

```
-- Dialect: Databricks SQL / Spark SQL
-- Tiny teaching example: clean and rank duplicate business keys.
WITH cleaned AS (
  SELECT
    upper(trim(customer_number)) AS customer_number,
    initcap(trim(first_name)) AS first_name,
    lower(trim(email)) AS email,
    updated_at,
    row_number() OVER (
      PARTITION BY upper(trim(customer_number))
      ORDER BY updated_at DESC, customer_id DESC
    ) AS business_key_rank
  FROM IDENTIFIER(:bronze_customer_table)
)
SELECT * FROM cleaned WHERE business_key_rank = 1;
```

Line-by-line explanation

- **Line 1:** `-- Dialect: Databricks SQL / Spark SQL` is a comment for a human reader; it normally does not change data or execute business logic.
- **Line 2:** `-- Tiny teaching example: clean and rank duplicate business keys.` is a comment for a human reader; it normally does not change data or execute business logic.
- **Line 3:** `WITH cleaned AS (` — `WITH` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `cleaned` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `AS` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `(` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation
- **Line 4:** `SELECT` — `SELECT` requests data without changing it unless combined with a modifying statement
- **Line 5:** `upper(trim(customer_number)) AS customer_number,` — `upper` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `(` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `trim` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `(` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `customer_number` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `)` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `AS` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `customer_number` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `,` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation

project-specific role is described in the surrounding explanation; 1 is a numeric literal used by the command or expression

[Back to the Phase 10 lesson index](#)

File introduction — `sql/databricks/silver/02_sales_quality_patterns.sql`

Exact filename: `02_sales_quality_patterns.sql`

Filename extension: `.sql`. In this project it identifies database or lakehouse definitions and queries and helps the correct application choose syntax highlighting or execution behavior.

Exact parent folder: `sql/databricks/silver` relative to the repository root.

Why this file belongs there: Files with the same responsibility are grouped so a reviewer can find configuration, source SQL, transformations, tests, documentation, and report assets without guessing.

What the file will contain: database or lakehouse definitions and queries for Phase 10.

Later dependencies: Later phase commands, tests, GitHub Actions, Databricks tasks, warehouse loads, Power BI work, or portfolio evidence may depend on its exact path.

Should Git track it? Yes, unless the lesson explicitly identifies it as generated data, a local secret, a log, or a machine-specific artifact.

Could it contain secrets? It should not contain live passwords, tokens, connection strings, or account identifiers.

What happens if it is missing: The corresponding phase cannot be reproduced, validated, or explained from the repository alone.

VS Code click path

1. CLICK: In VS Code, open **Explorer** from the left Activity Bar.
2. LOOK FOR: Confirm the top-level folder name is `SQL-Data-Warehouse-Project` and the status bar shows the intended Git branch.
3. CLICK: Expand each parent folder in `sql/databricks/silver` one level at a time.
4. If a parent folder does not exist, use the folder tutorial in this phase before creating the file.
5. RIGHT-CLICK: Right-click the immediate parent folder.
6. CLICK: Select **New File**.
7. TYPE THIS: `02_sales_quality_patterns.sql`.
8. PRESS: Enter.
9. LOOK FOR: A new editor tab labeled `02_sales_quality_patterns.sql` and an empty file under the correct parent folder.
10. PRESS: Ctrl+S after adding each explained section.

PowerShell path

Action 10.F6.1 — Create the file `sql/databricks/silver/02_sales_quality_patterns.sql` from PowerShell

Application:

Databricks workspace in a web browser

Window or panel:

VS Code integrated PowerShell terminal opened at the repository root

Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

Exact physical actions:

1. CLICK: Bring **Databricks workspace in a web browser** to the front.

2. LOOK FOR: Confirm the current location matches The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

Command or code (PowerShell):

```
New-Item -ItemType File -Path ".\sql\databricks\silver\02_sales_quality_patterns.sql" -ErrorAction Stop
```

Where to enter it:

VS Code integrated PowerShell terminal opened at the repository root. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

What each part means:

- **Line 1:** `New-Item -ItemType File -Path ".\sql\databricks\silver\02_sales_quality_patterns.sql" -ErrorAction Stop` — `New-Item` creates a file or folder; `-ItemType` is a command option or flag; its exact behavior is defined beside the command; `File` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `-Path` is a command option or flag; its exact behavior is defined beside the command; `".\sql\databricks\silver\02_sales_quality_patterns.sql"` is a path, relative location, branch-style name, or file argument; verify every character before running it; `-ErrorAction` is a command option or flag; its exact behavior is defined beside the command; `Stop` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation

Does it change anything?

This can change files, Git state, packages, database objects, or data.

Is it safe to rerun?

Safe to rerun only after reading the idempotency note and confirming that the same batch, file, or object will not be duplicated.

What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

Do not continue unless:

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

Common mistake:

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

Exact recovery:

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

What you just accomplished:

You executed and checked one controlled operation rather than treating a long script as a black box.

How this connects to the project:

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 10 lesson index](#)

File-creation decision branches

If the command creates the file

Run `Test-Path -LiteralPath ".\sql\databricks\silver\02_sales_quality_patterns.sql" -PathType Leaf`. Continue only when it returns True and the file is empty because you just created it.

If PowerShell says the file already exists

Do not add `-Force`, do not clear the file, and do not overwrite it. Open the existing file in VS Code, run `git status --short -- "sql/databricks/silver/02_sales_quality_patterns.sql"`, inspect its contents and Git history, and decide whether this lesson should edit the preserved file rather than create a new one.

If PowerShell says part of the path does not exist

Stop. Create only the missing parent folder through the earlier folder tutorial, verify it with `Test-Path -PathType Container`, and rerun this one file command.

File-content construction

1. Start with the smallest header, comment, or first section shown in the phase lesson.
2. Read the purpose before typing the section.
3. Add one logical section at a time.
4. Save with `Ctrl+S`.
5. Run the syntax or content validation named in the phase.
6. Correct the first error before adding another section.
7. Use `TODO(USER)` where the workbook requires your own decision or verified value.

File verification

1. In the VS Code Explorer, confirm the file appears under `sql/databricks/silver`.
2. Right-click the editor tab and choose **Copy Path**; compare the ending with `sql/databricks/silver/02_sales_quality_patterns.sql`.
3. In PowerShell at the repository root, run `Test-Path ".\sql\databricks\silver\02_sales_quality_patterns.sql"` and require True.
4. Run `git status --short -- "sql/databricks/silver/02_sales_quality_patterns.sql"` to see only this file's Git state.
5. Run the phase-specific validator before committing.

Optional reference answer for `sql/databricks/silver/02_sales_quality_patterns.sql`

Attempt the file construction first. This reference is learning material, not evidence that you created or ran the file.

Language: SQL

Exact file: `sql/databricks/silver/02_sales_quality_patterns.sql`

Purpose: database or lakehouse definitions and queries.

Inputs: The requirements, configuration, source data, or upstream objects described in Phase 10.

Expected outputs: The file's declared objects, logs, tables, checks, or documentation when the user later runs or reads it.

```
-- Dialect: Databricks SQL / Spark SQL
SELECT
  order_item_id,
  CAST(quantity AS INT) AS quantity,
  CAST(unit_price AS DECIMAL(12,2)) AS unit_price,
  CAST(discount_amount AS DECIMAL(12,2)) AS discount_amount,
  CAST(quantity AS INT) * CAST(unit_price AS DECIMAL(12,2)) AS gross_sales_amount,
  CAST(quantity AS INT) * CAST(unit_price AS DECIMAL(12,2)) - CAST(discount_amount AS DECIMAL(12,2)) AS net_sales_amount
FROM IDENTIFIER(:bronze_order_item_table)
WHERE CAST(quantity AS INT) > 0;
```

Line-by-line explanation

- **Line 1:** `-- Dialect: Databricks SQL / Spark SQL` is a comment for a human reader; it normally does not change data or execute business logic.
- **Line 2:** `SELECT` — `SELECT` requests data without changing it unless combined with a modifying statement
- **Line 3:** `order_item_id,` — `order_item_id` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `,` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation

What your screen should look like now

- Every Phase 10 file you actually created appears under the correct parent folder.
- Your open editor tab matches the file you are validating.
- The Git branch has not changed unexpectedly.
- `git status --short` lists only expected work.
- Reference answers remain reference material; your status fields are not automatically completed.

Lesson 10.3 completion checklist

☐

`databricks/notebooks/04_silver_customers.py` was created by me, saved, located correctly, and inspected — [STATUS]

☐

`databricks/notebooks/05_silver_products.py` was created by me, saved, located correctly, and inspected — [STATUS]

☐

`databricks/notebooks/06_silver_sales.py` was created by me, saved, located correctly, and inspected — [STATUS]

☐

`databricks/notebooks/07_silver_digital.py` was created by me, saved, located correctly, and inspected — [STATUS]

☐

`sql/databricks/silver/01_customer_quality_patterns.sql` was created by me, saved, located correctly, and inspected — [STATUS]

☐

`sql/databricks/silver/02_sales_quality_patterns.sql` was created by me, saved, located correctly, and inspected — [STATUS]

Safe stopping point

Save every open file with Ctrl+S. You may close VS Code only after `git status --short` is recorded in your journal. The terminal may be closed when no installer, transaction, Python process, Databricks run, warehouse load, or Power BI refresh is active. Resume at [Lesson 10.4](#) and recheck the root and branch.

Lesson 10.4 — Build and validate required objects

What your screen should look like before starting

The phase files are saved, the correct application and connection are visible, and the upstream input has passed its verification gate. Build one object at a time; do not create many objects and inspect them only at the end.

Silver entity 1 — `silver.product_categories`

Bronze input: `bronze.erp_product_categories`.

Silver grain: One accepted, conformed record at the entity grain defined by the source-to-target mapping.

Cleaning responsibility: trim, cast, standardize, deduplicate, validate, and quarantine.

Rejected output: Entity-specific rejection/quarantine rows with `_batch_id`, business key when available, rule ID, reason, offending value, and rejection timestamp.

Business impact: Incorrect cleaning can duplicate revenue, misidentify customers, lose history, overstate inventory, misattribute marketing, or hide late shipments.

Action 10.4.SV1 — Build and test `silver.product_categories`

Application:

Databricks workspace in a web browser

Window or panel:

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

Starting condition:

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Build and test `silver.product_categories`. This is one bounded construction or inspection task.

Why this action comes now:

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

Exact physical actions:

1. CLICK: Open the Silver notebook responsible for `product_categories`.
2. LOOK FOR: Display a dirty Bronze example before writing a cleaning rule.
3. TYPE THIS: Add one explicit rule for the problem, including a rejection reason when the row is not accepted.
4. PRESS: Run the rule against the current batch only.
5. LOOK FOR: Display accepted and rejected examples side by side.
6. PRESS: Count Bronze input, Silver accepted, and rejected rows.
7. LOOK FOR: Require `input = accepted + rejected` unless the contract documents a separate deduplication accounting category.
8. PRESS: Run edge-case tests for null, whitespace, malformed date, duplicate business key, negative amount/quantity, and unknown reference as applicable.
9. DO NOT CONTINUE UNTIL: Counts reconcile and the expected dirty fixture produces the expected outcome.

Command or code:

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

Where to enter it:

Databricks workspace in a web browser. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

What each part means:

1. CLICK: Open the Silver notebook responsible for product_categories.
2. LOOK FOR: Display a dirty Bronze example before writing a cleaning rule.
3. TYPE THIS: Add one explicit rule for the problem, including a rejection reason when the row is not accepted.
4. PRESS: Run the rule against the current batch only.
5. LOOK FOR: Display accepted and rejected examples side by side.
6. PRESS: Count Bronze input, Silver accepted, and rejected rows.
7. LOOK FOR: Require input = accepted + rejected unless the contract documents a separate deduplication accounting category.
8. PRESS: Run edge-case tests for null, whitespace, malformed date, duplicate business key, negative amount/quantity, and unknown reference as applicable.
9. DO NOT CONTINUE UNTIL: Counts reconcile and the expected dirty fixture produces the expected outcome.

What should happen:

A visible file, folder, branch, connection, table, notebook, task, relationship, measure, visual, or verification result should appear exactly where the action predicts.

Expected example:

Your exact values may differ. The expected result is the same *type* of object and the same required status, not necessarily the same timestamps, row counts, colors, generated IDs, or screen dimensions.

What may look different:

Menu wording can vary by product release or account tier. Use the official-source register and look for the described object rather than guessing from an old screenshot.

How to verify success:

Reopen or refresh the relevant panel, locate the named object, and inspect the property or output that proves it exists and is in the intended location.

Do not continue unless:

You can point to the visible result and explain what it proves. Mark the action VERIFIED BY USER only after that check.

Common mistake:

Combining several clicks or decisions, choosing a similarly named object, or continuing because no error dialog appeared.

Exact recovery:

Stop at the current screen. Save a screenshot of the error if useful, hide sensitive values, and compare the selected location with the starting condition. Use Back or Cancel rather than Delete or Overwrite. Correct one mismatch and repeat only this action.

What you just accomplished:

You completed one observable piece of the Northstar Retail platform and established a checkpoint that can be audited later.

How this connects to the project:

The resulting object, decision, or evidence becomes an input to the next stage in the source-to-consumption chain.

[Back to the Phase 10 lesson index](#)

Dirty input → rule → expected outputs

Scenario	Dirty input example	Rule	Accepted output	Rejected output	Count expectation
Whitespace/case	padded or mixed-case code	trim and standardize governed code	normalized value	none when otherwise valid	one input becomes one accepted row
Invalid required value	null, malformed, or impossible value	validate business and type rule	none	original value plus reason	one input becomes one rejected row
Duplicate business key	two candidate rows	deterministic ordering and survivor rule	one survivor	duplicate/reconciliation record	input count remains explainable
Unknown reference	key absent from conformed parent	preserve for unknown-key handling or reject per contract	explicit unknown handling	monitored exception if policy requires	no silent row loss

Scenario	Dirty input example	Rule	Accepted output	Rejected output	Count expectation
Date boundary	end before start or impossible timestamp	compare parsed dates	corrected only when rule permits	otherwise reject	no coerced nonsense dates

Teaching code section

```
source_df = spark.table(f"{catalog}.bronze.erp_product_categories")
standardized_df = source_df.select(
    "*",
    F.trim(F.col(source_df.columns[0]).cast("string")).alias("_example_standardized_key")
)
valid_df = standardized_df.filter(F.col("_batch_id") == batch_id)
rejected_df = standardized_df.subtract(valid_df)
(valid_df.write.format("delta").mode("overwrite")
.option("replaceWhere", f"_batch_id = '{batch_id}'")
.saveAsTable(f"{catalog}.silver.product_categories"))
```

Line-by-line explanation

- **Line 1:** `source_df = spark.table(f"{catalog}.bronze.erp_product_categories")` — `source_df` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `=` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `spark.table` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `(` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `f` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `"{catalog}.bronze.erp_product_categories"` is a quoted literal; the quotation marks preserve spaces or mark text; `)` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation

Edge-case test worksheet

- Actual Bronze rows: [ENTER COUNT]
- Accepted Silver rows: [ENTER COUNT]
- Rejected rows: [ENTER COUNT]
- Deduplicated-but-accounted rows: [ENTER COUNT OR 0]
- Reconciliation equation: [WRITE THE EQUATION AND RESULT]
- Controlled dirty fixture observed: [YES/NO + RULE ID]
- Rerun result for same batch: [ENTER RESULT]

Common error and recovery

If a cast turns invalid text into null, do not filter nulls without recording them. Add a pre-cast raw column or parse-valid flag, write a rejection reason, reconcile counts, and rerun the batch-scoped partition. If a duplicate rule chooses different survivors across runs, add deterministic tie-break columns and test the ordering.

Interview-ready explanation

"I built `silver.product_categories` as a conformed entity with explicit acceptance and rejection rules. I demonstrated dirty input, validated edge cases, and reconciled every input row so cleaning could not silently remove data."

Silver entity 2 — `silver.suppliers`

Bronze input: `bronze.erp_suppliers`.

Silver grain: One accepted, conformed record at the entity grain defined by the source-to-target mapping.

Cleaning responsibility: trim, cast, standardize, deduplicate, validate, and quarantine.

Rejected output: Entity-specific rejection/quarantine rows with `_batch_id`, business key when available, rule ID, reason, offsetting value, and rejection timestamp.

Business impact: Incorrect cleaning can duplicate revenue, misidentify customers, lose history, overstate inventory, misattribute marketing, or hide late shipments.

Action 10.4.SV2 — Build and test `silver.suppliers`

Application:

Databricks workspace in a web browser

Window or panel:

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

Starting condition:

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Build and test `silver.suppliers`. This is one bounded construction or inspection task.

Why this action comes now:

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

Exact physical actions:

1. CLICK: Open the Silver notebook responsible for `suppliers`.
2. LOOK FOR: Display a dirty Bronze example before writing a cleaning rule.
3. TYPE THIS: Add one explicit rule for the problem, including a rejection reason when the row is not accepted.
4. PRESS: Run the rule against the current batch only.
5. LOOK FOR: Display accepted and rejected examples side by side.
6. PRESS: Count Bronze input, Silver accepted, and rejected rows.
7. LOOK FOR: Require `input = accepted + rejected` unless the contract documents a separate deduplication accounting category.
8. PRESS: Run edge-case tests for null, whitespace, malformed date, duplicate business key, negative amount/quantity, and unknown reference as applicable.
9. DO NOT CONTINUE UNTIL: Counts reconcile and the expected dirty fixture produces the expected outcome.

Command or code:

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

Where to enter it:

Databricks workspace in a web browser. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

What each part means:

1. CLICK: Open the Silver notebook responsible for `suppliers`.
2. LOOK FOR: Display a dirty Bronze example before writing a cleaning rule.
3. TYPE THIS: Add one explicit rule for the problem, including a rejection reason when the row is not accepted.
4. PRESS: Run the rule against the current batch only.
5. LOOK FOR: Display accepted and rejected examples side by side.
6. PRESS: Count Bronze input, Silver accepted, and rejected rows.
7. LOOK FOR: Require `input = accepted + rejected` unless the contract documents a separate deduplication accounting category.
8. PRESS: Run edge-case tests for null, whitespace, malformed date, duplicate business key, negative amount/quantity, and unknown reference as applicable.
9. DO NOT CONTINUE UNTIL: Counts reconcile and the expected dirty fixture produces the expected outcome.

What should happen:

A visible file, folder, branch, connection, table, notebook, task, relationship, measure, visual, or verification result should appear exactly where the action predicts.

Expected example:

Your exact values may differ. The expected result is the same *type* of object and the same required status, not necessarily the same timestamps, row counts, colors, generated IDs, or screen dimensions.

What may look different:

Menu wording can vary by product release or account tier. Use the official-source register and look for the described object rather than guessing from an old screenshot.

How to verify success:

Reopen or refresh the relevant panel, locate the named object, and inspect the property or output that proves it exists and is in the intended location.

Do not continue unless:

You can point to the visible result and explain what it proves. Mark the action VERIFIED BY USER only after that check.

Common mistake:

Combining several clicks or decisions, choosing a similarly named object, or continuing because no error dialog appeared.

Exact recovery:

Stop at the current screen. Save a screenshot of the error if useful, hide sensitive values, and compare the selected location with the starting condition. Use Back or Cancel rather than Delete or Overwrite. Correct one mismatch and repeat only this action.

What you just accomplished:

You completed one observable piece of the Northstar Retail platform and established a checkpoint that can be audited later.

How this connects to the project:

The resulting object, decision, or evidence becomes an input to the next stage in the source-to-consumption chain.

- **Line 9:** `.option("replaceWhere", f"_batch_id = '{batch_id}')` — `.` is a path, relative location, branch-style name, or file argument; verify every character before running it; `option` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `(` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `"replaceWhere"` is a quoted literal; the quotation marks preserve spaces or mark text; `,` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `f` is a name, keyword, argument, identifier, or literal whose

project-specific role is described in the surrounding explanation; `"_batch_id = '{batch_id}'"` is a quoted literal; the quotation marks preserve spaces or mark text; `)` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation

- **Line 10:** `.saveAsTable(f"{catalog}.silver.suppliers"))` — `.` is a path, relative location, branch-style name, or file argument; verify every character before running it; `saveAsTable` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `(` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `f` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `"{catalog}.silver.suppliers"` is a quoted literal; the quotation marks preserve spaces or mark text; `)` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation

Edge-case test worksheet

- Actual Bronze rows: [ENTER COUNT]
- Accepted Silver rows: [ENTER COUNT]
- Rejected rows: [ENTER COUNT]
- Deduplicated-but-accounted rows: [ENTER COUNT OR 0]
- Reconciliation equation: [WRITE THE EQUATION AND RESULT]
- Controlled dirty fixture observed: [YES/NO + RULE ID]
- Rerun result for same batch: [ENTER RESULT]

Common error and recovery

If a cast turns invalid text into null, do not filter nulls without recording them. Add a pre-cast raw column or parse-valid flag, write a rejection reason, reconcile counts, and rerun the batch-scoped partition. If a duplicate rule chooses different survivors across runs, add deterministic tie-break columns and test the ordering.

Interview-ready explanation

"I built `silver.suppliers` as a conformed entity with explicit acceptance and rejection rules. I demonstrated dirty input, validated edge cases, and reconciled every input row so cleaning could not silently remove data."

Silver entity 3 — `silver.products`

Bronze input: `bronze.erp_products`.

Silver grain: One accepted, conformed record at the entity grain defined by the source-to-target mapping.

Cleaning responsibility: trim, cast, standardize, deduplicate, validate, and quarantine.

Rejected output: Entity-specific rejection/quarantine rows with `_batch_id`, business key when available, rule ID, reason, offending value, and rejection timestamp.

Business impact: Incorrect cleaning can duplicate revenue, misidentify customers, lose history, overstate inventory, misattribute marketing, or hide late shipments.

Action 10.4.SV3 — Build and test `silver.products`

Application:

Databricks workspace in a web browser

Window or panel:

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

Starting condition:

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Build and test `silver.products`. This is one bounded construction or inspection task.

Why this action comes now:

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

Exact physical actions:

1. CLICK: Open the Silver notebook responsible for products.

2. LOOK FOR: Display a dirty Bronze example before writing a cleaning rule.
3. TYPE THIS: Add one explicit rule for the problem, including a rejection reason when the row is not accepted.
4. PRESS: Run the rule against the current batch only.
5. LOOK FOR: Display accepted and rejected examples side by side.
6. PRESS: Count Bronze input, Silver accepted, and rejected rows.
7. LOOK FOR: Require input = accepted + rejected unless the contract documents a separate deduplication accounting category.
8. PRESS: Run edge-case tests for null, whitespace, malformed date, duplicate business key, negative amount/quantity, and unknown reference as applicable.
9. DO NOT CONTINUE UNTIL: Counts reconcile and the expected dirty fixture produces the expected outcome.

Command or code:

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

Where to enter it:

Databricks workspace in a web browser. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

What each part means:

1. CLICK: Open the Silver notebook responsible for products.
2. LOOK FOR: Display a dirty Bronze example before writing a cleaning rule.
3. TYPE THIS: Add one explicit rule for the problem, including a rejection reason when the row is not accepted.
4. PRESS: Run the rule against the current batch only.
5. LOOK FOR: Display accepted and rejected examples side by side.
6. PRESS: Count Bronze input, Silver accepted, and rejected rows.
7. LOOK FOR: Require input = accepted + rejected unless the contract documents a separate deduplication accounting category.
8. PRESS: Run edge-case tests for null, whitespace, malformed date, duplicate business key, negative amount/quantity, and unknown reference as applicable.
9. DO NOT CONTINUE UNTIL: Counts reconcile and the expected dirty fixture produces the expected outcome.

What should happen:

A visible file, folder, branch, connection, table, notebook, task, relationship, measure, visual, or verification result should appear exactly where the action predicts.

Expected example:

Your exact values may differ. The expected result is the same *type* of object and the same required status, not necessarily the same timestamps, row counts, colors, generated IDs, or screen dimensions.

What may look different:

Menu wording can vary by product release or account tier. Use the official-source register and look for the described object rather than guessing from an old screenshot.

How to verify success:

Reopen or refresh the relevant panel, locate the named object, and inspect the property or output that proves it exists and is in the intended location.

Do not continue unless:

You can point to the visible result and explain what it proves. Mark the action VERIFIED BY USER only after that check.

Common mistake:

Combining several clicks or decisions, choosing a similarly named object, or continuing because no error dialog appeared.

Exact recovery:

Stop at the current screen. Save a screenshot of the error if useful, hide sensitive values, and compare the selected location with the starting condition. Use Back or Cancel rather than Delete or Overwrite. Correct one mismatch and repeat only this action.

What you just accomplished:

You completed one observable piece of the Northstar Retail platform and established a checkpoint that can be audited later.

How this connects to the project:

The resulting object, decision, or evidence becomes an input to the next stage in the source-to-consumption chain.

Dirty input → rule → expected outputs

Scenario	Dirty input example	Rule	Accepted output	Rejected output	Count expectation
Whitespace/case	padded or mixed-case code	trim and standardize governed code	normalized value	none when otherwise valid	one input becomes one accepted row
Invalid required value	null, malformed, or impossible value	validate business and type rule	none	original value plus reason	one input becomes one rejected row
Duplicate business key	two candidate rows	deterministic ordering and survivor rule	one survivor	duplicate/reconciliation record	input count remains explainable
Unknown reference	key absent from conformed parent	preserve for unknown-key handling or reject per contract	explicit unknown handling	monitored exception if policy requires	no silent row loss
Date boundary	end before start or impossible timestamp	compare parsed dates	corrected only when rule permits	otherwise reject	no coerced nonsense dates

Teaching code section

```
source_df = spark.table(f"{catalog}.bronze.erp_products")
standardized_df = source_df.select(
    "*",
    F.trim(F.col(source_df.columns[0]).cast("string")).alias("_example_standardized_key")
)
valid_df = standardized_df.filter(F.col("_batch_id") == batch_id)
rejected_df = standardized_df.subtract(valid_df)
(valid_df.write.format("delta").mode("overwrite")
    .option("replaceWhere", f"_batch_id = '{batch_id}'")
    .saveAsTable(f"{catalog}.silver.products"))
```

Line-by-line explanation

Common error and recovery

If a cast turns invalid text into null, do not filter nulls without recording them. Add a pre-cast raw column or parse-valid flag, write a rejection reason, reconcile counts, and rerun the batch-scoped partition. If a duplicate rule chooses different survivors across runs, add deterministic tie-break columns and test the ordering.

Interview-ready explanation

"I built `silver.products` as a conformed entity with explicit acceptance and rejection rules. I demonstrated dirty input, validated edge cases, and reconciled every input row so cleaning could not silently remove data."

Silver entity 4 — `silver.stores`

Bronze input: `bronze.erp_stores`.

Silver grain: One accepted, conformed record at the entity grain defined by the source-to-target mapping.

Cleaning responsibility: trim, cast, standardize, deduplicate, validate, and quarantine.

Rejected output: Entity-specific rejection/quarantine rows with `_batch_id`, business key when available, rule ID, reason, offending value, and rejection timestamp.

Business impact: Incorrect cleaning can duplicate revenue, misidentify customers, lose history, overstate inventory, misattribute marketing, or hide late shipments.

Action 10.4.SV4 — Build and test `silver.stores`

Application:

Databricks workspace in a web browser

Window or panel:

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

Starting condition:

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Build and test `silver.stores`. This is one bounded construction or inspection task.

Why this action comes now:

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

Exact physical actions:

1. CLICK: Open the Silver notebook responsible for `stores`.
2. LOOK FOR: Display a dirty Bronze example before writing a cleaning rule.
3. TYPE THIS: Add one explicit rule for the problem, including a rejection reason when the row is not accepted.
4. PRESS: Run the rule against the current batch only.
5. LOOK FOR: Display accepted and rejected examples side by side.
6. PRESS: Count Bronze input, Silver accepted, and rejected rows.
7. LOOK FOR: Require `input = accepted + rejected` unless the contract documents a separate deduplication accounting category.
8. PRESS: Run edge-case tests for null, whitespace, malformed date, duplicate business key, negative amount/quantity, and unknown reference as applicable.
9. DO NOT CONTINUE UNTIL: Counts reconcile and the expected dirty fixture produces the expected outcome.

Command or code:

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

Where to enter it:

Databricks workspace in a web browser. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

What each part means:

1. CLICK: Open the Silver notebook responsible for `stores`.

2. LOOK FOR: Display a dirty Bronze example before writing a cleaning rule.
3. TYPE THIS: Add one explicit rule for the problem, including a rejection reason when the row is not accepted.
4. PRESS: Run the rule against the current batch only.
5. LOOK FOR: Display accepted and rejected examples side by side.
6. PRESS: Count Bronze input, Silver accepted, and rejected rows.
7. LOOK FOR: Require input = accepted + rejected unless the contract documents a separate deduplication accounting category.
8. PRESS: Run edge-case tests for null, whitespace, malformed date, duplicate business key, negative amount/quantity, and unknown reference as applicable.
9. DO NOT CONTINUE UNTIL: Counts reconcile and the expected dirty fixture produces the expected outcome.

What should happen:

A visible file, folder, branch, connection, table, notebook, task, relationship, measure, visual, or verification result should appear exactly where the action predicts.

Expected example:

Your exact values may differ. The expected result is the same *type* of object and the same required status, not necessarily the same timestamps, row counts, colors, generated IDs, or screen dimensions.

Edge-case test worksheet

- Actual Bronze rows: [ENTER COUNT]
- Accepted Silver rows: [ENTER COUNT]
- Rejected rows: [ENTER COUNT]
- Deduplicated-but-accounted rows: [ENTER COUNT OR 0]
- Reconciliation equation: [WRITE THE EQUATION AND RESULT]
- Controlled dirty fixture observed: [YES/NO + RULE ID]
- Rerun result for same batch: [ENTER RESULT]

Common error and recovery

If a cast turns invalid text into null, do not filter nulls without recording them. Add a pre-cast raw column or parse-valid flag, write a rejection reason, reconcile counts, and rerun the batch-scoped partition. If a duplicate rule chooses different survivors across runs, add deterministic tie-break columns and test the ordering.

Interview-ready explanation

"I built `silver.stores` as a conformed entity with explicit acceptance and rejection rules. I demonstrated dirty input, validated edge cases, and reconciled every input row so cleaning could not silently remove data."

Silver entity 5 — `silver.employees`

Bronze input: `bronze.erp_employees`.

Silver grain: One accepted, conformed record at the entity grain defined by the source-to-target mapping.

Cleaning responsibility: trim, cast, standardize, deduplicate, validate, and quarantine.

Rejected output: Entity-specific rejection/quarantine rows with `_batch_id`, business key when available, rule ID, reason, of-fending value, and rejection timestamp.

Business impact: Incorrect cleaning can duplicate revenue, misidentify customers, lose history, overstate inventory, misattribute marketing, or hide late shipments.

Action 10.4.SV5 — Build and test `silver.employees`

Application:

Databricks workspace in a web browser

Window or panel:

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

Starting condition:

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Build and test `silver.employees`. This is one bounded construction or inspection task.

Why this action comes now:

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

Exact physical actions:

1. CLICK: Open the Silver notebook responsible for `employees`.
2. LOOK FOR: Display a dirty Bronze example before writing a cleaning rule.
3. TYPE THIS: Add one explicit rule for the problem, including a rejection reason when the row is not accepted.
4. PRESS: Run the rule against the current batch only.
5. LOOK FOR: Display accepted and rejected examples side by side.
6. PRESS: Count Bronze input, Silver accepted, and rejected rows.
7. LOOK FOR: Require `input = accepted + rejected` unless the contract documents a separate deduplication accounting category.
8. PRESS: Run edge-case tests for null, whitespace, malformed date, duplicate business key, negative amount/quantity, and unknown reference as applicable.
9. DO NOT CONTINUE UNTIL: Counts reconcile and the expected dirty fixture produces the expected outcome.

Command or code:

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

Where to enter it:

Databricks workspace in a web browser. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

What each part means:

1. CLICK: Open the Silver notebook responsible for `employees`.
2. LOOK FOR: Display a dirty Bronze example before writing a cleaning rule.
3. TYPE THIS: Add one explicit rule for the problem, including a rejection reason when the row is not accepted.
4. PRESS: Run the rule against the current batch only.
5. LOOK FOR: Display accepted and rejected examples side by side.
6. PRESS: Count Bronze input, Silver accepted, and rejected rows.
7. LOOK FOR: Require `input = accepted + rejected` unless the contract documents a separate deduplication accounting category.
8. PRESS: Run edge-case tests for null, whitespace, malformed date, duplicate business key, negative amount/quantity, and unknown reference as applicable.
9. DO NOT CONTINUE UNTIL: Counts reconcile and the expected dirty fixture produces the expected outcome.

What should happen:

A visible file, folder, branch, connection, table, notebook, task, relationship, measure, visual, or verification result should appear exactly where the action predicts.

Expected example:

Your exact values may differ. The expected result is the same *type* of object and the same required status, not necessarily the same timestamps, row counts, colors, generated IDs, or screen dimensions.

What may look different:

Menu wording can vary by product release or account tier. Use the official-source register and look for the described object rather than guessing from an old screenshot.

How to verify success:

Reopen or refresh the relevant panel, locate the named object, and inspect the property or output that proves it exists and is in the intended location.

Do not continue unless:

You can point to the visible result and explain what it proves. Mark the action VERIFIED BY USER only after that check.

Common mistake:

Combining several clicks or decisions, choosing a similarly named object, or continuing because no error dialog appeared.

Exact recovery:

Stop at the current screen. Save a screenshot of the error if useful, hide sensitive values, and compare the selected location with the starting condition. Use Back or Cancel rather than Delete or Overwrite. Correct one mismatch and repeat only this action.

What you just accomplished:

You completed one observable piece of the Northstar Retail platform and established a checkpoint that can be audited later.

How this connects to the project:

The resulting object, decision, or evidence becomes an input to the next stage in the source-to-consumption chain.

Dirty input → rule → expected outputs

Scenario	Dirty input example	Rule	Accepted output	Rejected output	Count expectation
Whitespace/case	padded or mixed-case code	trim and standardize governed code	normalized value	none when otherwise valid	one input becomes one accepted row
Invalid required value	null, malformed, or impossible value	validate business and type rule	none	original value plus reason	one input becomes one rejected row
Duplicate business key	two candidate rows	deterministic ordering and survivor rule	one survivor	duplicate/reconciliation record	input count remains explainable
Unknown reference	key absent from conformed parent	preserve for unknown-key handling or reject per contract	explicit unknown handling	monitored exception if policy requires	no silent row loss
Date boundary	end before start or impossible timestamp	compare parsed dates	corrected only when rule permits	otherwise reject	no coerced nonsense dates

Teaching code section

```
source_df = spark.table(f"{catalog}.bronze.erp_employees")
standardized_df = source_df.select(
    "*",
    F.trim(F.col(source_df.columns[0]).cast("string")).alias("_example_standardized_key")
)
valid_df = standardized_df.filter(F.col("_batch_id") == batch_id)
rejected_df = standardized_df.subtract(valid_df)
(valid_df.write.format("delta").mode("overwrite")
.option("replaceWhere", f"_batch_id = '{batch_id}'")
.saveAsTable(f"{catalog}.silver.employees"))
```

fier, or literal whose project-specific role is described in the surrounding explanation; "{catalog}.silver.employees" is a quoted literal; the quotation marks preserve spaces or mark text;)) is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation

Edge-case test worksheet

- Actual Bronze rows: [ENTER COUNT]
- Accepted Silver rows: [ENTER COUNT]
- Rejected rows: [ENTER COUNT]
- Deduplicated-but-accounted rows: [ENTER COUNT OR 0]
- Reconciliation equation: [WRITE THE EQUATION AND RESULT]
- Controlled dirty fixture observed: [YES/NO + RULE ID]
- Rerun result for same batch: [ENTER RESULT]

Common error and recovery

If a cast turns invalid text into null, do not filter nulls without recording them. Add a pre-cast raw column or parse-valid flag, write a rejection reason, reconcile counts, and rerun the batch-scoped partition. If a duplicate rule chooses different survivors across runs, add deterministic tie-break columns and test the ordering.

Interview-ready explanation

"I built `silver.employees` as a conformed entity with explicit acceptance and rejection rules. I demonstrated dirty input, validated edge cases, and reconciled every input row so cleaning could not silently remove data."

Silver entity 6 — `silver.customers`

Bronze input: `bronze.erp_customers`.

Silver grain: One accepted, conformed record at the entity grain defined by the source-to-target mapping.

Cleaning responsibility: trim, cast, standardize, deduplicate, validate, and quarantine.

Rejected output: Entity-specific rejection/quarantine rows with `_batch_id`, business key when available, rule ID, reason, offending value, and rejection timestamp.

Business impact: Incorrect cleaning can duplicate revenue, misidentify customers, lose history, overstate inventory, misattribute marketing, or hide late shipments.

Action 10.4.SV6 — Build and test `silver.customers`

Application:

Databricks workspace in a web browser

Window or panel:

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

Starting condition:

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Build and test `silver.customers`. This is one bounded construction or inspection task.

Why this action comes now:

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

Exact physical actions:

1. CLICK: Open the Silver notebook responsible for customers.
2. LOOK FOR: Display a dirty Bronze example before writing a cleaning rule.
3. TYPE THIS: Add one explicit rule for the problem, including a rejection reason when the row is not accepted.
4. PRESS: Run the rule against the current batch only.
5. LOOK FOR: Display accepted and rejected examples side by side.
6. PRESS: Count Bronze input, Silver accepted, and rejected rows.
7. LOOK FOR: Require `input = accepted + rejected` unless the contract documents a separate deduplication accounting category.
8. PRESS: Run edge-case tests for null, whitespace, malformed date, duplicate business key, negative amount/quantity, and unknown reference as applicable.
9. DO NOT CONTINUE UNTIL: Counts reconcile and the expected dirty fixture produces the expected outcome.

Command or code:

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

Where to enter it:

Databricks workspace in a web browser. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

What each part means:

1. CLICK: Open the Silver notebook responsible for customers.
2. LOOK FOR: Display a dirty Bronze example before writing a cleaning rule.
3. TYPE THIS: Add one explicit rule for the problem, including a rejection reason when the row is not accepted.
4. PRESS: Run the rule against the current batch only.
5. LOOK FOR: Display accepted and rejected examples side by side.
6. PRESS: Count Bronze input, Silver accepted, and rejected rows.
7. LOOK FOR: Require `input = accepted + rejected` unless the contract documents a separate deduplication accounting category.
8. PRESS: Run edge-case tests for null, whitespace, malformed date, duplicate business key, negative amount/quantity, and unknown reference as applicable.
9. DO NOT CONTINUE UNTIL: Counts reconcile and the expected dirty fixture produces the expected outcome.

What should happen:

A visible file, folder, branch, connection, table, notebook, task, relationship, measure, visual, or verification result should appear exactly where the action predicts.

Expected example:

Your exact values may differ. The expected result is the same *type* of object and the same required status, not necessarily the same timestamps, row counts, colors, generated IDs, or screen dimensions.

What may look different:

Menu wording can vary by product release or account tier. Use the official-source register and look for the described object rather than guessing from an old screenshot.

How to verify success:

Reopen or refresh the relevant panel, locate the named object, and inspect the property or output that proves it exists and is in the intended location.

Do not continue unless:

You can point to the visible result and explain what it proves. Mark the action VERIFIED BY USER only after that check.

Common mistake:

Combining several clicks or decisions, choosing a similarly named object, or continuing because no error dialog appeared.

Exact recovery:

Stop at the current screen. Save a screenshot of the error if useful, hide sensitive values, and compare the selected location with the starting condition. Use Back or Cancel rather than Delete or Overwrite. Correct one mismatch and repeat only this action.

What you just accomplished:

You completed one observable piece of the Northstar Retail platform and established a checkpoint that can be audited later.

How this connects to the project:

The resulting object, decision, or evidence becomes an input to the next stage in the source-to-consumption chain.

- **Line 9:** `.option("replaceWhere", f"_batch_id = '{batch_id}')` — `.` is a path, relative location, branch-style name, or file argument; verify every character before running it; `option` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `(` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `"replaceWhere"` is a quoted literal; the quotation marks preserve spaces or mark text; `,` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `f` is a name, keyword, argument, identifier, or literal whose

project-specific role is described in the surrounding explanation; `_batch_id = '{batch_id}'` is a quoted literal; the quotation marks preserve spaces or mark text; `)` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation

- **Line 10:** `.saveAsTable(f"{catalog}.silver.customers"))` — `.` is a path, relative location, branch-style name, or file argument; verify every character before running it; `saveAsTable` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `(` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `f` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `"{catalog}.silver.customers"` is a quoted literal; the quotation marks preserve spaces or mark text; `)` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation

Edge-case test worksheet

- Actual Bronze rows: [ENTER COUNT]
- Accepted Silver rows: [ENTER COUNT]
- Rejected rows: [ENTER COUNT]
- Deduplicated-but-accounted rows: [ENTER COUNT OR 0]
- Reconciliation equation: [WRITE THE EQUATION AND RESULT]
- Controlled dirty fixture observed: [YES/NO + RULE ID]
- Rerun result for same batch: [ENTER RESULT]

Common error and recovery

If a cast turns invalid text into null, do not filter nulls without recording them. Add a pre-cast raw column or parse-valid flag, write a rejection reason, reconcile counts, and rerun the batch-scoped partition. If a duplicate rule chooses different survivors across runs, add deterministic tie-break columns and test the ordering.

Interview-ready explanation

"I built `silver.customers` as a conformed entity with explicit acceptance and rejection rules. I demonstrated dirty input, validated edge cases, and reconciled every input row so cleaning could not silently remove data."

Silver entity 7 — `silver.addresses`

Bronze input: `bronze.erp_addresses`.

Silver grain: One accepted, conformed record at the entity grain defined by the source-to-target mapping.

Cleaning responsibility: trim, cast, standardize, deduplicate, validate, and quarantine.

Rejected output: Entity-specific rejection/quarantine rows with `_batch_id`, business key when available, rule ID, reason, offending value, and rejection timestamp.

Business impact: Incorrect cleaning can duplicate revenue, misidentify customers, lose history, overstate inventory, misattribute marketing, or hide late shipments.

Action 10.4.SV7 — Build and test `silver.addresses`

Application:

Databricks workspace in a web browser

Window or panel:

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

Starting condition:

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Build and test `silver.addresses`. This is one bounded construction or inspection task.

Why this action comes now:

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

Exact physical actions:

1. CLICK: Open the Silver notebook responsible for addresses.

2. LOOK FOR: Display a dirty Bronze example before writing a cleaning rule.
3. TYPE THIS: Add one explicit rule for the problem, including a rejection reason when the row is not accepted.
4. PRESS: Run the rule against the current batch only.
5. LOOK FOR: Display accepted and rejected examples side by side.
6. PRESS: Count Bronze input, Silver accepted, and rejected rows.
7. LOOK FOR: Require input = accepted + rejected unless the contract documents a separate deduplication accounting category.
8. PRESS: Run edge-case tests for null, whitespace, malformed date, duplicate business key, negative amount/quantity, and unknown reference as applicable.
9. DO NOT CONTINUE UNTIL: Counts reconcile and the expected dirty fixture produces the expected outcome.

Command or code:

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

Where to enter it:

Databricks workspace in a web browser. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

What each part means:

1. CLICK: Open the Silver notebook responsible for addresses.
2. LOOK FOR: Display a dirty Bronze example before writing a cleaning rule.
3. TYPE THIS: Add one explicit rule for the problem, including a rejection reason when the row is not accepted.
4. PRESS: Run the rule against the current batch only.
5. LOOK FOR: Display accepted and rejected examples side by side.
6. PRESS: Count Bronze input, Silver accepted, and rejected rows.
7. LOOK FOR: Require input = accepted + rejected unless the contract documents a separate deduplication accounting category.
8. PRESS: Run edge-case tests for null, whitespace, malformed date, duplicate business key, negative amount/quantity, and unknown reference as applicable.
9. DO NOT CONTINUE UNTIL: Counts reconcile and the expected dirty fixture produces the expected outcome.

What should happen:

A visible file, folder, branch, connection, table, notebook, task, relationship, measure, visual, or verification result should appear exactly where the action predicts.

Expected example:

Your exact values may differ. The expected result is the same *type* of object and the same required status, not necessarily the same timestamps, row counts, colors, generated IDs, or screen dimensions.

What may look different:

Menu wording can vary by product release or account tier. Use the official-source register and look for the described object rather than guessing from an old screenshot.

How to verify success:

Reopen or refresh the relevant panel, locate the named object, and inspect the property or output that proves it exists and is in the intended location.

Do not continue unless:

You can point to the visible result and explain what it proves. Mark the action VERIFIED BY USER only after that check.

Common mistake:

Combining several clicks or decisions, choosing a similarly named object, or continuing because no error dialog appeared.

Exact recovery:

Stop at the current screen. Save a screenshot of the error if useful, hide sensitive values, and compare the selected location with the starting condition. Use Back or Cancel rather than Delete or Overwrite. Correct one mismatch and repeat only this action.

What you just accomplished:

You completed one observable piece of the Northstar Retail platform and established a checkpoint that can be audited later.

How this connects to the project:

The resulting object, decision, or evidence becomes an input to the next stage in the source-to-consumption chain.

Dirty input → rule → expected outputs

Scenario	Dirty input example	Rule	Accepted output	Rejected output	Count expectation
Whitespace/case	padded or mixed-case code	trim and standardize governed code	normalized value	none when otherwise valid	one input becomes one accepted row
Invalid required value	null, malformed, or impossible value	validate business and type rule	none	original value plus reason	one input becomes one rejected row
Duplicate business key	two candidate rows	deterministic ordering and survivor rule	one survivor	duplicate/reconciliation record	input count remains explainable
Unknown reference	key absent from conformed parent	preserve for unknown-key handling or reject per contract	explicit unknown handling	monitored exception if policy requires	no silent row loss
Date boundary	end before start or impossible timestamp	compare parsed dates	corrected only when rule permits	otherwise reject	no coerced nonsense dates

Teaching code section

```
source_df = spark.table(f"{catalog}.bronze.erp_addresses")
standardized_df = source_df.select(
    "*",
    F.trim(F.col(source_df.columns[0]).cast("string")).alias("_example_standardized_key")
)
valid_df = standardized_df.filter(F.col("_batch_id") == batch_id)
rejected_df = standardized_df.subtract(valid_df)
(valid_df.write.format("delta").mode("overwrite")
    .option("replaceWhere", f"_batch_id = '{batch_id}'")
    .saveAsTable(f"{catalog}.silver.addresses"))
```

Line-by-line explanation

- Rerun result for same batch: [ENTER RESULT]

Common error and recovery

If a cast turns invalid text into null, do not filter nulls without recording them. Add a pre-cast raw column or parse-valid flag, write a rejection reason, reconcile counts, and rerun the batch-scoped partition. If a duplicate rule chooses different survivors across runs, add deterministic tie-break columns and test the ordering.

Interview-ready explanation

"I built `silver.addresses` as a conformed entity with explicit acceptance and rejection rules. I demonstrated dirty input, validated edge cases, and reconciled every input row so cleaning could not silently remove data."

Silver entity 8 — `silver.orders`

Bronze input: `bronze.erp_orders`.

Silver grain: One accepted, conformed record at the entity grain defined by the source-to-target mapping.

Cleaning responsibility: trim, cast, standardize, deduplicate, validate, and quarantine.

Rejected output: Entity-specific rejection/quarantine rows with `_batch_id`, business key when available, rule ID, reason, offending value, and rejection timestamp.

Business impact: Incorrect cleaning can duplicate revenue, misidentify customers, lose history, overstate inventory, misattribute marketing, or hide late shipments.

Action 10.4.SV8 — Build and test `silver.orders`

Application:

Databricks workspace in a web browser

Window or panel:

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

Starting condition:

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Build and test `silver.orders`. This is one bounded construction or inspection task.

Why this action comes now:

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

Exact physical actions:

1. CLICK: Open the Silver notebook responsible for orders.
2. LOOK FOR: Display a dirty Bronze example before writing a cleaning rule.
3. TYPE THIS: Add one explicit rule for the problem, including a rejection reason when the row is not accepted.
4. PRESS: Run the rule against the current batch only.
5. LOOK FOR: Display accepted and rejected examples side by side.
6. PRESS: Count Bronze input, Silver accepted, and rejected rows.
7. LOOK FOR: Require `input = accepted + rejected` unless the contract documents a separate deduplication accounting category.
8. PRESS: Run edge-case tests for null, whitespace, malformed date, duplicate business key, negative amount/quantity, and unknown reference as applicable.
9. DO NOT CONTINUE UNTIL: Counts reconcile and the expected dirty fixture produces the expected outcome.

Command or code:

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

Where to enter it:

Databricks workspace in a web browser. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

What each part means:

1. CLICK: Open the Silver notebook responsible for orders.

2. LOOK FOR: Display a dirty Bronze example before writing a cleaning rule.
3. TYPE THIS: Add one explicit rule for the problem, including a rejection reason when the row is not accepted.
4. PRESS: Run the rule against the current batch only.
5. LOOK FOR: Display accepted and rejected examples side by side.
6. PRESS: Count Bronze input, Silver accepted, and rejected rows.
7. LOOK FOR: Require input = accepted + rejected unless the contract documents a separate deduplication accounting category.
8. PRESS: Run edge-case tests for null, whitespace, malformed date, duplicate business key, negative amount/quantity, and unknown reference as applicable.
9. DO NOT CONTINUE UNTIL: Counts reconcile and the expected dirty fixture produces the expected outcome.

What should happen:

A visible file, folder, branch, connection, table, notebook, task, relationship, measure, visual, or verification result should appear exactly where the action predicts.

Expected example:

Your exact values may differ. The expected result is the same *type* of object and the same required status, not necessarily the same timestamps, row counts, colors, generated IDs, or screen dimensions.

What may look different:

Menu wording can vary by product release or account tier. Use the official-source register and look for the described object rather than guessing from an old screenshot.

How to verify success:

Reopen or refresh the relevant panel, locate the named object, and inspect the property or output that proves it exists and is in the intended location.

Do not continue unless:

You can point to the visible result and explain what it proves. Mark the action VERIFIED BY USER only after that check.

Common mistake:

Combining several clicks or decisions, choosing a similarly named object, or continuing because no error dialog appeared.

Exact recovery:

Stop at the current screen. Save a screenshot of the error if useful, hide sensitive values, and compare the selected location with the starting condition. Use Back or Cancel rather than Delete or Overwrite. Correct one mismatch and repeat only this action.

What you just accomplished:

You completed one observable piece of the Northstar Retail platform and established a checkpoint that can be audited later.

How this connects to the project:

The resulting object, decision, or evidence becomes an input to the next stage in the source-to-consumption chain.

Edge-case test worksheet

- Actual Bronze rows: [ENTER COUNT]
- Accepted Silver rows: [ENTER COUNT]
- Rejected rows: [ENTER COUNT]
- Deduplicated-but-accounted rows: [ENTER COUNT OR 0]
- Reconciliation equation: [WRITE THE EQUATION AND RESULT]
- Controlled dirty fixture observed: [YES/NO + RULE ID]
- Rerun result for same batch: [ENTER RESULT]

Common error and recovery

If a cast turns invalid text into null, do not filter nulls without recording them. Add a pre-cast raw column or parse-valid flag, write a rejection reason, reconcile counts, and rerun the batch-scoped partition. If a duplicate rule chooses different survivors across runs, add deterministic tie-break columns and test the ordering.

Interview-ready explanation

"I built `silver.orders` as a conformed entity with explicit acceptance and rejection rules. I demonstrated dirty input, validated edge cases, and reconciled every input row so cleaning could not silently remove data."

Silver entity 9 — `silver.order_items`

Bronze input: `bronze.erp_order_items`.

Silver grain: One accepted, conformed record at the entity grain defined by the source-to-target mapping.

Cleaning responsibility: trim, cast, standardize, deduplicate, validate, and quarantine.

Rejected output: Entity-specific rejection/quarantine rows with `_batch_id`, business key when available, rule ID, reason, of-fending value, and rejection timestamp.

Business impact: Incorrect cleaning can duplicate revenue, misidentify customers, lose history, overstate inventory, misattribute marketing, or hide late shipments.

Action 10.4.SV9 — Build and test `silver.order_items`

Application:

Databricks workspace in a web browser

Window or panel:

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

Starting condition:

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Build and test `silver.order_items`. This is one bounded construction or inspection task.

Why this action comes now:

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

Exact physical actions:

1. CLICK: Open the Silver notebook responsible for `order_items`.
2. LOOK FOR: Display a dirty Bronze example before writing a cleaning rule.
3. TYPE THIS: Add one explicit rule for the problem, including a rejection reason when the row is not accepted.
4. PRESS: Run the rule against the current batch only.
5. LOOK FOR: Display accepted and rejected examples side by side.
6. PRESS: Count Bronze input, Silver accepted, and rejected rows.
7. LOOK FOR: Require `input = accepted + rejected` unless the contract documents a separate deduplication accounting category.
8. PRESS: Run edge-case tests for null, whitespace, malformed date, duplicate business key, negative amount/quantity, and unknown reference as applicable.
9. DO NOT CONTINUE UNTIL: Counts reconcile and the expected dirty fixture produces the expected outcome.

Command or code:

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

Where to enter it:

Databricks workspace in a web browser. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

What each part means:

1. CLICK: Open the Silver notebook responsible for `order_items`.
2. LOOK FOR: Display a dirty Bronze example before writing a cleaning rule.
3. TYPE THIS: Add one explicit rule for the problem, including a rejection reason when the row is not accepted.
4. PRESS: Run the rule against the current batch only.
5. LOOK FOR: Display accepted and rejected examples side by side.
6. PRESS: Count Bronze input, Silver accepted, and rejected rows.
7. LOOK FOR: Require `input = accepted + rejected` unless the contract documents a separate deduplication accounting category.
8. PRESS: Run edge-case tests for null, whitespace, malformed date, duplicate business key, negative amount/quantity, and unknown reference as applicable.
9. DO NOT CONTINUE UNTIL: Counts reconcile and the expected dirty fixture produces the expected outcome.

What should happen:

A visible file, folder, branch, connection, table, notebook, task, relationship, measure, visual, or verification result should appear exactly where the action predicts.

Expected example:

Your exact values may differ. The expected result is the same *type* of object and the same required status, not necessarily the same timestamps, row counts, colors, generated IDs, or screen dimensions.

What may look different:

Menu wording can vary by product release or account tier. Use the official-source register and look for the described object rather than guessing from an old screenshot.

How to verify success:

Reopen or refresh the relevant panel, locate the named object, and inspect the property or output that proves it exists and is in the intended location.

Do not continue unless:

You can point to the visible result and explain what it proves. Mark the action VERIFIED BY USER only after that check.

Common mistake:

Combining several clicks or decisions, choosing a similarly named object, or continuing because no error dialog appeared.

Exact recovery:

Stop at the current screen. Save a screenshot of the error if useful, hide sensitive values, and compare the selected location with the starting condition. Use Back or Cancel rather than Delete or Overwrite. Correct one mismatch and repeat only this action.

What you just accomplished:

You completed one observable piece of the Northstar Retail platform and established a checkpoint that can be audited later.

How this connects to the project:

The resulting object, decision, or evidence becomes an input to the next stage in the source-to-consumption chain.

Dirty input → rule → expected outputs

Scenario	Dirty input example	Rule	Accepted output	Rejected output	Count expectation
Whitespace/case	padded or mixed-case code	trim and standardize governed code	normalized value	none when otherwise valid	one input becomes one accepted row
Invalid required value	null, malformed, or impossible value	validate business and type rule	none	original value plus reason	one input becomes one rejected row
Duplicate business key	two candidate rows	deterministic ordering and survivor rule	one survivor	duplicate/reconciliation record	input count remains explainable
Unknown reference	key absent from conformed parent	preserve for unknown-key handling or reject per contract	explicit unknown handling	monitored exception if policy requires	no silent row loss
Date boundary	end before start or impossible timestamp	compare parsed dates	corrected only when rule permits	otherwise reject	no coerced nonsense dates

Teaching code section

```
source_df = spark.table(f"{catalog}.bronze.erp_order_items")
standardized_df = source_df.select(
    "*",
    F.trim(F.col(source_df.columns[0]).cast("string")).alias("_example_standardized_key")
)
valid_df = standardized_df.filter(F.col("_batch_id") == batch_id)
rejected_df = standardized_df.subtract(valid_df)
(valid_df.write.format("delta").mode("overwrite")
.option("replaceWhere", f"_batch_id = '{batch_id}'")
.saveAsTable(f"{catalog}.silver.order_items"))
```

Common error and recovery

If a cast turns invalid text into null, do not filter nulls without recording them. Add a pre-cast raw column or parse-valid flag, write a rejection reason, reconcile counts, and rerun the batch-scoped partition. If a duplicate rule chooses different survivors across runs, add deterministic tie-break columns and test the ordering.

Interview-ready explanation

"I built `silver.order_items` as a conformed entity with explicit acceptance and rejection rules. I demonstrated dirty input, validated edge cases, and reconciled every input row so cleaning could not silently remove data."

Silver entity 10 — `silver.payments`

Bronze input: `bronze.erp_payments`.

Silver grain: One accepted, conformed record at the entity grain defined by the source-to-target mapping.

Cleaning responsibility: trim, cast, standardize, deduplicate, validate, and quarantine.

Rejected output: Entity-specific rejection/quarantine rows with `_batch_id`, business key when available, rule ID, reason, offending value, and rejection timestamp.

Business impact: Incorrect cleaning can duplicate revenue, misidentify customers, lose history, overstate inventory, misattribute marketing, or hide late shipments.

Action 10.4.SV10 — Build and test `silver.payments`

Application:

Databricks workspace in a web browser

Window or panel:

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

Starting condition:

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Build and test `silver.payments`. This is one bounded construction or inspection task.

Why this action comes now:

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

Exact physical actions:

1. CLICK: Open the Silver notebook responsible for payments.
2. LOOK FOR: Display a dirty Bronze example before writing a cleaning rule.
3. TYPE THIS: Add one explicit rule for the problem, including a rejection reason when the row is not accepted.
4. PRESS: Run the rule against the current batch only.
5. LOOK FOR: Display accepted and rejected examples side by side.
6. PRESS: Count Bronze input, Silver accepted, and rejected rows.

7. LOOK FOR: Require input = accepted + rejected unless the contract documents a separate deduplication accounting category.
8. PRESS: Run edge-case tests for null, whitespace, malformed date, duplicate business key, negative amount/quantity, and unknown reference as applicable.
9. DO NOT CONTINUE UNTIL: Counts reconcile and the expected dirty fixture produces the expected outcome.

Command or code:

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

Where to enter it:

Databricks workspace in a web browser. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

What each part means:

1. CLICK: Open the Silver notebook responsible for payments.
2. LOOK FOR: Display a dirty Bronze example before writing a cleaning rule.
3. TYPE THIS: Add one explicit rule for the problem, including a rejection reason when the row is not accepted.
4. PRESS: Run the rule against the current batch only.
5. LOOK FOR: Display accepted and rejected examples side by side.
6. PRESS: Count Bronze input, Silver accepted, and rejected rows.
7. LOOK FOR: Require input = accepted + rejected unless the contract documents a separate deduplication accounting category.
8. PRESS: Run edge-case tests for null, whitespace, malformed date, duplicate business key, negative amount/quantity, and unknown reference as applicable.
9. DO NOT CONTINUE UNTIL: Counts reconcile and the expected dirty fixture produces the expected outcome.

What should happen:

A visible file, folder, branch, connection, table, notebook, task, relationship, measure, visual, or verification result should appear exactly where the action predicts.

Expected example:

Your exact values may differ. The expected result is the same *type* of object and the same required status, not necessarily the same timestamps, row counts, colors, generated IDs, or screen dimensions.

- **Line 10:** .saveAsTable(f"{catalog}.silver.payments") — . is a path, relative location, branch-style name, or file argument; verify every character before running it; saveAsTable is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; (is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; f is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; "{catalog}.silver.payments" is a quoted literal; the quotation marks preserve spaces or mark text;) is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation

Edge-case test worksheet

- Actual Bronze rows: [ENTER COUNT]
- Accepted Silver rows: [ENTER COUNT]
- Rejected rows: [ENTER COUNT]
- Deduplicated-but-accounted rows: [ENTER COUNT OR 0]
- Reconciliation equation: [WRITE THE EQUATION AND RESULT]
- Controlled dirty fixture observed: [YES/NO + RULE ID]
- Rerun result for same batch: [ENTER RESULT]

Common error and recovery

If a cast turns invalid text into null, do not filter nulls without recording them. Add a pre-cast raw column or parse-valid flag, write a rejection reason, reconcile counts, and rerun the batch-scoped partition. If a duplicate rule chooses different survivors across runs, add deterministic tie-break columns and test the ordering.

Interview-ready explanation

"I built `silver.payments` as a conformed entity with explicit acceptance and rejection rules. I demonstrated dirty input, validated edge cases, and reconciled every input row so cleaning could not silently remove data."

Silver entity 11 — `silver.shipments`

Bronze input: `bronze.erp_shipments`.

Silver grain: One accepted, conformed record at the entity grain defined by the source-to-target mapping.

Cleaning responsibility: trim, cast, standardize, deduplicate, validate, and quarantine.

Rejected output: Entity-specific rejection/quarantine rows with `_batch_id`, business key when available, rule ID, reason, of-fending value, and rejection timestamp.

Business impact: Incorrect cleaning can duplicate revenue, misidentify customers, lose history, overstate inventory, misattribute marketing, or hide late shipments.

Action 10.4.SV11 — Build and test `silver.shipments`

Application:

Databricks workspace in a web browser

Window or panel:

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

Starting condition:

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Build and test `silver.shipments`. This is one bounded construction or inspection task.

Why this action comes now:

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

Exact physical actions:

1. CLICK: Open the Silver notebook responsible for shipments.
2. LOOK FOR: Display a dirty Bronze example before writing a cleaning rule.
3. TYPE THIS: Add one explicit rule for the problem, including a rejection reason when the row is not accepted.
4. PRESS: Run the rule against the current batch only.
5. LOOK FOR: Display accepted and rejected examples side by side.
6. PRESS: Count Bronze input, Silver accepted, and rejected rows.
7. LOOK FOR: Require `input = accepted + rejected` unless the contract documents a separate deduplication accounting category.
8. PRESS: Run edge-case tests for null, whitespace, malformed date, duplicate business key, negative amount/quantity, and unknown reference as applicable.
9. DO NOT CONTINUE UNTIL: Counts reconcile and the expected dirty fixture produces the expected outcome.

Command or code:

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

Where to enter it:

Databricks workspace in a web browser. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

What each part means:

1. CLICK: Open the Silver notebook responsible for shipments.
2. LOOK FOR: Display a dirty Bronze example before writing a cleaning rule.
3. TYPE THIS: Add one explicit rule for the problem, including a rejection reason when the row is not accepted.
4. PRESS: Run the rule against the current batch only.
5. LOOK FOR: Display accepted and rejected examples side by side.
6. PRESS: Count Bronze input, Silver accepted, and rejected rows.

7. LOOK FOR: Require input = accepted + rejected unless the contract documents a separate deduplication accounting category.
8. PRESS: Run edge-case tests for null, whitespace, malformed date, duplicate business key, negative amount/quantity, and unknown reference as applicable.
9. DO NOT CONTINUE UNTIL: Counts reconcile and the expected dirty fixture produces the expected outcome.

What should happen:

A visible file, folder, branch, connection, table, notebook, task, relationship, measure, visual, or verification result should appear exactly where the action predicts.

Expected example:

Your exact values may differ. The expected result is the same *type* of object and the same required status, not necessarily the same timestamps, row counts, colors, generated IDs, or screen dimensions.

What may look different:

Menu wording can vary by product release or account tier. Use the official-source register and look for the described object rather than guessing from an old screenshot.

How to verify success:

Reopen or refresh the relevant panel, locate the named object, and inspect the property or output that proves it exists and is in the intended location.

Do not continue unless:

You can point to the visible result and explain what it proves. Mark the action VERIFIED BY USER only after that check.

Common mistake:

Combining several clicks or decisions, choosing a similarly named object, or continuing because no error dialog appeared.

Exact recovery:

Stop at the current screen. Save a screenshot of the error if useful, hide sensitive values, and compare the selected location with the starting condition. Use Back or Cancel rather than Delete or Overwrite. Correct one mismatch and repeat only this action.

What you just accomplished:

You completed one observable piece of the Northstar Retail platform and established a checkpoint that can be audited later.

How this connects to the project:

The resulting object, decision, or evidence becomes an input to the next stage in the source-to-consumption chain.

[Back to the Phase 10 lesson index](#)

Dirty input → rule → expected outputs

Scenario	Dirty input example	Rule	Accepted output	Rejected output	Count expectation
Whitespace/case	padded or mixed-case code	trim and standardize governed code	normalized value	none when otherwise valid	one input becomes one accepted row
Invalid required value	null, malformed, or impossible value	validate business and type rule	none	original value plus reason	one input becomes one rejected row
Duplicate business key	two candidate rows	deterministic ordering and survivor rule	one survivor	duplicate/reconciliation record	input count remains explainable
Unknown reference	key absent from conformed parent	preserve for unknown-key handling or reject per contract	explicit unknown handling	monitored exception if policy requires	no silent row loss
Date boundary	end before start or impossible timestamp	compare parsed dates	corrected only when rule permits	otherwise reject	no coerced nonsense dates

Teaching code section

```
source_df = spark.table(f"{catalog}.bronze.erp_shipments")
standardized_df = source_df.select(
    "*",
    F.trim(F.col(source_df.columns[0]).cast("string")).alias("_example_standardized_key")
)
valid_df = standardized_df.filter(F.col("_batch_id") == batch_id)
rejected_df = standardized_df.subtract(valid_df)
(valid_df.write.format("delta").mode("overwrite")
    .option("replaceWhere", f"_batch_id = '{batch_id}'")
    .saveAsTable(f"{catalog}.silver.shipments"))
```

Common error and recovery

If a cast turns invalid text into null, do not filter nulls without recording them. Add a pre-cast raw column or parse-valid flag, write a rejection reason, reconcile counts, and rerun the batch-scoped partition. If a duplicate rule chooses different survivors across runs, add deterministic tie-break columns and test the ordering.

Interview-ready explanation

"I built `silver.shipments` as a conformed entity with explicit acceptance and rejection rules. I demonstrated dirty input, validated edge cases, and reconciled every input row so cleaning could not silently remove data."

Silver entity 12 — `silver.inventory_transactions`

Bronze input: `bronze.erp_inventory_transactions`.

Silver grain: One accepted, conformed record at the entity grain defined by the source-to-target mapping.

Cleaning responsibility: trim, cast, standardize, deduplicate, validate, and quarantine.

Rejected output: Entity-specific rejection/quarantine rows with `_batch_id`, business key when available, rule ID, reason, of-fending value, and rejection timestamp.

Business impact: Incorrect cleaning can duplicate revenue, misidentify customers, lose history, overstate inventory, misattribute marketing, or hide late shipments.

Action 10.4.SV12 — Build and test `silver.inventory_transactions`

Application:

Databricks workspace in a web browser

Window or panel:

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

Starting condition:

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Build and test `silver.inventory_transactions`. This is one bounded construction or inspection task.

Why this action comes now:

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

Exact physical actions:

1. CLICK: Open the Silver notebook responsible for `inventory_transactions`.
2. LOOK FOR: Display a dirty Bronze example before writing a cleaning rule.
3. TYPE THIS: Add one explicit rule for the problem, including a rejection reason when the row is not accepted.
4. PRESS: Run the rule against the current batch only.
5. LOOK FOR: Display accepted and rejected examples side by side.
6. PRESS: Count Bronze input, Silver accepted, and rejected rows.
7. LOOK FOR: Require `input = accepted + rejected` unless the contract documents a separate deduplication accounting category.
8. PRESS: Run edge-case tests for null, whitespace, malformed date, duplicate business key, negative amount/quantity, and unknown reference as applicable.
9. DO NOT CONTINUE UNTIL: Counts reconcile and the expected dirty fixture produces the expected outcome.

Command or code:

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

Where to enter it:

Databricks workspace in a web browser. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

What each part means:

1. CLICK: Open the Silver notebook responsible for `inventory_transactions`.
2. LOOK FOR: Display a dirty Bronze example before writing a cleaning rule.
3. TYPE THIS: Add one explicit rule for the problem, including a rejection reason when the row is not accepted.
4. PRESS: Run the rule against the current batch only.
5. LOOK FOR: Display accepted and rejected examples side by side.
6. PRESS: Count Bronze input, Silver accepted, and rejected rows.
7. LOOK FOR: Require `input = accepted + rejected` unless the contract documents a separate deduplication accounting category.
8. PRESS: Run edge-case tests for null, whitespace, malformed date, duplicate business key, negative amount/quantity, and unknown reference as applicable.
9. DO NOT CONTINUE UNTIL: Counts reconcile and the expected dirty fixture produces the expected outcome.

What should happen:

A visible file, folder, branch, connection, table, notebook, task, relationship, measure, visual, or verification result should appear exactly where the action predicts.

Expected example:

Your exact values may differ. The expected result is the same *type* of object and the same required status, not necessarily the same timestamps, row counts, colors, generated IDs, or screen dimensions.

What may look different:

Menu wording can vary by product release or account tier. Use the official-source register and look for the described object rather than guessing from an old screenshot.

How to verify success:

Reopen or refresh the relevant panel, locate the named object, and inspect the property or output that proves it exists and is in the intended location.

Do not continue unless:

You can point to the visible result and explain what it proves. Mark the action VERIFIED BY USER only after that check.

Common mistake:

Combining several clicks or decisions, choosing a similarly named object, or continuing because no error dialog appeared.

Exact recovery:

Stop at the current screen. Save a screenshot of the error if useful, hide sensitive values, and compare the selected location with the starting condition. Use Back or Cancel rather than Delete or Overwrite. Correct one mismatch and repeat only this action.

What you just accomplished:

You completed one observable piece of the Northstar Retail platform and established a checkpoint that can be audited later.

How this connects to the project:

The resulting object, decision, or evidence becomes an input to the next stage in the source-to-consumption chain.

Edge-case test worksheet

- Actual Bronze rows: [ENTER COUNT]
- Accepted Silver rows: [ENTER COUNT]
- Rejected rows: [ENTER COUNT]
- Deduplicated-but-accounted rows: [ENTER COUNT OR 0]
- Reconciliation equation: [WRITE THE EQUATION AND RESULT]
- Controlled dirty fixture observed: [YES/NO + RULE ID]
- Rerun result for same batch: [ENTER RESULT]

Common error and recovery

If a cast turns invalid text into null, do not filter nulls without recording them. Add a pre-cast raw column or parse-valid flag, write a rejection reason, reconcile counts, and rerun the batch-scoped partition. If a duplicate rule chooses different survivors across runs, add deterministic tie-break columns and test the ordering.

Interview-ready explanation

"I built `silver.inventory_transactions` as a conformed entity with explicit acceptance and rejection rules. I demonstrated dirty input, validated edge cases, and reconciled every input row so cleaning could not silently remove data."

Silver entity 13 — `silver.inventory_snapshots`

Bronze input: `bronze.erp_inventory_snapshots`.

Silver grain: One accepted, conformed record at the entity grain defined by the source-to-target mapping.

Cleaning responsibility: trim, cast, standardize, deduplicate, validate, and quarantine.

Rejected output: Entity-specific rejection/quarantine rows with `_batch_id`, business key when available, rule ID, reason, offending value, and rejection timestamp.

Business impact: Incorrect cleaning can duplicate revenue, misidentify customers, lose history, overstate inventory, misattribute marketing, or hide late shipments.

Action 10.4.SV13 — Build and test `silver.inventory_snapshots`

Application:

Databricks workspace in a web browser

Window or panel:

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

Starting condition:

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Build and test `silver.inventory_snapshots`. This is one bounded construction or inspection task.

Why this action comes now:

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

Exact physical actions:

1. CLICK: Open the Silver notebook responsible for `inventory_snapshots`.
2. LOOK FOR: Display a dirty Bronze example before writing a cleaning rule.
3. TYPE THIS: Add one explicit rule for the problem, including a rejection reason when the row is not accepted.
4. PRESS: Run the rule against the current batch only.
5. LOOK FOR: Display accepted and rejected examples side by side.
6. PRESS: Count Bronze input, Silver accepted, and rejected rows.
7. LOOK FOR: Require `input = accepted + rejected` unless the contract documents a separate deduplication accounting category.
8. PRESS: Run edge-case tests for null, whitespace, malformed date, duplicate business key, negative amount/quantity, and unknown reference as applicable.
9. DO NOT CONTINUE UNTIL: Counts reconcile and the expected dirty fixture produces the expected outcome.

Command or code:

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

Where to enter it:

Databricks workspace in a web browser. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

What each part means:

1. CLICK: Open the Silver notebook responsible for `inventory_snapshots`.
2. LOOK FOR: Display a dirty Bronze example before writing a cleaning rule.
3. TYPE THIS: Add one explicit rule for the problem, including a rejection reason when the row is not accepted.
4. PRESS: Run the rule against the current batch only.
5. LOOK FOR: Display accepted and rejected examples side by side.
6. PRESS: Count Bronze input, Silver accepted, and rejected rows.
7. LOOK FOR: Require `input = accepted + rejected` unless the contract documents a separate deduplication accounting category.
8. PRESS: Run edge-case tests for null, whitespace, malformed date, duplicate business key, negative amount/quantity, and unknown reference as applicable.
9. DO NOT CONTINUE UNTIL: Counts reconcile and the expected dirty fixture produces the expected outcome.

What should happen:

A visible file, folder, branch, connection, table, notebook, task, relationship, measure, visual, or verification result should appear exactly where the action predicts.

Expected example:

Your exact values may differ. The expected result is the same *type* of object and the same required status, not necessarily the same timestamps, row counts, colors, generated IDs, or screen dimensions.

What may look different:

Menu wording can vary by product release or account tier. Use the official-source register and look for the described object rather than guessing from an old screenshot.

How to verify success:

Reopen or refresh the relevant panel, locate the named object, and inspect the property or output that proves it exists and is in the intended location.

Do not continue unless:

You can point to the visible result and explain what it proves. Mark the action VERIFIED BY USER only after that check.

Common mistake:

Combining several clicks or decisions, choosing a similarly named object, or continuing because no error dialog appeared.

Exact recovery:

Stop at the current screen. Save a screenshot of the error if useful, hide sensitive values, and compare the selected location with the starting condition. Use Back or Cancel rather than Delete or Overwrite. Correct one mismatch and repeat only this action.

What you just accomplished:

You completed one observable piece of the Northstar Retail platform and established a checkpoint that can be audited later.

How this connects to the project:

The resulting object, decision, or evidence becomes an input to the next stage in the source-to-consumption chain.

[Back to the Phase 10 lesson index](#)

Dirty input → rule → expected outputs

Scenario	Dirty input example	Rule	Accepted output	Rejected output	Count expectation
Whitespace/case	padded or mixed-case code	trim and standardize governed code	normalized value	none when otherwise valid	one input becomes one accepted row
Invalid required value	null, malformed, or impossible value	validate business and type rule	none	original value plus reason	one input becomes one rejected row
Duplicate business key	two candidate rows	deterministic ordering and survivor rule	one survivor	duplicate/reconciliation record	input count remains explainable

Scenario	Dirty input example	Rule	Accepted output	Rejected output	Count expectation
Unknown reference	key absent from conformed parent	preserve for unknown-key handling or reject per contract	explicit unknown handling	monitored exception if policy requires	no silent row loss
Date boundary	end before start or impossible timestamp	compare parsed dates	corrected only when rule permits	otherwise reject	no coerced nonsense dates

Teaching code section

```
source_df = spark.table(f"{catalog}.bronze.erp_inventory_snapshots")
standardized_df = source_df.select(
    "*",
    F.trim(F.col(source_df.columns[0]).cast("string")).alias("_example_standardized_key")
)
valid_df = standardized_df.filter(F.col("_batch_id") == batch_id)
rejected_df = standardized_df.subtract(valid_df)
(valid_df.write.format("delta").mode("overwrite")
.option("replaceWhere", f"_batch_id = '{batch_id}'")
.saveAsTable(f"{catalog}.silver.inventory_snapshots"))
```

Common error and recovery

If a cast turns invalid text into null, do not filter nulls without recording them. Add a pre-cast raw column or parse-valid flag, write a rejection reason, reconcile counts, and rerun the batch-scoped partition. If a duplicate rule chooses different survivors across runs, add deterministic tie-break columns and test the ordering.

Interview-ready explanation

"I built `silver.inventory_snapshots` as a conformed entity with explicit acceptance and rejection rules. I demonstrated dirty input, validated edge cases, and reconciled every input row so cleaning could not silently remove data."

Silver entity 14 — `silver.web_users`

Bronze input: `bronze.digital_web_users`.

Silver grain: One accepted, conformed record at the entity grain defined by the source-to-target mapping.

Cleaning responsibility: trim, cast, standardize, deduplicate, validate, and quarantine.

Rejected output: Entity-specific rejection/quarantine rows with `_batch_id`, business key when available, rule ID, reason, of-fending value, and rejection timestamp.

Business impact: Incorrect cleaning can duplicate revenue, misidentify customers, lose history, overstate inventory, misattribute marketing, or hide late shipments.

Action 10.4.SV14 — Build and test `silver.web_users`

Application:

Databricks workspace in a web browser

Window or panel:

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

Starting condition:

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Build and test `silver.web_users`. This is one bounded construction or inspection task.

Why this action comes now:

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

Exact physical actions:

1. CLICK: Open the Silver notebook responsible for `web_users`.
2. LOOK FOR: Display a dirty Bronze example before writing a cleaning rule.
3. TYPE THIS: Add one explicit rule for the problem, including a rejection reason when the row is not accepted.
4. PRESS: Run the rule against the current batch only.
5. LOOK FOR: Display accepted and rejected examples side by side.
6. PRESS: Count Bronze input, Silver accepted, and rejected rows.
7. LOOK FOR: Require `input = accepted + rejected` unless the contract documents a separate deduplication accounting category.
8. PRESS: Run edge-case tests for null, whitespace, malformed date, duplicate business key, negative amount/quantity, and unknown reference as applicable.
9. DO NOT CONTINUE UNTIL: Counts reconcile and the expected dirty fixture produces the expected outcome.

Command or code:

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

Where to enter it:

Databricks workspace in a web browser. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

Edge-case test worksheet

- Actual Bronze rows: [ENTER COUNT]
- Accepted Silver rows: [ENTER COUNT]
- Rejected rows: [ENTER COUNT]
- Deduplicated-but-accounted rows: [ENTER COUNT OR 0]
- Reconciliation equation: [WRITE THE EQUATION AND RESULT]
- Controlled dirty fixture observed: [YES/NO + RULE ID]
- Rerun result for same batch: [ENTER RESULT]

Common error and recovery

If a cast turns invalid text into null, do not filter nulls without recording them. Add a pre-cast raw column or parse-valid flag, write a rejection reason, reconcile counts, and rerun the batch-scoped partition. If a duplicate rule chooses different survivors across runs, add deterministic tie-break columns and test the ordering.

Interview-ready explanation

"I built `silver.web_users` as a conformed entity with explicit acceptance and rejection rules. I demonstrated dirty input, validated edge cases, and reconciled every input row so cleaning could not silently remove data."

Silver entity 15 — `silver.campaigns`

Bronze input: `bronze.digital_campaigns`.

Silver grain: One accepted, conformed record at the entity grain defined by the source-to-target mapping.

Cleaning responsibility: trim, cast, standardize, deduplicate, validate, and quarantine.

Rejected output: Entity-specific rejection/quarantine rows with `_batch_id`, business key when available, rule ID, reason, offending value, and rejection timestamp.

Business impact: Incorrect cleaning can duplicate revenue, misidentify customers, lose history, overstate inventory, misattribute marketing, or hide late shipments.

Action 10.4.SV15 — Build and test `silver.campaigns`

Application:

Databricks workspace in a web browser

Window or panel:

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

Starting condition:

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Build and test `silver.campaigns`. This is one bounded construction or inspection task.

Why this action comes now:

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

Exact physical actions:

1. CLICK: Open the Silver notebook responsible for campaigns.
2. LOOK FOR: Display a dirty Bronze example before writing a cleaning rule.
3. TYPE THIS: Add one explicit rule for the problem, including a rejection reason when the row is not accepted.
4. PRESS: Run the rule against the current batch only.
5. LOOK FOR: Display accepted and rejected examples side by side.
6. PRESS: Count Bronze input, Silver accepted, and rejected rows.
7. LOOK FOR: Require `input = accepted + rejected` unless the contract documents a separate deduplication accounting category.
8. PRESS: Run edge-case tests for null, whitespace, malformed date, duplicate business key, negative amount/quantity, and unknown reference as applicable.
9. DO NOT CONTINUE UNTIL: Counts reconcile and the expected dirty fixture produces the expected outcome.

Command or code:

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

Where to enter it:

Databricks workspace in a web browser. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

What each part means:

1. CLICK: Open the Silver notebook responsible for campaigns.
2. LOOK FOR: Display a dirty Bronze example before writing a cleaning rule.
3. TYPE THIS: Add one explicit rule for the problem, including a rejection reason when the row is not accepted.
4. PRESS: Run the rule against the current batch only.
5. LOOK FOR: Display accepted and rejected examples side by side.
6. PRESS: Count Bronze input, Silver accepted, and rejected rows.
7. LOOK FOR: Require `input = accepted + rejected` unless the contract documents a separate deduplication accounting category.
8. PRESS: Run edge-case tests for null, whitespace, malformed date, duplicate business key, negative amount/quantity, and unknown reference as applicable.
9. DO NOT CONTINUE UNTIL: Counts reconcile and the expected dirty fixture produces the expected outcome.

What should happen:

A visible file, folder, branch, connection, table, notebook, task, relationship, measure, visual, or verification result should appear exactly where the action predicts.

Expected example:

Your exact values may differ. The expected result is the same *type* of object and the same required status, not necessarily the same timestamps, row counts, colors, generated IDs, or screen dimensions.

What may look different:

Menu wording can vary by product release or account tier. Use the official-source register and look for the described object rather than guessing from an old screenshot.

How to verify success:

Reopen or refresh the relevant panel, locate the named object, and inspect the property or output that proves it exists and is in the intended location.

Do not continue unless:

You can point to the visible result and explain what it proves. Mark the action VERIFIED BY USER only after that check.

Common mistake:

Combining several clicks or decisions, choosing a similarly named object, or continuing because no error dialog appeared.

Exact recovery:

Stop at the current screen. Save a screenshot of the error if useful, hide sensitive values, and compare the selected location with the starting condition. Use Back or Cancel rather than Delete or Overwrite. Correct one mismatch and repeat only this action.

What you just accomplished:

You completed one observable piece of the Northstar Retail platform and established a checkpoint that can be audited later.

How this connects to the project:

The resulting object, decision, or evidence becomes an input to the next stage in the source-to-consumption chain.

Dirty input → rule → expected outputs

Scenario	Dirty input example	Rule	Accepted output	Rejected output	Count expectation
Whitespace/case	padded or mixed-case code	trim and standardize governed code	normalized value	none when otherwise valid	one input becomes one accepted row
Invalid required value	null, malformed, or impossible value	validate business and type rule	none	original value plus reason	one input becomes one rejected row
Duplicate business key	two candidate rows	deterministic ordering and survivor rule	one survivor	duplicate/reconciliation record	input count remains explainable
Unknown reference	key absent from conformed parent	preserve for unknown-key handling or reject per contract	explicit unknown handling	monitored exception if policy requires	no silent row loss
Date boundary	end before start or impossible timestamp	compare parsed dates	corrected only when rule permits	otherwise reject	no coerced nonsense dates

Teaching code section

```
source_df = spark.table(f"{catalog}.bronze.digital_campaigns")
standardized_df = source_df.select(
    "*",
    F.trim(F.col(source_df.columns[0]).cast("string")).alias("_example_standardized_key")
)
valid_df = standardized_df.filter(F.col("_batch_id") == batch_id)
rejected_df = standardized_df.subtract(valid_df)
(valid_df.write.format("delta").mode("overwrite")
 .option("replaceWhere", f"_batch_id = '{batch_id}'")
 .saveAsTable(f"{catalog}.silver.campaigns"))
```

- **Line 9:** `.option("replaceWhere", f"_batch_id = '{batch_id}')` — `.` is a path, relative location, branch-style name, or file argument; verify every character before running it; `option` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `(` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `"replaceWhere"` is a quoted literal; the quotation marks preserve spaces or mark text; `,` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `f` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `"_batch_id = '{batch_id}'"` is a quoted literal; the quotation marks preserve spaces or mark text; `)` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation
- **Line 10:** `.saveAsTable(f"{catalog}.silver.web_sessions"))` — `.` is a path, relative location, branch-style name, or file argument; verify every character before running it; `saveAsTable` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `(` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `f` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `"{catalog}.silver.web_sessions"` is a quoted literal; the quotation marks preserve spaces or mark text; `)` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation

Edge-case test worksheet

- Actual Bronze rows: [ENTER COUNT]
- Accepted Silver rows: [ENTER COUNT]
- Rejected rows: [ENTER COUNT]
- Deduplicated-but-accounted rows: [ENTER COUNT OR 0]
- Reconciliation equation: [WRITE THE EQUATION AND RESULT]
- Controlled dirty fixture observed: [YES/NO + RULE ID]
- Rerun result for same batch: [ENTER RESULT]

Common error and recovery

If a cast turns invalid text into null, do not filter nulls without recording them. Add a pre-cast raw column or parse-valid flag, write a rejection reason, reconcile counts, and rerun the batch-scoped partition. If a duplicate rule chooses different survivors across runs, add deterministic tie-break columns and test the ordering.

Interview-ready explanation

"I built `silver.web_sessions` as a conformed entity with explicit acceptance and rejection rules. I demonstrated dirty input, validated edge cases, and reconciled every input row so cleaning could not silently remove data."

Silver entity 17 — `silver.web_events`

Bronze input: `bronze.digital_web_events`.

Silver grain: One accepted, conformed record at the entity grain defined by the source-to-target mapping.

Cleaning responsibility: trim, cast, standardize, deduplicate, validate, and quarantine.

Rejected output: Entity-specific rejection/quarantine rows with `_batch_id`, business key when available, rule ID, reason, offsetting value, and rejection timestamp.

Business impact: Incorrect cleaning can duplicate revenue, misidentify customers, lose history, overstate inventory, misattribute marketing, or hide late shipments.

Action 10.4.SV17 — Build and test `silver.web_events`

Application:

Databricks workspace in a web browser

Window or panel:

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

Starting condition:

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Build and test `silver.web_events`. This is one bounded construction or inspection task.

Why this action comes now:

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

Exact physical actions:

1. CLICK: Open the Silver notebook responsible for `web_events`.
2. LOOK FOR: Display a dirty Bronze example before writing a cleaning rule.
3. TYPE THIS: Add one explicit rule for the problem, including a rejection reason when the row is not accepted.
4. PRESS: Run the rule against the current batch only.
5. LOOK FOR: Display accepted and rejected examples side by side.
6. PRESS: Count Bronze input, Silver accepted, and rejected rows.
7. LOOK FOR: Require `input = accepted + rejected` unless the contract documents a separate deduplication accounting category.
8. PRESS: Run edge-case tests for null, whitespace, malformed date, duplicate business key, negative amount/quantity, and unknown reference as applicable.
9. DO NOT CONTINUE UNTIL: Counts reconcile and the expected dirty fixture produces the expected outcome.

Command or code:

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

Where to enter it:

Databricks workspace in a web browser. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

What each part means:

1. CLICK: Open the Silver notebook responsible for `web_events`.
2. LOOK FOR: Display a dirty Bronze example before writing a cleaning rule.
3. TYPE THIS: Add one explicit rule for the problem, including a rejection reason when the row is not accepted.
4. PRESS: Run the rule against the current batch only.
5. LOOK FOR: Display accepted and rejected examples side by side.
6. PRESS: Count Bronze input, Silver accepted, and rejected rows.
7. LOOK FOR: Require `input = accepted + rejected` unless the contract documents a separate deduplication accounting category.
8. PRESS: Run edge-case tests for null, whitespace, malformed date, duplicate business key, negative amount/quantity, and unknown reference as applicable.
9. DO NOT CONTINUE UNTIL: Counts reconcile and the expected dirty fixture produces the expected outcome.

What should happen:

A visible file, folder, branch, connection, table, notebook, task, relationship, measure, visual, or verification result should appear exactly where the action predicts.

Expected example:

Your exact values may differ. The expected result is the same *type* of object and the same required status, not necessarily the same timestamps, row counts, colors, generated IDs, or screen dimensions.

What may look different:

Menu wording can vary by product release or account tier. Use the official-source register and look for the described object rather than guessing from an old screenshot.

How to verify success:

Reopen or refresh the relevant panel, locate the named object, and inspect the property or output that proves it exists and is in the intended location.

Do not continue unless:

You can point to the visible result and explain what it proves. Mark the action VERIFIED BY USER only after that check.

Common mistake:

Combining several clicks or decisions, choosing a similarly named object, or continuing because no error dialog appeared.

Exact recovery:

Stop at the current screen. Save a screenshot of the error if useful, hide sensitive values, and compare the selected location with the starting condition. Use Back or Cancel rather than Delete or Overwrite. Correct one mismatch and repeat only this action.

What you just accomplished:

You completed one observable piece of the Northstar Retail platform and established a checkpoint that can be audited later.

How this connects to the project:

The resulting object, decision, or evidence becomes an input to the next stage in the source-to-consumption chain.

[Back to the Phase 10 lesson index](#)

Dirty input → rule → expected outputs

Scenario	Dirty input example	Rule	Accepted output	Rejected output	Count expectation
Whitespace/case	padded or mixed-case code	trim and standardize governed code	normalized value	none when otherwise valid	one input becomes one accepted row
Invalid required value	null, malformed, or impossible value	validate business and type rule	none	original value plus reason	one input becomes one rejected row
Duplicate business key	two candidate rows	deterministic ordering and survivor rule	one survivor	duplicate/reconciliation record	input count remains explainable
Unknown reference	key absent from conformed parent	preserve for unknown-key handling or reject per contract	explicit unknown handling	monitored exception if policy requires	no silent row loss
Date boundary	end before start or impossible timestamp	compare parsed dates	corrected only when rule permits	otherwise reject	no coerced nonsense dates

Teaching code section

```
source_df = spark.table(f"{catalog}.bronze.digital_web_events")
standardized_df = source_df.select(
    "*",
    F.trim(F.col(source_df.columns[0]).cast("string")).alias("_example_standardized_key")
)
valid_df = standardized_df.filter(F.col("_batch_id") == batch_id)
rejected_df = standardized_df.subtract(valid_df)
(valid_df.write.format("delta").mode("overwrite")
    .option("replaceWhere", f"_batch_id = '{batch_id}'")
    .saveAsTable(f"{catalog}.silver.web_events"))
```

Common error and recovery

If a cast turns invalid text into null, do not filter nulls without recording them. Add a pre-cast raw column or parse-valid flag, write a rejection reason, reconcile counts, and rerun the batch-scoped partition. If a duplicate rule chooses different survivors across runs, add deterministic tie-break columns and test the ordering.

Interview-ready explanation

"I built `silver.web_events` as a conformed entity with explicit acceptance and rejection rules. I demonstrated dirty input, validated edge cases, and reconciled every input row so cleaning could not silently remove data."

Silver entity 18 — `silver.campaign_touchpoints`

Bronze input: `bronze.digital_campaign_touchpoints`.

Silver grain: One accepted, conformed record at the entity grain defined by the source-to-target mapping.

Cleaning responsibility: trim, cast, standardize, deduplicate, validate, and quarantine.

Rejected output: Entity-specific rejection/quarantine rows with `_batch_id`, business key when available, rule ID, reason, offending value, and rejection timestamp.

Business impact: Incorrect cleaning can duplicate revenue, misidentify customers, lose history, overstate inventory, misattribute marketing, or hide late shipments.

Action 10.4.SV18 — Build and test `silver.campaign_touchpoints`

Application:

Databricks workspace in a web browser

Window or panel:

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

Starting condition:

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Build and test `silver.campaign_touchpoints`. This is one bounded construction or inspection task.

Why this action comes now:

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

Exact physical actions:

1. CLICK: Open the Silver notebook responsible for `campaign_touchpoints`.

2. LOOK FOR: Display a dirty Bronze example before writing a cleaning rule.
3. TYPE THIS: Add one explicit rule for the problem, including a rejection reason when the row is not accepted.
4. PRESS: Run the rule against the current batch only.
5. LOOK FOR: Display accepted and rejected examples side by side.
6. PRESS: Count Bronze input, Silver accepted, and rejected rows.
7. LOOK FOR: Require input = accepted + rejected unless the contract documents a separate deduplication accounting category.
8. PRESS: Run edge-case tests for null, whitespace, malformed date, duplicate business key, negative amount/quantity, and unknown reference as applicable.
9. DO NOT CONTINUE UNTIL: Counts reconcile and the expected dirty fixture produces the expected outcome.

Command or code:

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

Where to enter it:

Databricks workspace in a web browser. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

What each part means:

1. CLICK: Open the Silver notebook responsible for campaign_touchpoints.
2. LOOK FOR: Display a dirty Bronze example before writing a cleaning rule.
3. TYPE THIS: Add one explicit rule for the problem, including a rejection reason when the row is not accepted.
4. PRESS: Run the rule against the current batch only.
5. LOOK FOR: Display accepted and rejected examples side by side.
6. PRESS: Count Bronze input, Silver accepted, and rejected rows.
7. LOOK FOR: Require input = accepted + rejected unless the contract documents a separate deduplication accounting category.
8. PRESS: Run edge-case tests for null, whitespace, malformed date, duplicate business key, negative amount/quantity, and unknown reference as applicable.
9. DO NOT CONTINUE UNTIL: Counts reconcile and the expected dirty fixture produces the expected outcome.

What should happen:

A visible file, folder, branch, connection, table, notebook, task, relationship, measure, visual, or verification result should appear exactly where the action predicts.

Expected example:

Your exact values may differ. The expected result is the same *type* of object and the same required status, not necessarily the same timestamps, row counts, colors, generated IDs, or screen dimensions.

What may look different:

Menu wording can vary by product release or account tier. Use the official-source register and look for the described object rather than guessing from an old screenshot.

How to verify success:

Reopen or refresh the relevant panel, locate the named object, and inspect the property or output that proves it exists and is in the intended location.

Do not continue unless:

You can point to the visible result and explain what it proves. Mark the action VERIFIED BY USER only after that check.

Common mistake:

Combining several clicks or decisions, choosing a similarly named object, or continuing because no error dialog appeared.

Exact recovery:

Stop at the current screen. Save a screenshot of the error if useful, hide sensitive values, and compare the selected location with the starting condition. Use Back or Cancel rather than Delete or Overwrite. Correct one mismatch and repeat only this action.

What you just accomplished:

You completed one observable piece of the Northstar Retail platform and established a checkpoint that can be audited later.

How this connects to the project:

The resulting object, decision, or evidence becomes an input to the next stage in the source-to-consumption chain.

- **Line 10:** `.saveAsTable(f"{catalog}.silver.campaign_touchpoints"))` — `.` is a path, relative location, branch-style name, or file argument; verify every character before running it; `saveAsTable` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `(` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `f` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `"{catalog}.silver.campaign_touchpoints"` is a quoted literal; the quotation marks preserve spaces or mark text; `)` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation

Edge-case test worksheet

- Actual Bronze rows: [ENTER COUNT]
- Accepted Silver rows: [ENTER COUNT]
- Rejected rows: [ENTER COUNT]
- Deduplicated-but-accounted rows: [ENTER COUNT OR 0]
- Reconciliation equation: [WRITE THE EQUATION AND RESULT]
- Controlled dirty fixture observed: [YES/NO + RULE ID]
- Rerun result for same batch: [ENTER RESULT]

Common error and recovery

If a cast turns invalid text into null, do not filter nulls without recording them. Add a pre-cast raw column or parse-valid flag, write a rejection reason, reconcile counts, and rerun the batch-scoped partition. If a duplicate rule chooses different survivors across runs, add deterministic tie-break columns and test the ordering.

Interview-ready explanation

"I built `silver.campaign_touchpoints` as a conformed entity with explicit acceptance and rejection rules. I demonstrated dirty input, validated edge cases, and reconciled every input row so cleaning could not silently remove data."

Silver entity 19 — `silver.marketing_spend`

Bronze input: `bronze.digital_marketing_spend`.

Silver grain: One accepted, conformed record at the entity grain defined by the source-to-target mapping.

Cleaning responsibility: trim, cast, standardize, deduplicate, validate, and quarantine.

Rejected output: Entity-specific rejection/quarantine rows with `_batch_id`, business key when available, rule ID, reason, offending value, and rejection timestamp.

Business impact: Incorrect cleaning can duplicate revenue, misidentify customers, lose history, overstate inventory, misattribute marketing, or hide late shipments.

Action 10.4.SV19 — Build and test `silver.marketing_spend`

Application:

Databricks workspace in a web browser

Window or panel:

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

Starting condition:

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Build and test `silver.marketing_spend`. This is one bounded construction or inspection task.

Why this action comes now:

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

Exact physical actions:

1. CLICK: Open the Silver notebook responsible for `marketing_spend`.
2. LOOK FOR: Display a dirty Bronze example before writing a cleaning rule.
3. TYPE THIS: Add one explicit rule for the problem, including a rejection reason when the row is not accepted.
4. PRESS: Run the rule against the current batch only.
5. LOOK FOR: Display accepted and rejected examples side by side.
6. PRESS: Count Bronze input, Silver accepted, and rejected rows.
7. LOOK FOR: Require `input = accepted + rejected` unless the contract documents a separate deduplication accounting category.
8. PRESS: Run edge-case tests for null, whitespace, malformed date, duplicate business key, negative amount/quantity, and unknown reference as applicable.
9. DO NOT CONTINUE UNTIL: Counts reconcile and the expected dirty fixture produces the expected outcome.

Command or code:

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

Where to enter it:

Databricks workspace in a web browser. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

What each part means:

1. CLICK: Open the Silver notebook responsible for `marketing_spend`.

2. LOOK FOR: Display a dirty Bronze example before writing a cleaning rule.
3. TYPE THIS: Add one explicit rule for the problem, including a rejection reason when the row is not accepted.
4. PRESS: Run the rule against the current batch only.
5. LOOK FOR: Display accepted and rejected examples side by side.
6. PRESS: Count Bronze input, Silver accepted, and rejected rows.
7. LOOK FOR: Require input = accepted + rejected unless the contract documents a separate deduplication accounting category.
8. PRESS: Run edge-case tests for null, whitespace, malformed date, duplicate business key, negative amount/quantity, and unknown reference as applicable.
9. DO NOT CONTINUE UNTIL: Counts reconcile and the expected dirty fixture produces the expected outcome.

What should happen:

A visible file, folder, branch, connection, table, notebook, task, relationship, measure, visual, or verification result should appear exactly where the action predicts.

Expected example:

Your exact values may differ. The expected result is the same *type* of object and the same required status, not necessarily the same timestamps, row counts, colors, generated IDs, or screen dimensions.

What may look different:

Menu wording can vary by product release or account tier. Use the official-source register and look for the described object rather than guessing from an old screenshot.

How to verify success:

Reopen or refresh the relevant panel, locate the named object, and inspect the property or output that proves it exists and is in the intended location.

Do not continue unless:

You can point to the visible result and explain what it proves. Mark the action VERIFIED BY USER only after that check.

Common mistake:

Combining several clicks or decisions, choosing a similarly named object, or continuing because no error dialog appeared.

Exact recovery:

Stop at the current screen. Save a screenshot of the error if useful, hide sensitive values, and compare the selected location with the starting condition. Use Back or Cancel rather than Delete or Overwrite. Correct one mismatch and repeat only this action.

What you just accomplished:

You completed one observable piece of the Northstar Retail platform and established a checkpoint that can be audited later.

How this connects to the project:

The resulting object, decision, or evidence becomes an input to the next stage in the source-to-consumption chain.

Dirty input → rule → expected outputs

Scenario	Dirty input example	Rule	Accepted output	Rejected output	Count expectation
Whitespace/case	padded or mixed-case code	trim and standardize governed code	normalized value	none when otherwise valid	one input becomes one accepted row
Invalid required value	null, malformed, or impossible value	validate business and type rule	none	original value plus reason	one input becomes one rejected row
Duplicate business key	two candidate rows	deterministic ordering and survivor rule	one survivor	duplicate/reconciliation record	input count remains explainable
Unknown reference	key absent from conformed parent	preserve for unknown-key handling or reject per contract	explicit unknown handling	monitored exception if policy requires	no silent row loss
Date boundary	end before start or impossible timestamp	compare parsed dates	corrected only when rule permits	otherwise reject	no coerced nonsense dates

Teaching code section

```
source_df = spark.table(f"{catalog}.bronze.digital_marketing_spend")
standardized_df = source_df.select(
    "*",
    F.trim(F.col(source_df.columns[0]).cast("string")).alias("_example_standardized_key")
)
```

```

)
valid_df = standardized_df.filter(F.col("_batch_id") == batch_id)
rejected_df = standardized_df.subtract(valid_df)
(valid_df.write.format("delta").mode("overwrite")
.option("replaceWhere", f"_batch_id = '{batch_id}'")
.saveAsTable(f"{catalog}.silver.marketing_spend"))

```

Common error and recovery

If a cast turns invalid text into null, do not filter nulls without recording them. Add a pre-cast raw column or parse-valid flag, write a rejection reason, reconcile counts, and rerun the batch-scoped partition. If a duplicate rule chooses different survivors across runs, add deterministic tie-break columns and test the ordering.

Interview-ready explanation

"I built `silver.marketing_spend` as a conformed entity with explicit acceptance and rejection rules. I demonstrated dirty input, validated edge cases, and reconciled every input row so cleaning could not silently remove data."

Silver entity 20 — `silver.returns`

Bronze input: `bronze.file_returns`.

Silver grain: One accepted, conformed record at the entity grain defined by the source-to-target mapping.

Cleaning responsibility: trim, cast, standardize, deduplicate, validate, and quarantine.

Rejected output: Entity-specific rejection/quarantine rows with `_batch_id`, business key when available, rule ID, reason, of-fending value, and rejection timestamp.

Business impact: Incorrect cleaning can duplicate revenue, misidentify customers, lose history, overstate inventory, misattribute marketing, or hide late shipments.

Action 10.4.SV20 — Build and test `silver.returns`

Application:

Databricks workspace in a web browser

Window or panel:

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

Starting condition:

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Build and test `silver_returns`. This is one bounded construction or inspection task.

Why this action comes now:

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

Exact physical actions:

1. CLICK: Open the Silver notebook responsible for returns.
2. LOOK FOR: Display a dirty Bronze example before writing a cleaning rule.
3. TYPE THIS: Add one explicit rule for the problem, including a rejection reason when the row is not accepted.
4. PRESS: Run the rule against the current batch only.
5. LOOK FOR: Display accepted and rejected examples side by side.
6. PRESS: Count Bronze input, Silver accepted, and rejected rows.
7. LOOK FOR: Require input = accepted + rejected unless the contract documents a separate deduplication accounting category.
8. PRESS: Run edge-case tests for null, whitespace, malformed date, duplicate business key, negative amount/quantity, and unknown reference as applicable.
9. DO NOT CONTINUE UNTIL: Counts reconcile and the expected dirty fixture produces the expected outcome.

Command or code:

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

Where to enter it:

Databricks workspace in a web browser. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

What each part means:

1. CLICK: Open the Silver notebook responsible for returns.
2. LOOK FOR: Display a dirty Bronze example before writing a cleaning rule.
3. TYPE THIS: Add one explicit rule for the problem, including a rejection reason when the row is not accepted.
4. PRESS: Run the rule against the current batch only.
5. LOOK FOR: Display accepted and rejected examples side by side.
6. PRESS: Count Bronze input, Silver accepted, and rejected rows.
7. LOOK FOR: Require input = accepted + rejected unless the contract documents a separate deduplication accounting category.
8. PRESS: Run edge-case tests for null, whitespace, malformed date, duplicate business key, negative amount/quantity, and unknown reference as applicable.
9. DO NOT CONTINUE UNTIL: Counts reconcile and the expected dirty fixture produces the expected outcome.

What should happen:

A visible file, folder, branch, connection, table, notebook, task, relationship, measure, visual, or verification result should appear exactly where the action predicts.

Expected example:

Your exact values may differ. The expected result is the same *type* of object and the same required status, not necessarily the same timestamps, row counts, colors, generated IDs, or screen dimensions.

fier, or literal whose project-specific role is described in the surrounding explanation; "{catalog}.silver.returns" is a quoted literal; the quotation marks preserve spaces or mark text;)) is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation

Edge-case test worksheet

- Actual Bronze rows: [ENTER COUNT]
- Accepted Silver rows: [ENTER COUNT]
- Rejected rows: [ENTER COUNT]
- Deduplicated-but-accounted rows: [ENTER COUNT OR 0]
- Reconciliation equation: [WRITE THE EQUATION AND RESULT]
- Controlled dirty fixture observed: [YES/NO + RULE ID]
- Rerun result for same batch: [ENTER RESULT]

Common error and recovery

If a cast turns invalid text into null, do not filter nulls without recording them. Add a pre-cast raw column or parse-valid flag, write a rejection reason, reconcile counts, and rerun the batch-scoped partition. If a duplicate rule chooses different survivors across runs, add deterministic tie-break columns and test the ordering.

Interview-ready explanation

"I built `silver.returns` as a conformed entity with explicit acceptance and rejection rules. I demonstrated dirty input, validated edge cases, and reconciled every input row so cleaning could not silently remove data."

Silver entity 21 — `silver.supplier_cost_updates`

Bronze input: `bronze.file_supplier_cost_updates`.

Silver grain: One accepted, conformed record at the entity grain defined by the source-to-target mapping.

Cleaning responsibility: trim, cast, standardize, deduplicate, validate, and quarantine.

Rejected output: Entity-specific rejection/quarantine rows with `_batch_id`, business key when available, rule ID, reason, offending value, and rejection timestamp.

Business impact: Incorrect cleaning can duplicate revenue, misidentify customers, lose history, overstate inventory, misattribute marketing, or hide late shipments.

Action 10.4.SV21 — Build and test `silver.supplier_cost_updates`

Application:

Databricks workspace in a web browser

Window or panel:

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

Starting condition:

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Build and test `silver.supplier_cost_updates`. This is one bounded construction or inspection task.

Why this action comes now:

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

Exact physical actions:

1. CLICK: Open the Silver notebook responsible for `supplier_cost_updates`.
2. LOOK FOR: Display a dirty Bronze example before writing a cleaning rule.
3. TYPE THIS: Add one explicit rule for the problem, including a rejection reason when the row is not accepted.
4. PRESS: Run the rule against the current batch only.
5. LOOK FOR: Display accepted and rejected examples side by side.
6. PRESS: Count Bronze input, Silver accepted, and rejected rows.

7. LOOK FOR: Require input = accepted + rejected unless the contract documents a separate deduplication accounting category.
8. PRESS: Run edge-case tests for null, whitespace, malformed date, duplicate business key, negative amount/quantity, and unknown reference as applicable.
9. DO NOT CONTINUE UNTIL: Counts reconcile and the expected dirty fixture produces the expected outcome.

Command or code:

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

Where to enter it:

Databricks workspace in a web browser. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

What each part means:

1. CLICK: Open the Silver notebook responsible for `supplier_cost_updates`.
2. LOOK FOR: Display a dirty Bronze example before writing a cleaning rule.
3. TYPE THIS: Add one explicit rule for the problem, including a rejection reason when the row is not accepted.
4. PRESS: Run the rule against the current batch only.
5. LOOK FOR: Display accepted and rejected examples side by side.
6. PRESS: Count Bronze input, Silver accepted, and rejected rows.
7. LOOK FOR: Require input = accepted + rejected unless the contract documents a separate deduplication accounting category.
8. PRESS: Run edge-case tests for null, whitespace, malformed date, duplicate business key, negative amount/quantity, and unknown reference as applicable.
9. DO NOT CONTINUE UNTIL: Counts reconcile and the expected dirty fixture produces the expected outcome.

What should happen:

A visible file, folder, branch, connection, table, notebook, task, relationship, measure, visual, or verification result should appear exactly where the action predicts.

Expected example:

Your exact values may differ. The expected result is the same *type* of object and the same required status, not necessarily the same timestamps, row counts, colors, generated IDs, or screen dimensions.

What may look different:

Menu wording can vary by product release or account tier. Use the official-source register and look for the described object rather than guessing from an old screenshot.

How to verify success:

Reopen or refresh the relevant panel, locate the named object, and inspect the property or output that proves it exists and is in the intended location.

Do not continue unless:

You can point to the visible result and explain what it proves. Mark the action VERIFIED BY USER only after that check.

Common mistake:

Combining several clicks or decisions, choosing a similarly named object, or continuing because no error dialog appeared.

Exact recovery:

Stop at the current screen. Save a screenshot of the error if useful, hide sensitive values, and compare the selected location with the starting condition. Use Back or Cancel rather than Delete or Overwrite. Correct one mismatch and repeat only this action.

What you just accomplished:

You completed one observable piece of the Northstar Retail platform and established a checkpoint that can be audited later.

How this connects to the project:

The resulting object, decision, or evidence becomes an input to the next stage in the source-to-consumption chain.

Dirty input → rule → expected outputs

Scenario	Dirty input example	Rule	Accepted output	Rejected output	Count expectation
Whitespace/case	padded or mixed-case code	trim and standardize governed code	normalized value	none when otherwise valid	one input becomes one accepted row
Invalid required value	null, malformed, or impossible value	validate business and type rule	none	original value plus reason	one input becomes one rejected row
Duplicate business key	two candidate rows	deterministic ordering and survivor rule	one survivor	duplicate/reconciliation record	input count remains explainable
Unknown reference	key absent from conformed parent	preserve for unknown-key handling or reject per contract	explicit unknown handling	monitored exception if policy requires	no silent row loss
Date boundary	end before start or impossible timestamp	compare parsed dates	corrected only when rule permits	otherwise reject	no coerced nonsense dates

Teaching code section

```
source_df = spark.table(f"{catalog}.bronze.file_supplier_cost_updates")
standardized_df = source_df.select(
    "*",
    F.trim(F.col(source_df.columns[0]).cast("string")).alias("_example_standardized_key")
)
valid_df = standardized_df.filter(F.col("_batch_id") == batch_id)
rejected_df = standardized_df.subtract(valid_df)
(valid_df.write.format("delta").mode("overwrite")
    .option("replaceWhere", f"_batch_id = '{batch_id}'")
    .saveAsTable(f"{catalog}.silver.supplier_cost_updates"))
```

Common error and recovery

If a cast turns invalid text into null, do not filter nulls without recording them. Add a pre-cast raw column or parse-valid flag, write a rejection reason, reconcile counts, and rerun the batch-scoped partition. If a duplicate rule chooses different survivors across runs, add deterministic tie-break columns and test the ordering.

Interview-ready explanation

"I built `silver.supplier_cost_updates` as a conformed entity with explicit acceptance and rejection rules. I demonstrated dirty input, validated edge cases, and reconciled every input row so cleaning could not silently remove data."

Silver entity 22 — `silver.promotion_calendar`

Bronze input: `bronze.file_promotion_calendar`.

Silver grain: One accepted, conformed record at the entity grain defined by the source-to-target mapping.

Cleaning responsibility: trim, cast, standardize, deduplicate, validate, and quarantine.

Rejected output: Entity-specific rejection/quarantine rows with `_batch_id`, business key when available, rule ID, reason, of-fending value, and rejection timestamp.

Business impact: Incorrect cleaning can duplicate revenue, misidentify customers, lose history, overstate inventory, misattribute marketing, or hide late shipments.

Action 10.4.SV22 — Build and test `silver.promotion_calendar`

Application:

Databricks workspace in a web browser

Window or panel:

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

Starting condition:

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Build and test `silver.promotion_calendar`. This is one bounded construction or inspection task.

Why this action comes now:

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

Exact physical actions:

1. CLICK: Open the Silver notebook responsible for `promotion_calendar`.
2. LOOK FOR: Display a dirty Bronze example before writing a cleaning rule.
3. TYPE THIS: Add one explicit rule for the problem, including a rejection reason when the row is not accepted.
4. PRESS: Run the rule against the current batch only.
5. LOOK FOR: Display accepted and rejected examples side by side.
6. PRESS: Count Bronze input, Silver accepted, and rejected rows.
7. LOOK FOR: Require `input = accepted + rejected` unless the contract documents a separate deduplication accounting category.
8. PRESS: Run edge-case tests for null, whitespace, malformed date, duplicate business key, negative amount/quantity, and unknown reference as applicable.
9. DO NOT CONTINUE UNTIL: Counts reconcile and the expected dirty fixture produces the expected outcome.

Command or code:

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

Where to enter it:

Databricks workspace in a web browser. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

What each part means:

1. CLICK: Open the Silver notebook responsible for `promotion_calendar`.
2. LOOK FOR: Display a dirty Bronze example before writing a cleaning rule.
3. TYPE THIS: Add one explicit rule for the problem, including a rejection reason when the row is not accepted.
4. PRESS: Run the rule against the current batch only.
5. LOOK FOR: Display accepted and rejected examples side by side.
6. PRESS: Count Bronze input, Silver accepted, and rejected rows.

7. LOOK FOR: Require input = accepted + rejected unless the contract documents a separate deduplication accounting category.
8. PRESS: Run edge-case tests for null, whitespace, malformed date, duplicate business key, negative amount/quantity, and unknown reference as applicable.
9. DO NOT CONTINUE UNTIL: Counts reconcile and the expected dirty fixture produces the expected outcome.

What should happen:

A visible file, folder, branch, connection, table, notebook, task, relationship, measure, visual, or verification result should appear exactly where the action predicts.

Edge-case test worksheet

- Actual Bronze rows: [ENTER COUNT]
- Accepted Silver rows: [ENTER COUNT]
- Rejected rows: [ENTER COUNT]
- Deduplicated-but-accounted rows: [ENTER COUNT OR 0]
- Reconciliation equation: [WRITE THE EQUATION AND RESULT]
- Controlled dirty fixture observed: [YES/NO + RULE ID]
- Rerun result for same batch: [ENTER RESULT]

Common error and recovery

If a cast turns invalid text into null, do not filter nulls without recording them. Add a pre-cast raw column or parse-valid flag, write a rejection reason, reconcile counts, and rerun the batch-scoped partition. If a duplicate rule chooses different survivors across runs, add deterministic tie-break columns and test the ordering.

Interview-ready explanation

"I built `silver.promotion_calendar` as a conformed entity with explicit acceptance and rejection rules. I demonstrated dirty input, validated edge cases, and reconciled every input row so cleaning could not silently remove data."

Silver entity 23 — `silver.shipment_tracking_events`

Bronze input: `bronze.file_shipment_tracking_events`.

Silver grain: One accepted, conformed record at the entity grain defined by the source-to-target mapping.

Cleaning responsibility: trim, cast, standardize, deduplicate, validate, and quarantine.

Rejected output: Entity-specific rejection/quarantine rows with `_batch_id`, business key when available, rule ID, reason, of-fending value, and rejection timestamp.

Business impact: Incorrect cleaning can duplicate revenue, misidentify customers, lose history, overstate inventory, misattribute marketing, or hide late shipments.

Action 10.4.SV23 — Build and test `silver.shipment_tracking_events`

Application:

Databricks workspace in a web browser

Window or panel:

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

Starting condition:

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Build and test `silver.shipment_tracking_events`. This is one bounded construction or inspection task.

Why this action comes now:

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

Exact physical actions:

1. CLICK: Open the Silver notebook responsible for `shipment_tracking_events`.
2. LOOK FOR: Display a dirty Bronze example before writing a cleaning rule.
3. TYPE THIS: Add one explicit rule for the problem, including a rejection reason when the row is not accepted.
4. PRESS: Run the rule against the current batch only.
5. LOOK FOR: Display accepted and rejected examples side by side.
6. PRESS: Count Bronze input, Silver accepted, and rejected rows.
7. LOOK FOR: Require `input = accepted + rejected` unless the contract documents a separate deduplication accounting category.
8. PRESS: Run edge-case tests for null, whitespace, malformed date, duplicate business key, negative amount/quantity, and unknown reference as applicable.
9. DO NOT CONTINUE UNTIL: Counts reconcile and the expected dirty fixture produces the expected outcome.

Command or code:

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

Where to enter it:

Databricks workspace in a web browser. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

What each part means:

1. CLICK: Open the Silver notebook responsible for `shipment_tracking_events`.
2. LOOK FOR: Display a dirty Bronze example before writing a cleaning rule.
3. TYPE THIS: Add one explicit rule for the problem, including a rejection reason when the row is not accepted.
4. PRESS: Run the rule against the current batch only.
5. LOOK FOR: Display accepted and rejected examples side by side.
6. PRESS: Count Bronze input, Silver accepted, and rejected rows.
7. LOOK FOR: Require `input = accepted + rejected` unless the contract documents a separate deduplication accounting category.
8. PRESS: Run edge-case tests for null, whitespace, malformed date, duplicate business key, negative amount/quantity, and unknown reference as applicable.
9. DO NOT CONTINUE UNTIL: Counts reconcile and the expected dirty fixture produces the expected outcome.

What should happen:

A visible file, folder, branch, connection, table, notebook, task, relationship, measure, visual, or verification result should appear exactly where the action predicts.

Expected example:

Your exact values may differ. The expected result is the same *type* of object and the same required status, not necessarily the same timestamps, row counts, colors, generated IDs, or screen dimensions.

What may look different:

Menu wording can vary by product release or account tier. Use the official-source register and look for the described object rather than guessing from an old screenshot.

How to verify success:

Reopen or refresh the relevant panel, locate the named object, and inspect the property or output that proves it exists and is in the intended location.

Do not continue unless:

You can point to the visible result and explain what it proves. Mark the action VERIFIED BY USER only after that check.

Common mistake:

Combining several clicks or decisions, choosing a similarly named object, or continuing because no error dialog appeared.

Exact recovery:

Stop at the current screen. Save a screenshot of the error if useful, hide sensitive values, and compare the selected location with the starting condition. Use Back or Cancel rather than Delete or Overwrite. Correct one mismatch and repeat only this action.

What you just accomplished:

You completed one observable piece of the Northstar Retail platform and established a checkpoint that can be audited later.

How this connects to the project:

The resulting object, decision, or evidence becomes an input to the next stage in the source-to-consumption chain.

Dirty input → rule → expected outputs

Scenario	Dirty input example	Rule	Accepted output	Rejected output	Count expectation
Whitespace/case	padded or mixed-case code	trim and standardize governed code	normalized value	none when otherwise valid	one input becomes one accepted row
Invalid required value	null, malformed, or impossible value	validate business and type rule	none	original value plus reason	one input becomes one rejected row
Duplicate business key	two candidate rows	deterministic ordering and survivor rule	one survivor	duplicate/reconciliation record	input count remains explainable
Unknown reference	key absent from conformed parent	preserve for unknown-key handling or reject per contract	explicit unknown handling	monitored exception if policy requires	no silent row loss
Date boundary	end before start or impossible timestamp	compare parsed dates	corrected only when rule permits	otherwise reject	no coerced nonsense dates

Teaching code section

```
source_df = spark.table(f"{catalog}.bronze.file_shipment_tracking_events")
standardized_df = source_df.select(
    "*",
    F.trim(F.col(source_df.columns[0]).cast("string")).alias("_example_standardized_key")
)
valid_df = standardized_df.filter(F.col("_batch_id") == batch_id)
rejected_df = standardized_df.subtract(valid_df)
(valid_df.write.format("delta").mode("overwrite")
.option("replaceWhere", f"_batch_id = '{batch_id}'")
.saveAsTable(f"{catalog}.silver.shipment_tracking_events"))
```

Common error and recovery

If a cast turns invalid text into null, do not filter nulls without recording them. Add a pre-cast raw column or parse-valid flag, write a rejection reason, reconcile counts, and rerun the batch-scoped partition. If a duplicate rule chooses different survivors across runs, add deterministic tie-break columns and test the ordering.

Interview-ready explanation

"I built `silver.shipment_tracking_events` as a conformed entity with explicit acceptance and rejection rules. I demonstrated dirty input, validated edge cases, and reconciled every input row so cleaning could not silently remove data."

Silver entity 24 — `silver.sales`

Bronze input: `bronze.erp_orders`, `bronze.erp_order_items`.

Silver grain: One accepted, conformed record at the entity grain defined by the source-to-target mapping.

Cleaning responsibility: trim, cast, standardize, deduplicate, validate, and quarantine.

Rejected output: Entity-specific rejection/quarantine rows with `_batch_id`, business key when available, rule ID, reason, offending value, and rejection timestamp.

Business impact: Incorrect cleaning can duplicate revenue, misidentify customers, lose history, overstate inventory, misattribute marketing, or hide late shipments.

Action 10.4.SV24 — Build and test `silver.sales`

Application:

Databricks workspace in a web browser

Window or panel:

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

Starting condition:

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Build and test `silver.sales`. This is one bounded construction or inspection task.

Why this action comes now:

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

Exact physical actions:

1. CLICK: Open the Silver notebook responsible for `sales`.
2. LOOK FOR: Display a dirty Bronze example before writing a cleaning rule.
3. TYPE THIS: Add one explicit rule for the problem, including a rejection reason when the row is not accepted.
4. PRESS: Run the rule against the current batch only.
5. LOOK FOR: Display accepted and rejected examples side by side.
6. PRESS: Count Bronze input, Silver accepted, and rejected rows.
7. LOOK FOR: Require `input = accepted + rejected` unless the contract documents a separate deduplication accounting category.
8. PRESS: Run edge-case tests for null, whitespace, malformed date, duplicate business key, negative amount/quantity, and unknown reference as applicable.
9. DO NOT CONTINUE UNTIL: Counts reconcile and the expected dirty fixture produces the expected outcome.

Command or code:

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

Where to enter it:

Databricks workspace in a web browser. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

What each part means:

1. CLICK: Open the Silver notebook responsible for sales.
2. LOOK FOR: Display a dirty Bronze example before writing a cleaning rule.
3. TYPE THIS: Add one explicit rule for the problem, including a rejection reason when the row is not accepted.
4. PRESS: Run the rule against the current batch only.
5. LOOK FOR: Display accepted and rejected examples side by side.
6. PRESS: Count Bronze input, Silver accepted, and rejected rows.
7. LOOK FOR: Require input = accepted + rejected unless the contract documents a separate deduplication accounting category.
8. PRESS: Run edge-case tests for null, whitespace, malformed date, duplicate business key, negative amount/quantity, and unknown reference as applicable.
9. DO NOT CONTINUE UNTIL: Counts reconcile and the expected dirty fixture produces the expected outcome.

What should happen:

A visible file, folder, branch, connection, table, notebook, task, relationship, measure, visual, or verification result should appear exactly where the action predicts.

literal; the quotation marks preserve spaces or mark text;)) is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation

Edge-case test worksheet

- Actual Bronze rows: [ENTER COUNT]
- Accepted Silver rows: [ENTER COUNT]
- Rejected rows: [ENTER COUNT]
- Deduplicated-but-accounted rows: [ENTER COUNT OR 0]
- Reconciliation equation: [WRITE THE EQUATION AND RESULT]
- Controlled dirty fixture observed: [YES/NO + RULE ID]
- Rerun result for same batch: [ENTER RESULT]

Common error and recovery

If a cast turns invalid text into null, do not filter nulls without recording them. Add a pre-cast raw column or parse-valid flag, write a rejection reason, reconcile counts, and rerun the batch-scoped partition. If a duplicate rule chooses different survivors across runs, add deterministic tie-break columns and test the ordering.

Interview-ready explanation

"I built `silver.sales` as a conformed entity with explicit acceptance and rejection rules. I demonstrated dirty input, validated edge cases, and reconciled every input row so cleaning could not silently remove data."

Silver entity 25 — `silver.promotions`

Bronze input: `bronze.file_promotion_calendar`.

Silver grain: One accepted, conformed record at the entity grain defined by the source-to-target mapping.

Cleaning responsibility: trim, cast, standardize, deduplicate, validate, and quarantine.

Rejected output: Entity-specific rejection/quarantine rows with `_batch_id`, business key when available, rule ID, reason, offending value, and rejection timestamp.

Business impact: Incorrect cleaning can duplicate revenue, misidentify customers, lose history, overstate inventory, misattribute marketing, or hide late shipments.

Action 10.4.SV25 — Build and test `silver.promotions`

Application:

Databricks workspace in a web browser

Window or panel:

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

Starting condition:

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Build and test `silver.promotions`. This is one bounded construction or inspection task.

Why this action comes now:

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

Exact physical actions:

1. CLICK: Open the Silver notebook responsible for promotions.
2. LOOK FOR: Display a dirty Bronze example before writing a cleaning rule.
3. TYPE THIS: Add one explicit rule for the problem, including a rejection reason when the row is not accepted.
4. PRESS: Run the rule against the current batch only.
5. LOOK FOR: Display accepted and rejected examples side by side.
6. PRESS: Count Bronze input, Silver accepted, and rejected rows.
7. LOOK FOR: Require `input = accepted + rejected` unless the contract documents a separate deduplication accounting category.

8. PRESS: Run edge-case tests for null, whitespace, malformed date, duplicate business key, negative amount/quantity, and unknown reference as applicable.
9. DO NOT CONTINUE UNTIL: Counts reconcile and the expected dirty fixture produces the expected outcome.

Command or code:

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

Where to enter it:

Databricks workspace in a web browser. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

What each part means:

1. CLICK: Open the Silver notebook responsible for promotions.
2. LOOK FOR: Display a dirty Bronze example before writing a cleaning rule.
3. TYPE THIS: Add one explicit rule for the problem, including a rejection reason when the row is not accepted.
4. PRESS: Run the rule against the current batch only.
5. LOOK FOR: Display accepted and rejected examples side by side.
6. PRESS: Count Bronze input, Silver accepted, and rejected rows.
7. LOOK FOR: Require input = accepted + rejected unless the contract documents a separate deduplication accounting category.
8. PRESS: Run edge-case tests for null, whitespace, malformed date, duplicate business key, negative amount/quantity, and unknown reference as applicable.
9. DO NOT CONTINUE UNTIL: Counts reconcile and the expected dirty fixture produces the expected outcome.

What should happen:

A visible file, folder, branch, connection, table, notebook, task, relationship, measure, visual, or verification result should appear exactly where the action predicts.

Expected example:

Your exact values may differ. The expected result is the same *type* of object and the same required status, not necessarily the same timestamps, row counts, colors, generated IDs, or screen dimensions.

What may look different:

Menu wording can vary by product release or account tier. Use the official-source register and look for the described object rather than guessing from an old screenshot.

How to verify success:

Reopen or refresh the relevant panel, locate the named object, and inspect the property or output that proves it exists and is in the intended location.

Do not continue unless:

You can point to the visible result and explain what it proves. Mark the action VERIFIED BY USER only after that check.

Common mistake:

Combining several clicks or decisions, choosing a similarly named object, or continuing because no error dialog appeared.

Exact recovery:

Stop at the current screen. Save a screenshot of the error if useful, hide sensitive values, and compare the selected location with the starting condition. Use Back or Cancel rather than Delete or Overwrite. Correct one mismatch and repeat only this action.

What you just accomplished:

You completed one observable piece of the Northstar Retail platform and established a checkpoint that can be audited later.

How this connects to the project:

The resulting object, decision, or evidence becomes an input to the next stage in the source-to-consumption chain.

[Back to the Phase 10 lesson index](#)

Dirty input → rule → expected outputs

Scenario	Dirty input example	Rule	Accepted output	Rejected output	Count expectation
Whitespace/case	padded or mixed-case code	trim and standardize governed code	normalized value	none when otherwise valid	one input becomes one accepted row

Scenario	Dirty input example	Rule	Accepted output	Rejected output	Count expectation
Invalid required value	null, malformed, or impossible value	validate business and type rule	none	original value plus reason	one input becomes one rejected row
Duplicate business key	two candidate rows	deterministic ordering and survivor rule	one survivor	duplicate/reconciliation record	input count remains explainable
Unknown reference	key absent from conformed parent	preserve for unknown-key handling or reject per contract	explicit unknown handling	monitored exception if policy requires	no silent row loss
Date boundary	end before start or impossible timestamp	compare parsed dates	corrected only when rule permits	otherwise reject	no coerced nonsense dates

Teaching code section

```
source_df = spark.table(f"{catalog}.bronze.file_promotion_calendar")
standardized_df = source_df.select(
    "*",
    F.trim(F.col(source_df.columns[0]).cast("string")).alias("_example_standardized_key")
)
valid_df = standardized_df.filter(F.col("_batch_id") == batch_id)
rejected_df = standardized_df.subtract(valid_df)
(valid_df.write.format("delta").mode("overwrite")
.option("replaceWhere", f"_batch_id = '{batch_id}'")
.saveAsTable(f"{catalog}.silver.promotions"))
```

Line-by-line explanation

- Line 1:** `source_df = spark.table(f"{catalog}.bronze.file_promotion_calendar")` — `source_df` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `=` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `spark.table` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `(` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `f` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `"{catalog}.bronze.file_promotion_calendar"` is a quoted literal; the quotation marks preserve spaces or mark text; `)` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation

- **Line 7:** `rejected_df = standardized_df.subtract(valid_df)` — `rejected_df` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `=` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `standardized_df.subtract` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; (is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `valid_df` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation;) is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation
- **Line 8:** `(valid_df.write.format("delta").mode("overwrite"))` — (is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `valid_df.write.format` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; (is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; "delta" is a quoted literal; the quotation marks preserve spaces or mark text;) . is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `mode` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; (is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; "overwrite" is a quoted literal; the quotation marks preserve spaces or mark text;) is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation
- **Line 9:** `.option("replaceWhere", f"_batch_id = '{batch_id}')` — . is a path, relative location, branch-style name, or file argument; verify every character before running it; `option` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; (is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; "replaceWhere" is a quoted literal; the quotation marks preserve spaces or mark text; , is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `f` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; "_batch_id = '{batch_id}'" is a quoted literal; the quotation marks preserve spaces or mark text;) is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation
- **Line 10:** `.saveAsTable(f"{catalog}.silver.promotions"))` — . is a path, relative location, branch-style name, or file argument; verify every character before running it; `saveAsTable` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; (is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `f` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; "{catalog}.silver.promotions" is a quoted literal; the quotation marks preserve spaces or mark text;)) is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation

Edge-case test worksheet

- Actual Bronze rows: [ENTER COUNT]
- Accepted Silver rows: [ENTER COUNT]
- Rejected rows: [ENTER COUNT]
- Deduplicated-but-accounted rows: [ENTER COUNT OR 0]
- Reconciliation equation: [WRITE THE EQUATION AND RESULT]
- Controlled dirty fixture observed: [YES/NO + RULE ID]
- Rerun result for same batch: [ENTER RESULT]

Common error and recovery

If a cast turns invalid text into null, do not filter nulls without recording them. Add a pre-cast raw column or parse-valid flag, write a rejection reason, reconcile counts, and rerun the batch-scoped partition. If a duplicate rule chooses different survivors across runs, add deterministic tie-break columns and test the ordering.

Interview-ready explanation

"I built `silver.promotions` as a conformed entity with explicit acceptance and rejection rules. I demonstrated dirty input, validated edge cases, and reconciled every input row so cleaning could not silently remove data."

What your screen should look like now

- The new Phase 10 objects are visible in their owning application.
- The current branch remains the intended feature branch.
- The current database, catalog, schema, Power BI model, or GitHub run is still identifiable.
- Verification output is visible or recorded; no object is marked complete solely because creation code was displayed.
- Any failed toy demonstration has been repaired or isolated.

Lesson 10.4 completion checklist

☐

Every required object was built separately — [STATUS]

☐

Every object has a declared responsibility/grain — [STATUS]

☐

Inputs and outputs were inspected — [STATUS]

☐

A rerun or alternate-result branch was tested where applicable — [STATUS]

☐

Counts, keys, measures, relationships, or settings were independently validated — [STATUS]

☐

I can explain one failure and its safest recovery — [STATUS]

Safe stopping point

Stop only after the active command, database transaction, Databricks cell/Job, Python process, warehouse load, or Power BI refresh finishes. Save all files and the Power BI project. Record uncommitted Git changes and exact resume action. Resume at [Lesson 10.5](#).

Lesson 10.5 — Verify, troubleshoot, commit, teach back, and stop safely

What your screen should look like before starting

The Phase 10 outputs are visible, all runs are finished, open files are saved, and you can state the active branch and execution context. Any error you encountered has a recorded message and has not been hidden by deleting evidence.

Design decision — Verification before automation

Question:

Should the phase prioritize a visible manual verification or jump directly to automation?

Options considered:

- Manual verification first, then automation.
- Automation without a known-good baseline.
- Manual operation forever.

Beginner path selected:

Establish one verified manual baseline and then automate repeatable checks.

Why this path was selected:

A known-good example makes failures interpretable and prevents automation from hiding a wrong assumption.

Tradeoff:

The first run takes longer.

What a company might do instead:

Teams often pair infrastructure as code and automated tests with controlled bootstrap and acceptance procedures.

How to explain this in an interview:

I established a verified baseline, then encoded the same contract in tests and orchestration so automation preserved meaning rather than just speed.

If you see Result A

Accepted plus rejected plus duplicate outcomes reconcile to Bronze input. Record the exact result, perform the named independent verification, and continue only when the gate is satisfied.

If you see Result B

A cleaning rule silently drops rows, changes grain, or produces an unexplained null/type result. Treat this as information, not permission to delete or overwrite. Follow the branch-specific diagnostic in the current action, preserve evidence, and continue only after the state is understood.

If you see an error

Read the first meaningful error line, redact secrets, and verify the application, path, branch, server/database, catalog/schema, batch ID, parameters, version/tier, and object name. Run the smallest observational check first. Do not reset Git history, drop data, disable a rule, force-push, or replace the target merely to make the error disappear.

Phase-specific verification gate

☐

Required files/objects exist in the exact location.

☐

I personally created or configured them.

☐

I ran the phase commands in the documented context.

☐

I inspected the output rather than relying on a green icon alone.

☐

Counts, keys, relationships, measures, checksums, statuses, or settings meet the declared contract.

☐

Same-batch/rerun behavior is known where applicable.

☐

A controlled failure or realistic alternate-result branch was tested safely where applicable.

☐

No password, token, or secret appears in tracked files, screenshots, notebook output, terminal history pasted into documentation, or staged changes.

☐

Actual verified result: [ENTER VERIFIED RESULT].

Point-of-failure troubleshooting record

Exact or representative error message:

[PASTE THE FIRST MEANINGFUL ERROR, WITH SECRETS REDACTED]

What it means in plain language:

[WRITE YOUR INTERPRETATION]

Most likely cause:

[WRITE ONE TESTABLE HYPOTHESIS]

What not to do:

Do not delete data, drop databases, reset Git history, force-push, disable constraints, edit raw evidence, change a quality threshold, or expose credentials merely to make the symptom disappear.

First diagnostic action:

[ENTER THE SMALLEST OBSERVATIONAL CHECK]

How to read the diagnostic result:

[RESULT A MEANS... / RESULT B MEANS...]

Safest fix:

[ENTER THE NARROW FIX]

Alternative fix when applicable:

[ENTER OR N/A]

How to verify the fix:

[ENTER THE INDEPENDENT RECHECK]

How to return to the main tutorial:

Resume at the exact action number that failed; do not skip its verification gate.

Screenshot checkpoint

Application(s) that should be visible: Databricks notebooks, Catalog Explorer, and SQL/Python cells.

Window/panel: Show dirty input, accepted output, rejected output, and count reconciliation.

Sensitive information to hide: Passwords, tokens, connection strings, email addresses, cloud account IDs, unnecessary Windows profile details, and any secret revealed by an error.

Include: The object name, batch/run ID when relevant, result/status, and enough surrounding UI to prove which application and layer is shown.

Crop out: Unrelated desktop windows, notification previews, bookmarks, chat, and empty background.

Recommended filename: docs/images/phase10_build-the-silver-cleaning-and-conformance-layer_verified.png.

Recommended repository folder: docs/images/.

README placement: The section describing Phase 10's verified result; do not use the image before the result is actually verified.

What it proves: The visible state existed under the shown context. It does not prove hidden rows, other batches, every filter combination, or a later run.

[ADD YOUR VERIFIED SCREENSHOT HERE]

Git checkpoint after the verified Phase 10 changes

Do not use `git add .` until you understand that it stages every matching change under the current directory, including files you did not intend. Prefer targeted staging after inspecting status and diffs.

Save open work

1. PRESS: In VS Code, press Ctrl+K, then S if you use **Save All**, or press Ctrl+S in every modified editor.
2. In Power BI, press Ctrl+S and confirm the local file location.
3. Wait for database, Python, Databricks, and refresh operations to finish; Git does not capture uncommitted database/cloud state.

Action 10.5.G1 — Verify the repository root before Git operations

Application:

Windows PowerShell or the VS Code PowerShell terminal

Window or panel:

VS Code integrated PowerShell terminal

Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

Exact physical actions:

1. CLICK: Bring **Windows PowerShell or the VS Code PowerShell terminal** to the front.
2. LOOK FOR: Confirm the current location matches The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action. or the more specific location stated below.

3. **CLICK:** Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. **TYPE THIS:** Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. **PRESS:** Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. **LOOK FOR:** Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. **DO NOT CONTINUE UNTIL:** Compare the result with the expected shape and complete the verification action.

Command or code (PowerShell):

```
git rev-parse --show-toplevel
```

Where to enter it:

VS Code integrated PowerShell terminal. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

What each part means:

- **Line 1:** `git rev-parse --show-toplevel` — `git` calls the Git version-control program; `rev-parse` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `--show` is a command option or flag; its exact behavior is defined beside the command; `-toplevel` is a command option or flag; its exact behavior is defined beside the command

Does it change anything?

This is intended to inspect or validate state rather than change it.

Is it safe to rerun?

Normally safe to rerun because it is observational, but still confirm the execution location first.

What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

Do not continue unless:

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

Common mistake:

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

Exact recovery:

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

What you just accomplished:

You executed and checked one controlled operation rather than treating a long script as a black box.

How this connects to the project:

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 10 lesson index](#)

Action 10.5.G2 — Verify the active Git branch

Application:

Windows PowerShell or the VS Code PowerShell terminal

Window or panel:

VS Code integrated PowerShell terminal

Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

Exact physical actions:

1. CLICK: Bring **Windows PowerShell or the VS Code PowerShell terminal** to the front.
2. LOOK FOR: Confirm the current location matches The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

Command or code (PowerShell):

```
git branch --show-current
```

Where to enter it:

VS Code integrated PowerShell terminal. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

What each part means:

- **Line 1:** `git branch --show-current` — `git` calls the Git version-control program; `branch` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `--show` is a command option or flag; its exact behavior is defined beside the command; `-current` is a command option or flag; its exact behavior is defined beside the command

Does it change anything?

This is intended to inspect or validate state rather than change it.

Is it safe to rerun?

Normally safe to rerun because it is observational, but still confirm the execution location first.

What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

Do not continue unless:

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

Common mistake:

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

Exact recovery:

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

What you just accomplished:

You executed and checked one controlled operation rather than treating a long script as a black box.

How this connects to the project:

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 10 lesson index](#)

Action 10.5.G3 — Inspect all current Git changes

Application:

Windows PowerShell or the VS Code PowerShell terminal

Window or panel:

VS Code integrated PowerShell terminal

Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

Exact physical actions:

1. CLICK: Bring **Windows PowerShell or the VS Code PowerShell terminal** to the front.
2. LOOK FOR: Confirm the current location matches The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.

5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

Command or code (PowerShell):

```
git status --short
```

Where to enter it:

VS Code integrated PowerShell terminal. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

What each part means:

- **Line 1:** `git status --short` — `git` calls the Git version-control program; `status` shows tracked, staged, modified, and untracked work; `--short` is a command option or flag; its exact behavior is defined beside the command

Does it change anything?

This is intended to inspect or validate state rather than change it.

Is it safe to rerun?

Normally safe to rerun because it is observational, but still confirm the execution location first.

What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

Do not continue unless:

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

Common mistake:

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

Exact recovery:

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

What you just accomplished:

You executed and checked one controlled operation rather than treating a long script as a black box.

How this connects to the project:

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 10 lesson index](#)

Interpret git status --short

- ?? means untracked: Git sees a new path but it is not staged.
- M means modified in the working tree but not staged.
- M means the staged version differs from the last commit.
- MM means a staged version exists and the file has additional unstaged edits.
- A means staged as a new file.
- D means deletion; stop and investigate unless deletion is deliberate.
- R means rename; inspect both old and new paths.
- A blank result means the working tree is clean. It does not prove database, Databricks, or Power BI work occurred.

Action 10.5.G4 — Inspect the unstaged diff for databricks/notebooks/04_silver_customers.py

Application:

Databricks workspace in a web browser

Window or panel:

VS Code integrated PowerShell terminal

Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

Exact physical actions:

1. CLICK: Bring **Databricks workspace in a web browser** to the front.
2. LOOK FOR: Confirm the current location matches The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

Command or code (PowerShell):

```
git diff -- "databricks/notebooks/04_silver_customers.py"
```

Where to enter it:

VS Code integrated PowerShell terminal. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

What each part means:

- **Line 1:** git diff -- "databricks/notebooks/04_silver_customers.py" — git calls the Git version-control program; diff is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; -- is a command option or flag; its exact behavior is defined beside the command; "databricks/notebooks/

04_silver_customers.py" is a path, relative location, branch-style name, or file argument; verify every character before running it

Does it change anything?

This is intended to inspect or validate state rather than change it.

Is it safe to rerun?

Normally safe to rerun because it is observational, but still confirm the execution location first.

What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

[Back to the Phase 10 lesson index](#)

Action 10.5.G5 — Stage only the reviewed file databricks/notebooks/04_silver_customers.py

Application:

Databricks workspace in a web browser

Window or panel:

VS Code integrated PowerShell terminal

Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

Current folder or location:

The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action.

What you are about to do:

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

Exact physical actions:

1. CLICK: Bring **Databricks workspace in a web browser** to the front.
2. LOOK FOR: Confirm the current location matches The selected Databricks workspace, catalog, schema, volume, notebook, or Job named in the action. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

Command or code (PowerShell):

```
git add -- "databricks/notebooks/04_silver_customers.py"
```

Where to enter it:

VS Code integrated PowerShell terminal. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

What each part means:

- **Line 1:** `git add -- "databricks/notebooks/04_silver_customers.py"` — `git` calls the Git version-control program; `add` moves selected changes into the staging area; `--` is a command option or flag; its exact behavior is defined beside the command; `"databricks/notebooks/04_silver_customers.py"` is a path, relative location, branch-style name, or file argument; verify every character before running it

Does it change anything?

This can change files, Git state, packages, database objects, or data.

Is it safe to rerun?

Safe to rerun only after reading the idempotency note and confirming that the same batch, file, or object will not be duplicated.

What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

How to verify success:

Run or perform the smallest independent check named in the lesson.
