- **Line 7:** `.coverage` — `.` is a path, relative location, branch-style name, or file argument; verify every character before running it; `coverage` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation
- **Line 8:** `htmlcov/` — `htmlcov` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `/` is a path, relative location, branch-style name, or file argument; verify every character before running it
- **Line 9:** blank line used only to separate logical sections for readability.
- **Line 10:** `# Secrets and local configuration` is a comment for a human reader; it normally does not change data or execute business logic.
- **Line 11:** `.env` — `.` is a path, relative location, branch-style name, or file argument; verify every character before running it; `env` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation
- **Line 12:** `.env.*` — `.` is a path, relative location, branch-style name, or file argument; verify every character before running it; `env` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `.*` is a path, relative location, branch-style name, or file argument; verify every character before running it
- **Line 13:** `!.env.example` — `.` is a path, relative location, branch-style name, or file argument; verify every character before running it; `env.example` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation
- **Line 14:** `config/dev.yml` — `config` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `/` is a path, relative location, branch-style name, or file argument; verify every character before running it; `dev.yml` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation
- **Line 15:** `*.pem` — `*` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `pem` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation
- **Line 16:** `*.key` — `*` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `key` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation
- **Line 17:** `*.pfx` — `*` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `pfx` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation
- **Line 18:** `*.p12` — `*` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `p12` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation
- **Line 19:** blank line used only to separate logical sections for readability.
- **Line 20:** `# Generated data: keep only the intentionally small sample folder` is a comment for a human reader; it normally does not change data or execute business logic.
- **Line 21:** `/datasets/raw/**` — `/` is a path, relative location, branch-style name, or file argument; verify every character before running it; `datasets` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `/` is a path, relative location, branch-style name, or file argument; verify every character before running it; `raw` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `/**` is a path, relative location, branch-style name, or file argument; verify every character before running it
- **Line 22:** `!/datasets/raw/**/.gitkeep` — `/` is a path, relative location, branch-style name, or file argument; verify every character before running it; `datasets` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `/` is a path, relative location, branch-style name, or file argument; verify every character before running it; `raw` is a name, keyword, argument, identifier, or literal whose project-specific role is

described in the surrounding explanation; `/**/` is a path, relative location, branch-style name, or file argument; verify every character before running it; `gitkeep` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation

- **Line 23:** `/datasets/generated/**` — `/` is a path, relative location, branch-style name, or file argument; verify every character before running it; `datasets` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `/` is a path, relative location, branch-style name, or file argument; verify every character before running it; `generated` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `/**` is a path, relative location, branch-style name, or file argument; verify every character before running it
- **Line 24:** `/datasets/tmp/**` — `/` is a path, relative location, branch-style name, or file argument; verify every character before running it; `datasets` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `/` is a path, relative location, branch-style name, or file argument; verify every character before running it; `tmp` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `/**` is a path, relative location, branch-style name, or file argument; verify every character before running it
- **Line 25:** blank line used only to separate logical sections for readability.
- **Line 26:** `# Logs and manifests created during local runs` is a comment for a human reader; it normally does not change data or execute business logic.
- **Line 27:** `/logs/**` — `/` is a path, relative location, branch-style name, or file argument; verify every character before running it; `logs` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `/**` is a path, relative location, branch-style name, or file argument; verify every character before running it
- **Line 28:** `!/logs/.gitkeep` — `/` is a path, relative location, branch-style name, or file argument; verify every character before running it; `logs` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `/` is a path, relative location, branch-style name, or file argument; verify every character before running it; `gitkeep` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation
- **Line 29:** `/run_artifacts/**` — `/` is a path, relative location, branch-style name, or file argument; verify every character before running it; `run_artifacts` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `/**` is a path, relative location, branch-style name, or file argument; verify every character before running it
- **Line 30:** blank line used only to separate logical sections for readability.
- **Line 31:** `# Power BI and database artifacts` is a comment for a human reader; it normally does not change data or execute business logic.
- **Line 32:** `*.pbix` — `*` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `pbix` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation
- **Line 33:** `*.pbit` — `*` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `pbit` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation
- **Line 34:** `*.bak` — `*` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `bak` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation
- **Line 35:** `*.bacpac` — `*` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `bacpac` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation
- **Line 36:** `*.mdf` — `*` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `mdf` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation
- **Line 37:** `*.ldf` — `*` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `ldf` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation
- **Line 38:** blank line used only to separate logical sections for readability.
- **Line 39:** `# Databricks and local tooling` is a comment for a human reader; it normally does not change data or execute business logic.
- **Line 40:** `.databricks/` — `.` is a path, relative location, branch-style name, or file argument; verify every character before running it; `databricks` is a name, keyword, argument, identifier, or literal whose project-specific role is

described in the surrounding explanation; / is a path, relative location, branch-style name, or file argument; verify every character before running it

- **Line 41:** `.vscode/settings.json` — `.` is a path, relative location, branch-style name, or file argument; verify every character before running it; `vscode` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; / is a path, relative location, branch-style name, or file argument; verify every character before running it; `settings.json` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation
- **Line 42:** `.idea/` — `.` is a path, relative location, branch-style name, or file argument; verify every character before running it; `idea` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; / is a path, relative location, branch-style name, or file argument; verify every character before running it
- **Line 43:** blank line used only to separate logical sections for readability.
- **Line 44:** `# OS` is a comment for a human reader; it normally does not change data or execute business logic.
- **Line 45:** `Thumbs.db` — `Thumbs.db` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation
- **Line 46:** `.DS_Store` — `.` is a path, relative location, branch-style name, or file argument; verify every character before running it; `DS_Store` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation

[Back to the Phase 18 lesson index](#)

## What your screen should look like now

---

- Every Phase 18 file you actually created appears under the correct parent folder.
- Your open editor tab matches the file you are validating.
- The Git branch has not changed unexpectedly.
- `git status --short` lists only expected work.
- Reference answers remain reference material; your status fields are not automatically completed.

## Lesson 18.3 completion checklist

---

☐

`docs/security_and_cost.md` was created by me, saved, located correctly, and inspected — [STATUS]

☐

`scripts/validation/scan_secrets.py` was created by me, saved, located correctly, and inspected — [STATUS]

☐

`.env.example` was created by me, saved, located correctly, and inspected — [STATUS]

☐

`.gitignore` was created by me, saved, located correctly, and inspected — [STATUS]

## Safe stopping point

---

Save every open file with `Ctrl+S`. You may close VS Code only after `git status --short` is recorded in your journal. The terminal may be closed when no installer, transaction, Python process, Databricks run, warehouse load, or Power BI refresh is active. Resume at [Lesson 18.4](#) and recheck the root and branch.

## Lesson 18.4 — Build and validate required objects

---

### What your screen should look like before starting

---

The phase files are saved, the correct application and connection are visible, and the upstream input has passed its verification gate. Build one object at a time; do not create many objects and inspect them only at the end.

## Action 18.4.G1 — Inspect the current state without changing it

---

**Application:**

VS Code

**Window or panel:**

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

**Starting condition:**

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

**Current folder or location:**

The repository root C:\Users\User\Desktop\Northstar\_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username.

**What you are about to do:**

Inspect the current state without changing it. This is one bounded construction or inspection task.

**Why this action comes now:**

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

**Exact physical actions:**

1. Record the exact starting folders, branch, versions, connections, settings, counts, or evidence.
2. Inspect the result.
3. Record the actual value.
4. Continue only after verification.

**Command or code:**

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

**Where to enter it:**

VS Code. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

**What each part means:**

1. Record the exact starting folders, branch, versions, connections, settings, counts, or evidence.
2. Inspect the result.
3. Record the actual value.
4. Continue only after verification.

**What should happen:**

A visible file, folder, branch, connection, table, notebook, task, relationship, measure, visual, or verification result should appear exactly where the action predicts.

**Expected example:**

Your exact values may differ. The expected result is the same *type* of object and the same required status, not necessarily the same timestamps, row counts, colors, generated IDs, or screen dimensions.

**What may look different:**

Menu wording can vary by product release or account tier. Use the official-source register and look for the described object rather than guessing from an old screenshot.

**How to verify success:**

Reopen or refresh the relevant panel, locate the named object, and inspect the property or output that proves it exists and is in the intended location.

**Do not continue unless:**

You can point to the visible result and explain what it proves. Mark the action VERIFIED BY USER only after that check.

**Common mistake:**

Combining several clicks or decisions, choosing a similarly named object, or continuing because no error dialog appeared.

**Exact recovery:**

Stop at the current screen. Save a screenshot of the error if useful, hide sensitive values, and compare the selected location with the starting condition. Use Back or Cancel rather than Delete or Overwrite. Correct one mismatch and repeat only this action.

**What you just accomplished:**

You completed one observable piece of the Northstar Retail platform and established a checkpoint that can be audited later.

**How this connects to the project:**

The resulting object, decision, or evidence becomes an input to the next stage in the source-to-consumption chain.

[Back to the Phase 18 lesson index](#)

## Action 18.4.G2 — Create the smallest required object or decision

---

**Application:**

Visual Studio Code

**Window or panel:**

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

**Starting condition:**

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

**Current folder or location:**

The repository root C:\Users\User\Desktop\Northstar\_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username.

**What you are about to do:**

Create the smallest required object or decision. This is one bounded construction or inspection task.

**Why this action comes now:**

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

**Exact physical actions:**

1. Use the phase file tutorial and one bounded action card.
2. Inspect the result.
3. Record the actual value.
4. Continue only after verification.

**Command or code:**

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

**Where to enter it:**

Visual Studio Code. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

**What each part means:**

1. Use the phase file tutorial and one bounded action card.
2. Inspect the result.
3. Record the actual value.
4. Continue only after verification.

**What should happen:**

A visible file, folder, branch, connection, table, notebook, task, relationship, measure, visual, or verification result should appear exactly where the action predicts.

**Expected example:**

Your exact values may differ. The expected result is the same *type* of object and the same required status, not necessarily the same timestamps, row counts, colors, generated IDs, or screen dimensions.

**What may look different:**

Menu wording can vary by product release or account tier. Use the official-source register and look for the described object rather than guessing from an old screenshot.

**How to verify success:**

Reopen or refresh the relevant panel, locate the named object, and inspect the property or output that proves it exists and is in the intended location.

**Do not continue unless:**

You can point to the visible result and explain what it proves. Mark the action VERIFIED BY USER only after that check.

**Common mistake:**

Combining several clicks or decisions, choosing a similarly named object, or continuing because no error dialog appeared.

**Exact recovery:**

Stop at the current screen. Save a screenshot of the error if useful, hide sensitive values, and compare the selected location with the starting condition. Use Back or Cancel rather than Delete or Overwrite. Correct one mismatch and repeat only this action.

**What you just accomplished:**

You completed one observable piece of the Northstar Retail platform and established a checkpoint that can be audited later.

**How this connects to the project:**

The resulting object, decision, or evidence becomes an input to the next stage in the source-to-consumption chain.

[Back to the Phase 18 lesson index](#)

## Action 18.4.G3 — Run the phase-specific verification

---

**Application:**

VS Code

**Window or panel:**

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

**Starting condition:**

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

**Current folder or location:**

The repository root C:\Users\User\Desktop\Northstar\_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username.

**What you are about to do:**

Run the phase-specific verification. This is one bounded construction or inspection task.

**Why this action comes now:**

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

**Exact physical actions:**

1. Compare actual output with the required condition and record differences.
2. Inspect the result.
3. Record the actual value.
4. Continue only after verification.

**Command or code:**

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

**Where to enter it:**

VS Code. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

**What each part means:**

1. Compare actual output with the required condition and record differences.
2. Inspect the result.
3. Record the actual value.
4. Continue only after verification.

**What should happen:**

A visible file, folder, branch, connection, table, notebook, task, relationship, measure, visual, or verification result should appear exactly where the action predicts.

**Expected example:**

Your exact values may differ. The expected result is the same *type* of object and the same required status, not necessarily the same timestamps, row counts, colors, generated IDs, or screen dimensions.

**What may look different:**

Menu wording can vary by product release or account tier. Use the official-source register and look for the described object rather than guessing from an old screenshot.

**How to verify success:**

Reopen or refresh the relevant panel, locate the named object, and inspect the property or output that proves it exists and is in the intended location.

**Do not continue unless:**

You can point to the visible result and explain what it proves. Mark the action VERIFIED BY USER only after that check.

**Common mistake:**

Combining several clicks or decisions, choosing a similarly named object, or continuing because no error dialog appeared.

**Exact recovery:**

Stop at the current screen. Save a screenshot of the error if useful, hide sensitive values, and compare the selected location with the starting condition. Use Back or Cancel rather than Delete or Overwrite. Correct one mismatch and repeat only this action.

**What you just accomplished:**

You completed one observable piece of the Northstar Retail platform and established a checkpoint that can be audited later.

**How this connects to the project:**

The resulting object, decision, or evidence becomes an input to the next stage in the source-to-consumption chain.

[Back to the Phase 18 lesson index](#)

## Action 18.4.G4 — Demonstrate one safe failure or alternate-result branch

---

**Application:**

VS Code

**Window or panel:**

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

**Starting condition:**

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

**Current folder or location:**

The repository root C:\Users\User\Desktop\Northstar\_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username.

**What you are about to do:**

Demonstrate one safe failure or alternate-result branch. This is one bounded construction or inspection task.

**Why this action comes now:**

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

**Exact physical actions:**

1. Use a toy/disposable case and prove recovery without damaging verified work.
2. Inspect the result.
3. Record the actual value.
4. Continue only after verification.

**Command or code:**

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

**Where to enter it:**

VS Code. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

**What each part means:**

1. Use a toy/disposable case and prove recovery without damaging verified work.
2. Inspect the result.
3. Record the actual value.

4. Continue only after verification.

**What should happen:**

A visible file, folder, branch, connection, table, notebook, task, relationship, measure, visual, or verification result should appear exactly where the action predicts.

**Expected example:**

Your exact values may differ. The expected result is the same *type* of object and the same required status, not necessarily the same timestamps, row counts, colors, generated IDs, or screen dimensions.

**What may look different:**

Menu wording can vary by product release or account tier. Use the official-source register and look for the described object rather than guessing from an old screenshot.

**How to verify success:**

Reopen or refresh the relevant panel, locate the named object, and inspect the property or output that proves it exists and is in the intended location.

**Do not continue unless:**

You can point to the visible result and explain what it proves. Mark the action VERIFIED BY USER only after that check.

**Common mistake:**

Combining several clicks or decisions, choosing a similarly named object, or continuing because no error dialog appeared.

**Exact recovery:**

Stop at the current screen. Save a screenshot of the error if useful, hide sensitive values, and compare the selected location with the starting condition. Use Back or Cancel rather than Delete or Overwrite. Correct one mismatch and repeat only this action.

**What you just accomplished:**

You completed one observable piece of the Northstar Retail platform and established a checkpoint that can be audited later.

**How this connects to the project:**

The resulting object, decision, or evidence becomes an input to the next stage in the source-to-consumption chain.

[Back to the Phase 18 lesson index](#)

## Action 18.4.G5 — Record evidence and prepare the downstream handoff

**Application:**

VS Code

**Window or panel:**

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

**Starting condition:**

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

**Current folder or location:**

The repository root C:\Users\User\Desktop\Northstar\_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username.

**What you are about to do:**

Record evidence and prepare the downstream handoff. This is one bounded construction or inspection task.

**Why this action comes now:**

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

**Exact physical actions:**

1. Save the verified input that the next phase consumes.
2. Inspect the result.
3. Record the actual value.
4. Continue only after verification.

**Command or code:**

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

**Where to enter it:**

VS Code. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

**What each part means:**

1. Save the verified input that the next phase consumes.
2. Inspect the result.
3. Record the actual value.
4. Continue only after verification.

**What should happen:**

A visible file, folder, branch, connection, table, notebook, task, relationship, measure, visual, or verification result should appear exactly where the action predicts.

**Expected example:**

Your exact values may differ. The expected result is the same *type* of object and the same required status, not necessarily the same timestamps, row counts, colors, generated IDs, or screen dimensions.

**What may look different:**

Menu wording can vary by product release or account tier. Use the official-source register and look for the described object rather than guessing from an old screenshot.

**How to verify success:**

Reopen or refresh the relevant panel, locate the named object, and inspect the property or output that proves it exists and is in the intended location.

**Do not continue unless:**

You can point to the visible result and explain what it proves. Mark the action VERIFIED BY USER only after that check.

**Common mistake:**

Combining several clicks or decisions, choosing a similarly named object, or continuing because no error dialog appeared.

**Exact recovery:**

Stop at the current screen. Save a screenshot of the error if useful, hide sensitive values, and compare the selected location with the starting condition. Use Back or Cancel rather than Delete or Overwrite. Correct one mismatch and repeat only this action.

**What you just accomplished:**

You completed one observable piece of the Northstar Retail platform and established a checkpoint that can be audited later.

**How this connects to the project:**

The resulting object, decision, or evidence becomes an input to the next stage in the source-to-consumption chain.

[Back to the Phase 18 lesson index](#)

## What your screen should look like now

- The new Phase 18 objects are visible in their owning application.
- The current branch remains the intended feature branch.
- The current database, catalog, schema, Power BI model, or GitHub run is still identifiable.
- Verification output is visible or recorded; no object is marked complete solely because creation code was displayed.
- Any failed toy demonstration has been repaired or isolated.

## Lesson 18.4 completion checklist

☐

Every required object was built separately — [STATUS]

☐

Every object has a declared responsibility/grain — [STATUS]

☐

Inputs and outputs were inspected — [STATUS]

A rerun or alternate-result branch was tested where applicable — [STATUS]

Counts, keys, measures, relationships, or settings were independently validated — [STATUS]

I can explain one failure and its safest recovery — [STATUS]

## Safe stopping point

---

Stop only after the active command, database transaction, Databricks cell/Job, Python process, warehouse load, or Power BI refresh finishes. Save all files and the Power BI project. Record uncommitted Git changes and exact resume action. Resume at [Lesson 18.5](#).

## Lesson 18.5 — Verify, troubleshoot, commit, teach back, and stop safely

---

### What your screen should look like before starting

---

The Phase 18 outputs are visible, all runs are finished, open files are saved, and you can state the active branch and execution context. Any error you encountered has a recorded message and has not been hidden by deleting evidence.

### Design decision — Verification before automation

---

#### Question:

Should the phase prioritize a visible manual verification or jump directly to automation?

#### Options considered:

- Manual verification first, then automation.
- Automation without a known-good baseline.
- Manual operation forever.

#### Beginner path selected:

Establish one verified manual baseline and then automate repeatable checks.

#### Why this path was selected:

A known-good example makes failures interpretable and prevents automation from hiding a wrong assumption.

#### Tradeoff:

The first run takes longer.

#### What a company might do instead:

Teams often pair infrastructure as code and automated tests with controlled bootstrap and acceptance procedures.

#### How to explain this in an interview:

I established a verified baseline, then encoded the same contract in tests and orchestration so automation preserved meaning rather than just speed.

### If you see Result A

---

.env stays ignored, the secret scan is clean, and idle compute is stopped. Record the exact result, perform the named independent verification, and continue only when the gate is satisfied.

### If you see Result B

---

A credential-like value is staged, printed, or stored in an unsafe location, or compute remains active. Treat this as information, not permission to delete or overwrite. Follow the branch-specific diagnostic in the current action, preserve evidence, and continue only after the state is understood.

### If you see an error

---

Read the first meaningful error line, redact secrets, and verify the application, path, branch, server/database, catalog/schema, batch ID, parameters, version/tier, and object name. Run the smallest observational check first. Do not reset Git history, drop data, disable a rule, force-push, or replace the target merely to make the error disappear.

## Phase-specific verification gate

---

☐

Required files/objects exist in the exact location.

☐

I personally created or configured them.

☐

I ran the phase commands in the documented context.

☐

I inspected the output rather than relying on a green icon alone.

☐

Counts, keys, relationships, measures, checksums, statuses, or settings meet the declared contract.

☐

Same-batch/rerun behavior is known where applicable.

☐

A controlled failure or realistic alternate-result branch was tested safely where applicable.

☐

No password, token, or secret appears in tracked files, screenshots, notebook output, terminal history pasted into documentation, or staged changes.

☐

Actual verified result: [ENTER VERIFIED RESULT].

## Point-of-failure troubleshooting record

---

### Exact or representative error message:

[PASTE THE FIRST MEANINGFUL ERROR, WITH SECRETS REDACTED]

### What it means in plain language:

[WRITE YOUR INTERPRETATION]

### Most likely cause:

[WRITE ONE TESTABLE HYPOTHESIS]

### What not to do:

Do not delete data, drop databases, reset Git history, force-push, disable constraints, edit raw evidence, change a quality threshold, or expose credentials merely to make the symptom disappear.

### First diagnostic action:

[ENTER THE SMALLEST OBSERVATIONAL CHECK]

### How to read the diagnostic result:

[RESULT A MEANS... / RESULT B MEANS...]

### Safest fix:

[ENTER THE NARROW FIX]

### Alternative fix when applicable:

[ENTER OR N/A]

### How to verify the fix:

[ENTER THE INDEPENDENT RECHECK]

### How to return to the main tutorial:

Resume at the exact action number that failed; do not skip its verification gate.

## Screenshot checkpoint

---

**Application(s) that should be visible:** VS Code, PowerShell, Git, GitHub, Databricks settings, and Power BI options.

**Window/panel:** Show ignored .env, secret-scan output, Databricks compute state, and cost checklist.

**Sensitive information to hide:** Passwords, tokens, connection strings, email addresses, cloud account IDs, unnecessary Windows profile details, and any secret revealed by an error.

**Include:** The object name, batch/run ID when relevant, result/status, and enough surrounding UI to prove which application and layer is shown.

**Crop out:** Unrelated desktop windows, notification previews, bookmarks, chat, and empty background.

**Recommended filename:** docs/images/phase18\_secure-secrets-control-cost-and-review-operational-sett\_verified.png.

**Recommended repository folder:** docs/images/.

**README placement:** The section describing Phase 18's verified result; do not use the image before the result is actually verified.

**What it proves:** The visible state existed under the shown context. It does not prove hidden rows, other batches, every filter combination, or a later run.

[ADD YOUR VERIFIED SCREENSHOT HERE]

## Git checkpoint after the verified Phase 18 changes

---

Do not use `git add .` until you understand that it stages every matching change under the current directory, including files you did not intend. Prefer targeted staging after inspecting status and diffs.

### Save open work

1. PRESS: In VS Code, press Ctrl+K, then S if you use **Save All**, or press Ctrl+S in every modified editor.
2. In Power BI, press Ctrl+S and confirm the local file location.
3. Wait for database, Python, Databricks, and refresh operations to finish; Git does not capture uncommitted database/cloud state.

## Action 18.5.G1 — Verify the repository root before Git operations

---

### Application:

Windows PowerShell or the VS Code PowerShell terminal

### Window or panel:

VS Code integrated PowerShell terminal

### Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

### Current folder or location:

The repository root C:\Users\User\Desktop\Northstar\_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username.

### What you are about to do:

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

### Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

### Exact physical actions:

1. CLICK: Bring **Windows PowerShell or the VS Code PowerShell terminal** to the front.
2. LOOK FOR: Confirm the current location matches The repository root C:\Users\User\Desktop\Northstar\_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

### Command or code (PowerShell):

```
git rev-parse --show-toplevel
```

**Where to enter it:**

VS Code integrated PowerShell terminal. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

**Plain-English translation:**

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

**What each part means:**

- **Line 1:** `git rev-parse --show-toplevel` — `git` calls the Git version-control program; `rev-parse` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `--show` is a command option or flag; its exact behavior is defined beside the command; `-toplevel` is a command option or flag; its exact behavior is defined beside the command

**Does it change anything?**

This is intended to inspect or validate state rather than change it.

**Is it safe to rerun?**

Normally safe to rerun because it is observational, but still confirm the execution location first.

**What should happen:**

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

**Expected example:**

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

**What may look different:**

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

**How to verify success:**

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

**Do not continue unless:**

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

**Common mistake:**

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

**Exact recovery:**

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

**What you just accomplished:**

You executed and checked one controlled operation rather than treating a long script as a black box.

**How this connects to the project:**

This verified state becomes a dependable input to the next Northstar Retail construction action.

## Action 18.5.G2 — Verify the active Git branch

**Application:**

Windows PowerShell or the VS Code PowerShell terminal

**Window or panel:**

VS Code integrated PowerShell terminal

**Starting condition:**

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

**Current folder or location:**

The repository root C:\Users\User\Desktop\Northstar\_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username.

**What you are about to do:**

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

**Why this action comes now:**

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

**Exact physical actions:**

1. CLICK: Bring **Windows PowerShell or the VS Code PowerShell terminal** to the front.
2. LOOK FOR: Confirm the current location matches The repository root C:\Users\User\Desktop\Northstar\_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

**Command or code (PowerShell):**

```
git branch --show-current
```

**Where to enter it:**

VS Code integrated PowerShell terminal. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

**Plain-English translation:**

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

**What each part means:**

- **Line 1:** `git branch --show-current` — `git` calls the Git version-control program; `branch` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `--show` is a command option or flag; its exact behavior is defined beside the command; `-current` is a command option or flag; its exact behavior is defined beside the command

**Does it change anything?**

This is intended to inspect or validate state rather than change it.

**Is it safe to rerun?**

Normally safe to rerun because it is observational, but still confirm the execution location first.

**What should happen:**

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

**Expected example:**

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

**What may look different:**

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

**How to verify success:**

Run or perform the smallest independent check named in the lesson. For a path, use Get-Location or Test-Path; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

**Do not continue unless:**

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

**Common mistake:**

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

**Exact recovery:**

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

**What you just accomplished:**

You executed and checked one controlled operation rather than treating a long script as a black box.

**How this connects to the project:**

This verified state becomes a dependable input to the next Northstar Retail construction action.

## Action 18.5.G3 — Inspect all current Git changes

---

**Application:**

Windows PowerShell or the VS Code PowerShell terminal

**Window or panel:**

VS Code integrated PowerShell terminal

**Starting condition:**

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

**Current folder or location:**

The repository root `C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project`. The User segment is an example; verify your real Windows username.

**What you are about to do:**

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

**Why this action comes now:**

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

**Exact physical actions:**

1. CLICK: Bring **Windows PowerShell or the VS Code PowerShell terminal** to the front.
2. LOOK FOR: Confirm the current location matches The repository root `C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project`. The User segment is an example; verify your real Windows username. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

**Command or code (PowerShell):**

```
git status --short
```

**Where to enter it:**

VS Code integrated PowerShell terminal. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

**Plain-English translation:**

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

**What each part means:**

- **Line 1:** `git status --short` — `git` calls the Git version-control program; `status` shows tracked, staged, modified, and untracked work; `--short` is a command option or flag; its exact behavior is defined beside the command

**Does it change anything?**

This is intended to inspect or validate state rather than change it.

**Is it safe to rerun?**

Normally safe to rerun because it is observational, but still confirm the execution location first.

**What should happen:**

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

**Expected example:**

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

**What may look different:**

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

**How to verify success:**

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

**Do not continue unless:**

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

**Common mistake:**

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

**Exact recovery:**

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

**What you just accomplished:**

You executed and checked one controlled operation rather than treating a long script as a black box.

**How this connects to the project:**

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 18 lesson index](#)

**Interpret `git status --short`**

- `??` means untracked: Git sees a new path but it is not staged.
- `M` means modified in the working tree but not staged.
- `M` means the staged version differs from the last commit.
- `MM` means a staged version exists and the file has additional unstaged edits.
- `A` means staged as a new file.
- `D` means deletion; stop and investigate unless deletion is deliberate.
- `R` means rename; inspect both old and new paths.

- A blank result means the working tree is clean. It does not prove database, Databricks, or Power BI work occurred.

## Action 18.5.G4 — Inspect the unstaged diff for docs/security\_and\_cost.md

---

### Application:

Windows PowerShell or the VS Code PowerShell terminal

### Window or panel:

VS Code integrated PowerShell terminal

### Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

**What you just accomplished:**

You executed and checked one controlled operation rather than treating a long script as a black box.

**How this connects to the project:**

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 18 lesson index](#)

## Action 18.5.G5 — Stage only the reviewed file docs/security\_and\_cost.md

**Application:**

Windows PowerShell or the VS Code PowerShell terminal

**Window or panel:**

VS Code integrated PowerShell terminal

**Starting condition:**

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

**Current folder or location:**

The repository root `C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project`. The User segment is an example; verify your real Windows username.

**What you are about to do:**

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

**Why this action comes now:**

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

**Exact physical actions:**

1. CLICK: Bring **Windows PowerShell or the VS Code PowerShell terminal** to the front.
2. LOOK FOR: Confirm the current location matches The repository root `C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project`. The User segment is an example; verify your real Windows username. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.

4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

#### Command or code (PowerShell):

```
git add -- "docs/security_and_cost.md"
```

#### Where to enter it:

VS Code integrated PowerShell terminal. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

#### Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

#### What each part means:

- **Line 1:** `git add -- "docs/security_and_cost.md"` — `git` calls the Git version-control program; `add` moves selected changes into the staging area; `--` is a command option or flag; its exact behavior is defined beside the command; `"docs/security_and_cost.md"` is a path, relative location, branch-style name, or file argument; verify every character before running it

#### Does it change anything?

This can change files, Git state, packages, database objects, or data.

#### Is it safe to rerun?

Safe to rerun only after reading the idempotency note and confirming that the same batch, file, or object will not be duplicated.

#### What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

#### Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

#### What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

#### How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

#### Do not continue unless:

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

#### Common mistake:

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

#### Exact recovery:

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

#### What you just accomplished:

You executed and checked one controlled operation rather than treating a long script as a black box.

**How this connects to the project:**

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 18 lesson index](#)

For every additional intended path, run a separate targeted `git add -- "path"` after its diff is reviewed. Never stage `.env`, generated raw batches, credentials, tokens, local database files, or an unverified Power BI artifact.

## Action 18.5.G6 — Inspect the staged diff

---

**Application:**

Windows PowerShell or the VS Code PowerShell terminal

**Window or panel:**

VS Code integrated PowerShell terminal

**Starting condition:**

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

**Current folder or location:**

The repository root `C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project`. The User segment is an example; verify your real Windows username.

**What you are about to do:**

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

**Why this action comes now:**

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

**Exact physical actions:**

1. CLICK: Bring **Windows PowerShell or the VS Code PowerShell terminal** to the front.
2. LOOK FOR: Confirm the current location matches The repository root `C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project`. The User segment is an example; verify your real Windows username. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

**Command or code (PowerShell):**

```
git diff --cached
```

**Where to enter it:**

VS Code integrated PowerShell terminal. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

**Plain-English translation:**

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

**What each part means:**

- **Line 1:** `git diff --cached` — `git` calls the Git version-control program; `diff` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `--cached` is a command option or flag; its exact behavior is defined beside the command

**Does it change anything?**

This is intended to inspect or validate state rather than change it.

**Is it safe to rerun?**

Normally safe to rerun because it is observational, but still confirm the execution location first.

**What should happen:**

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

**Expected example:**

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

**What may look different:**

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

**How to verify success:**

Run or perform the smallest independent check named in the lesson. For a path, use Get-Location or Test-Path; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

**Do not continue unless:**

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

**Exact recovery:**

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

**What you just accomplished:**

You executed and checked one controlled operation rather than treating a long script as a black box.

**How this connects to the project:**

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 18 lesson index](#)

## Action 18.5.G7 — Create the Phase 18 commit

**Application:**

Windows PowerShell or the VS Code PowerShell terminal

**Window or panel:**

VS Code integrated PowerShell terminal

**Starting condition:**

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

**Current folder or location:**

The repository root `C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project`. The User segment is an example; verify your real Windows username.

**What you are about to do:**

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

**Why this action comes now:**

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

**Exact physical actions:**

1. CLICK: Bring **Windows PowerShell or the VS Code PowerShell terminal** to the front.

2. LOOK FOR: Confirm the current location matches The repository root C:\Users\User\Desktop\Northstar\_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

#### Command or code (PowerShell):

```
git commit -m "security: protect secrets and document cost controls"
```

#### Where to enter it:

VS Code integrated PowerShell terminal. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

#### Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

#### What each part means:

- **Line 1:** `git commit -m "security: protect secrets and document cost controls"` — `git` calls the Git version-control program; `commit` records the staged snapshot; `-m` asks Python to run an installed module; `"security: protect secrets and document cost controls"` is a quoted literal; the quotation marks preserve spaces or mark text

#### Does it change anything?

This can change files, Git state, packages, database objects, or data.

#### Is it safe to rerun?

Safe to rerun only after reading the idempotency note and confirming that the same batch, file, or object will not be duplicated.

#### What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

#### Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

#### What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

#### How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

#### Do not continue unless:

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

#### Common mistake:

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

#### Exact recovery:

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

**What you just accomplished:**

You executed and checked one controlled operation rather than treating a long script as a black box.

**How this connects to the project:**

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 18 lesson index](#)

## Action 18.5.G8 — Verify the new commit

---

**Application:**

Windows PowerShell or the VS Code PowerShell terminal

**Window or panel:**

VS Code integrated PowerShell terminal

**Starting condition:**

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

**Current folder or location:**

The repository root C:\Users\User\Desktop\Northstar\_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username.

**What you are about to do:**

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

**Why this action comes now:**

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

**Exact physical actions:**

1. CLICK: Bring **Windows PowerShell or the VS Code PowerShell terminal** to the front.
2. LOOK FOR: Confirm the current location matches The repository root C:\Users\User\Desktop\Northstar\_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

**Command or code (PowerShell):**

```
git log -1 --oneline --decorate
```

**Where to enter it:**

VS Code integrated PowerShell terminal. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

**Plain-English translation:**

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

**What each part means:**

- **Line 1:** `git log -1 --oneline --decorate` — `git` calls the Git version-control program; `log` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `-1` is a command option or flag; its exact behavior is defined beside the command; `--oneline` is a command option or flag; its exact behavior is defined beside the command; `--decorate` is a command option or flag; its exact behavior is defined beside the command

**Does it change anything?**

This is intended to inspect or validate state rather than change it.

**Is it safe to rerun?**

Normally safe to rerun because it is observational, but still confirm the execution location first.

**What should happen:**

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

**Expected example:**

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

**What may look different:**

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

**How to verify success:**

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

**Do not continue unless:**

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

**Common mistake:**

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

**Exact recovery:**

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

**What you just accomplished:**

You executed and checked one controlled operation rather than treating a long script as a black box.

**How this connects to the project:**

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 18 lesson index](#)

## Action 18.5.G9 — Push the feature branch and set upstream

**Application:**

Windows PowerShell or the VS Code PowerShell terminal

**Window or panel:**

VS Code integrated PowerShell terminal

**Starting condition:**

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

**Current folder or location:**

The repository root `C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project`. The User segment is an example; verify your real Windows username.

**What you are about to do:**

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

**Why this action comes now:**

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

**Exact physical actions:**

1. CLICK: Bring **Windows PowerShell or the VS Code PowerShell terminal** to the front.

2. LOOK FOR: Confirm the current location matches The repository root C:\Users\User\Desktop\Northstar\_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

#### Command or code (PowerShell):

```
git push -u origin "$(git branch --show-current)"
```

#### Where to enter it:

VS Code integrated PowerShell terminal. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

#### Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

#### What each part means:

- **Line 1:** `git push -u origin "$(git branch --show-current)"` — `git` calls the Git version-control program; `push` sends local commits to a remote repository; `-u` is a command option or flag; its exact behavior is defined beside the command; `origin` the conventional name of the GitHub remote; `"$(git branch --show-current)"` is a quoted literal; the quotation marks preserve spaces or mark text

#### Does it change anything?

This can change files, Git state, packages, database objects, or data.

#### Is it safe to rerun?

Safe to rerun only after reading the idempotency note and confirming that the same batch, file, or object will not be duplicated.

#### What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

#### Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

#### What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

#### How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

#### Do not continue unless:

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

#### Common mistake:

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

#### Exact recovery:

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm

the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

### What you just accomplished:

You executed and checked one controlled operation rather than treating a long script as a black box.

### How this connects to the project:

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 18 lesson index](#)

## Verify on GitHub

1. CLICK: Open the repository page in a browser.
2. CLICK: Open the branch selector above the file list.
3. TYPE THIS: The exact branch name returned locally.
4. CLICK: Select that branch.
5. LOOK FOR: The latest commit message security: protect secrets and document cost controls and the intended changed paths.
6. CLICK: Open each changed file and confirm the GitHub version matches the staged diff.
7. Do not merge solely because the push succeeded; CI and review must pass.

## Push-rejected recovery

If Git says the remote contains work you do not have, do not use `--force`. Run `git fetch origin`, inspect `git log --oneline --graph --decorate --all -20`, then rebase or merge only after understanding the divergence. Resolve conflicts one file at a time, run tests again, and push normally. A rejection protects remote work; it is not permission to overwrite it.

## Explain it in your own words

---

Without copying the model answer, explain:

1. What you created or configured in Phase 18.
2. Why it exists.
3. Where it is located on your computer, in a database, in Databricks, in Power BI, or on GitHub.
4. What information enters it.
5. What information leaves it.
6. How it connects to the next phase.
7. How you verified it.
8. What could cause it to fail.
9. Which decision/tradeoff you could defend in an interview.

## My answer

[WRITE YOUR ANSWER BEFORE READING THE REFERENCE]

## OPTIONAL REFERENCE ANSWER — PHASE 18 TEACH-BACK MODEL

---

Read this only after completing **MY TASK** and using the three hints in order. The model is a learning reference, not evidence of your execution.

“Phase 18 created the verified boundary described by **Secure secrets, control cost, and review operational settings**. It consumes only the outputs accepted from earlier phases, produces a named and auditable handoff, and records enough metadata and tests to detect wrong context, missing data, duplicates, failed rules, or unsafe reruns. I verified the result in its owning application and connected the evidence to Git without claiming that displayed instructions were executed.”

## Mini quiz

---

1. Multiple choice: Why does Phase 18 occur at this point in the source-to-consumption chain? A) Because menu order is arbitrary. B) Because its verified upstream input now exists. C) Because later phases do not depend on it. D) To create portfolio screenshots before validation.
2. True or false: A command that displays no error is automatically verified even when it ran in the wrong folder, database, catalog, schema, branch, or filter context.
3. Fill in the blank: The statement that defines what one row represents is the table or entity \_\_\_\_\_.

4. What command would you use first to confirm the PowerShell current folder before a repository command?
  5. Troubleshooting: Your output differs from the example. What should you check before deleting, overwriting, resetting, force-pushing, or weakening a test?
  6. Design choice: Explain one tradeoff of Track A and one production alternative.
  7. Code reading: Why are input, accepted, rejected, and deduplicated counts recorded separately?
  8. Ownership: Which status may you select only after personally performing and inspecting the verification?
- 

## Mini quiz answer key and explanations

---

1. **B.** This phase is ordered after its prerequisites so its output has a trustworthy input. A is wrong because order is intentional; C is wrong because later phases depend on the handoff; D is wrong because screenshots follow verification.
2. **False.** Lack of an error proves only that the application accepted something; context and independent verification still matter.
3. **Grain.** Grain is the precise meaning of one row. A key identifies a row, but it does not by itself state the row's business meaning.
4. **Get-Location.** It shows the shell's current folder. `git rev-parse --show-toplevel` separately verifies the repository root when inside a clone.
5. Check application, folder/path, branch, server/database, catalog/schema, batch ID, parameters, source/target grain, filter context, version/tier differences, and the first meaningful error. Destructive changes are not a diagnostic step.
6. Track A has manual upload/download boundaries and batch latency. A production alternative is routable private connectivity with cloud object storage/managed warehouse, identities, and automated orchestration.
7. Separate counts make every row outcome explainable. A single final count can hide silent drops, duplicates, or records that moved to quarantine.
8. **Verified by me / VERIFIED BY USER.** `PLANNED`, `CREATED BY USER`, and `RUN BY USER` describe earlier states; only inspected evidence supports verification.

## My Phase 18 Learning Journal

[WRITE YOUR ANSWER]

### What I still need to practice:

[WRITE YOUR ANSWER]

## What your screen should look like now

---

- The phase output and final validation are saved or visible.

- The intended feature branch is still active.
- `git status` is either clean after the commit or lists only deliberately deferred work recorded in the journal.
- The branch exists on GitHub after a successful push.
- No database transaction, Databricks run, loader, test process, or Power BI refresh is still active.
- The next phase's required input is identifiable.

## Lesson 18.5 completion checklist

---

☐

I completed the verification gate with my actual results — [STATUS]

☐

I recorded at least one realistic failure, alternate result, or diagnostic path — [STATUS]

☐

I captured and redacted the required screenshot only after verification — [STATUS]

☐

I reviewed, staged, committed, pushed, and verified only the intended Git changes — [STATUS]

☐

I completed the teach-back, quiz, answer review, and learning journal — [STATUS]

☐

I can name the exact verified handoff to the next phase — [STATUS]

## Safe stopping point

---

All files must be saved. The terminal may be closed after the Git result is recorded. SSMS/pgAdmin may be closed after queries finish and transactions are committed/rolled back. Databricks compute may be stopped when no Job or notebook is running. Power BI may be closed after saving. Resume from the next phase's screen-start checklist and re-verify root, branch, connection, and latest accepted batch.

## How this phase connects to the next phase

---

Phase 19 automates local, infrastructure-free quality checks on every change.

## Phase 18 completion checklist

---

☐

Phase goal explained in my own words — [STATUS]

☐

Required files/objects created by me — [STATUS]

☐

Commands run by me — [STATUS]

☐

Output independently inspected — [STATUS]

☐

Failure/alternate branch understood — [STATUS]

☐

Screenshot captured and redacted — [STATUS]

☐

Targeted Git commit exists — [STATUS]

☐

Branch pushed and verified on GitHub — [STATUS]

☐

Quiz completed before answer key — [STATUS]

☐

Journal completed — [STATUS]

☐

Final phase status manually set — [ ] Not started / [-] In progress / [x] Verified by me / [!] Needs troubleshooting

[Back to the master table of contents](#)

# Phase 19 — Build GitHub Actions continuous integration

[Back to the master table of contents](#)

**Track:** Track A required

**Status when first opened:** PLANNED

**Completion rule:** The phase is not complete because its instructions exist. Mark it VERIFIED BY USER only after you perform the work, inspect the output, and save evidence.

## Why this phase happens now

---

**Earlier work this phase depends on:** A passing CI workflow and reviewable branch history.

**What would go wrong if it happened earlier:** You would create objects without a verified requirement, valid upstream input, protected repository state, or known execution environment.

**Later work that depends on it:** Phase 20 documents only verified work and links each claim to evidence.

**Decision being made:** Choose and verify the simplest local-first method that teaches the professional concept without pretending that local services are publicly reachable.

**Alternatives:** A company could use managed cloud databases, infrastructure as code, service principals, direct JDBC publication, deployment bundles, or streaming. Those options are discussed as tradeoffs, not substituted silently.

**Beginner path selected:** Track A: local SQL Server and PostgreSQL, Python batch extracts, manual governed upload to Databricks, Delta Bronze/Silver/Gold, manual verified export, local SQL Server warehouse, and Power BI Import.

**Reason for the order:** Requirements become source decisions; sources become generated data; source data becomes extraction batches; batches become Bronze; Bronze becomes Silver; Silver becomes Gold; Gold becomes warehouse and Power BI input.

## Phase 19 lesson index

---

1. [Lesson 19.1 — Understand the phase and starting screen](#)
2. [Lesson 19.2 — Perform the notebook-guided actions one at a time](#)
3. [Lesson 19.3 — Create and understand the phase files](#)
4. [Lesson 19.4 — Build and validate required objects](#)
5. [Lesson 19.5 — Verify, troubleshoot, commit, teach back, and stop safely](#)

## Lesson 19.1 — Understand the phase and starting screen

---

### What your screen should look like before starting

---

- **Application open:** VS Code, PowerShell, GitHub repository Actions page, and workflow logs.
- **Window in front:** The application named by the first action; do not keep an installer, database editor, notebook, and Power BI dialog stacked ambiguously.
- **Repository folder:** C:\Users\User\Desktop\Northstar\_Retail\SQL-Data-Warehouse-Project when repository work is required. Verify User on your computer.
- **Git branch:** A feature branch, not a detached commit. Run `git branch --show-current` and record the exact result.
- **Database/workspace connection:** The connection named in the action, not merely the most recent connection.
- **Files that should already exist:** Only files from verified earlier phases. Do not pre-create the full tree.
- **Files that should not exist yet:** New Phase 19 files remain absent until their creation lesson.
- **Terminal prompt:** It should end in the expected repository path or another explicitly named folder.
- **Previous verification:** Phase 18 must be verified when this phase has a prerequisite.

## Three-level explanation of the phase

---

### Level 1 — Child-simple explanation

Imagine building a store from labeled boxes. This phase handles one box, checks that the label is correct, and makes sure the next box receives the right thing. You do not pour all boxes together and hope the result is understandable.

## Level 2 — Northstar Retail project explanation

Phase 19 creates the specific Northstar Retail files, database objects, transformations, tests, model objects, or evidence described in the lessons. Every output keeps a visible connection to its source and batch so you can trace an order, customer, product, campaign, return, shipment, or inventory record.

## Level 3 — Professional explanation

This phase establishes a controlled boundary in an end-to-end batch platform. It defines contracts, execution context, idempotency behavior, quality expectations, evidence, and handoff artifacts so the downstream layer can be reproduced and reviewed independently.

## Applications to open

---

VS Code, PowerShell, GitHub repository Actions page, and workflow logs. Open only the application needed for the immediate action. Extra windows increase the chance of typing a command into the wrong context.

## Phase status gate

---

☐

I changed this phase from [ ] Not started to [-] In progress in the master tracker.

☐

I verified the repository root when repository work is required.

☐

I verified the current branch.

☐

I identified the exact server/database, Databricks workspace/catalog/schema, or Power BI file.

☐

I read the phase ordering explanation.

## What your screen should look like now

---

- The Phase 19 lesson index, starting-screen checklist, and three explanation levels remain visible in this workbook.
- Only the applications required for the next lesson are open; no installer, database transaction, notebook run, or Power BI refresh was started merely to read orientation material.
- The intended repository path, active branch, server/database, Databricks workspace, or Power BI file has been written down when it applies.
- No new Phase 19 project file or object has been created yet unless the lesson explicitly instructed you to create it.
- The Phase 19 master-tracker row is marked [-] In progress only after you personally updated it.

## Lesson 19.1 completion checklist

---

☐

I read why Phase 19 happens now — [STATUS]

☐

I can give the child-simple, Northstar-specific, and professional explanations — [STATUS]

☐

I identified the exact applications and execution context required next — [STATUS]

☐

I verified prerequisites instead of assuming they are complete — [STATUS]

☐

I updated the progress tracker myself — [STATUS]

## Safe stopping point

---

No command, database transaction, Databricks run, loader, or Power BI refresh should be active after this orientation lesson. Save any journal note you created. You may close the workbook viewer and applications. When returning, reopen [Lesson 19.2](#), re-read its starting-screen checklist, and verify the repository root, branch, connection, and workspace before performing an action.

[Back to the Phase 19 lesson index](#)

## Lesson 19.2 — Perform the notebook-guided actions one at a time

### What your screen should look like before starting

The Phase 19 start gate is checked, only the needed application is in front, and the current context has been verified. The following retained lesson material preserves the Northstar terminology and exercise framing; the action cards then turn each hands-on step into a written screen-recording sequence.

### Retained phase lesson, exercises, rules, and expected results

**Track:** Track A required

**Ownership status at start:** Workbook instructions exist; your execution is not yet verified.

**Evidence rule:** Replace placeholders only after the verification steps pass.

### 1. What you are building

A GitHub Actions workflow that runs on pushes and pull requests without paid database or Databricks infrastructure. It validates required files, SQL dialect labels, notebook syntax/JSON, secret patterns, relative Markdown links, Python linting, and deterministic local tests. You also practice branches, pull requests, failed-run diagnosis, and safe merges.

### 2. Why it matters

Continuous integration catches repeatable problems before they reach the main branch. It does not replace human review or external-platform testing, but it makes the repository contract visible and enforceable.

### 3. Words to know

Term	Plain-language definition
CI	Continuous Integration: automatically checking changes when code is pushed or proposed.
CD	Continuous Delivery/Deployment: preparing or releasing approved changes; advanced deployment remains optional here.
Workflow	A YAML file in <code>.github/workflows/</code> that defines automated jobs and steps.
Trigger	An event such as <code>push</code> or <code>pull_request</code> that starts a workflow.
Runner	The temporary machine that executes workflow steps.
Job	A group of steps that runs on one runner.
Step	One action or shell command inside a job.
Action	A reusable GitHub Actions component such as <code>checkout</code> or <code>setup-python</code> .
Artifact	A file retained from a workflow run; not required for this lightweight validation job.
Pull request	A proposed branch merge with review, discussion, and automated checks.
Required check	A status that repository rules can require before merge.
Lint	Static code-style and likely-error checks.
Deterministic test	A test that produces the same result for the same inputs.

### 4. What must already be completed

The project runs locally in a virtual environment, sample generation is deterministic, validation scripts exist, and no test requires a live SQL Server, PostgreSQL, Databricks, or Power BI service in GitHub Actions.

### 5. Applications to open

Application	How to open it	Why it is open
VS Code	Open <code>.github/workflows/validate_project.yml</code> , tests, and validation scripts.	Read and edit the automation.
Windows PowerShell	Open in repository root with <code>.venv</code> active.	Run the exact CI checks locally.

Application	How to open it	Why it is open
GitHub browser	Open repository > Actions and Pull requests.	Inspect runs, logs, checks, and merge state.
Git	Use in PowerShell/VS Code Source Control.	Create branch, commit, push, and update PR.

## 6. Exact click-by-click steps

**Beginner rhythm:** Read the whole step. Confirm the application and location. Perform only that step. Verify the visible result. Record an error before attempting a fix.

## 7. Exact commands, one code block at a time

## 8. Where each command runs

Never infer the execution location from the code language. The command headings above identify the application and folder/database/catalog. Before every PowerShell command, run `Get-Location`; before SQL, verify the selected database; before Spark, print the catalog/schema/batch widgets.

## TEACHING EXAMPLE

The following small example or reference pattern explains the concept before you attempt Northstar-specific work. Read it, then complete **MY TASK** without copying the answer.

### Line-by-line code explanation

Line or action	Meaning	Why it belongs here
<code>python -m scripts.validation.check_required_files</code>	Runs the repository-contract validations used by CI.	Local reproduction is faster and clearer than repeatedly pushing blind fixes.
<code>python -m ruff check scripts tests</code>	Runs static Python checks and all deterministic tests.	The workflow should not be the first place these checks run.
<code>git switch main</code>	Creates a focused feature branch from current main.	GitHub flow isolates work and makes review safer.
<code>git add .github tests scripts/validation docs</code>	Stages selected paths, commits, and publishes the branch.	A pull request requires the branch on GitHub.

### What this workflow proves

It proves the repository can be installed on a clean Python runner; deterministic sample/unit tests pass; required paths exist; SQL files declare their dialect; notebooks parse; simple secret patterns are absent; and relative documentation links resolve. It does **not** prove that SQL Server, PostgreSQL, Databricks Jobs, or Power BI succeeded in your environment. Those require the manual evidence gates in the workbook.

### Failure-reading order

Read the first failed step, the exact command, and the first actionable error. Later errors are often consequences. Reproduce locally, change one cause, rerun the failed command, then rerun the complete suite.

## MY TASK

Run the full workflow locally, open a small pull request, diagnose one intentionally controlled failure, fix it, obtain green checks, review the diff, and merge through GitHub flow without bypassing evidence or adding secrets.

## STARTER SKELETON

```
TODO(USER): explain every line before changing this workflow.
name: Validate Northstar project
on:
 pull_request:
 permissions:
 contents: read
jobs:
 validate:
 runs-on: ubuntu-latest
 steps:
 - uses: actions/checkout@v4
```

```

- uses: actions/setup-python@v5
 with:
 python-version: '3.13'
TODO(USER): install dependencies
TODO(USER): run required-file, dialect, notebook, secret, link, lint, and test checks

```

**Acceptance criteria:** All local checks pass; the pull request displays the expected workflow; a controlled failure is reproduced and fixed; final checks are green; the reviewed diff contains no secrets/generated raw data/false claims; merge and post-merge main check succeed.

## HINT 1 — CONCEPT

A CI failure is a command failure on a clean machine; reproduce the exact command locally first.

## HINT 2 — PSEUDOCODE

Read first red step -> copy command -> run locally -> fix one root cause -> rerun that command -> rerun all.

## HINT 3 — NEAR-COMPLETE PATTERN

Use the existing workflow and validation modules; introduce a reversible broken link or failing assertion on a temporary branch, observe the check, then restore/fix it before merge.

## 13. Expected files or output

- Passing local validation output.
- One focused pull request using the in-workbook template.
- Controlled failed-run screenshot/log note and corrected green run.
- Reviewed Files changed evidence.
- Successful main-branch workflow after merge.

## 14. How to verify

- Workflow YAML parses and appears under GitHub Actions.
- No workflow secret is required for local-only tests.
- Python version and dependency files match project configuration.
- Every CI command can be run locally.
- Controlled failure is real and then removed/fixed.
- PR description distinguishes automated checks from manual platform verification.
- Main remains green after merge.

## 15. Automated tests

- All commands in workflow locally.
- YAML parser/Actions recognition.
- Controlled negative test.
- PR diff secret/generated-file review.
- Post-merge main workflow.

## 16. Common errors and exact fixes

Message/symptom	Likely cause	Exact diagnostic	Safe fix	Verify
Workflow does not appear	File is not under .github/workflows, YAML is invalid, or branch was not pushed.	Check path, git status, remote branch, and YAML indentation.	Move/fix/commit/push the workflow; use spaces, not tabs.	Actions page lists the workflow.
ModuleNotFoundError in Actions	Dependency missing or project root/import path differs.	Read install step and failing import; inspect requirements/pyproject.	Add the legitimate dependency or fix package/import structure; do not install unrelated packages blindly.	Clean local environment and Actions both import it.
Link check fails	A relative path is wrong or referenced file was renamed.	Open the reported Markdown and resolve path relative to that file.	Correct the link or restore the intentional file.	Local link validator and Actions pass.

Message/symptom	Likely cause	Exact diagnostic	Safe fix	Verify
Secret scan fails	Real credential or token-like example is present.	Open exact file/line and check commit history/staged diff.	Rotate real secret and remove it; use unmistakable placeholders for examples.	Scanner passes and no usable secret remains.
PR checks green but project did not run in Databricks	CI scope is local contract only.	Read workflow steps and manual gate checklist.	Do not overclaim; attach separate Databricks/Power BI evidence after execution.	README status accurately distinguishes automated and manual verification.

For deeper tool-specific diagnosis, use [the troubleshooting index near the end of this workbook](#).

## 17. Explain it in your own words

1. What does CI prove in this project and what does it not prove?
2. Why should a failing Actions command be reproduced locally?
3. Why are database credentials not added to this beginner workflow?
4. How does a pull request reduce risk compared with pushing directly to main?

Write your answers in [the learning-journal fields in this phase](the learning-journal fields in this phase). Do not copy the wording above.

## 18. Mini quiz

1. Where must a GitHub Actions workflow file be stored?
2. Which permission does the validation workflow request?
3. What is the first place to look when a workflow fails?

Record your answers before opening the answer key.

## 19. Screenshot checkpoint

Capture local green checks, the controlled red Actions step, the corrected green PR checks, and reviewed Files changed tab. Redact account notifications or private metadata.

Save the image under docs/images/ with a descriptive filename. Check that no credential, token, password, or unnecessary personal account detail is visible.

## 20. Git checkpoint and suggested commit message

Run `git status`, review the Source Control diff in VS Code, stage only the intended files, then commit:

```
ci: validate northstar project contract
```

Push the feature branch only after tests pass.

## 21. Completion checklist

Use one status per item: Not started, In progress, Verified by me, or Needs troubleshooting.

☐

Workflow understood line by line — [STATUS]

☐

All CI commands pass locally — [STATUS]

☐

Feature branch and PR created — [STATUS]

☐

Controlled failure diagnosed — [STATUS]

☐

Fix produced green checks — [STATUS]

☐

Diff reviewed for safety/truthfulness — [STATUS]

☐

PR merged safely — [STATUS]

Main workflow green — [STATUS]

Attempt the task and record what failed before reading the optional reference answer in this phase: [the optional reference-answer section later in this workbook#phase-19](the optional reference-answer section later in this workbook#phase-19). The quiz answer is in [the answer-key section immediately after the quiz in this workbook#phase-19](the answer-key section immediately after the quiz in this workbook#phase-19).

---

**Next phase:** Phase 20 assembles the technical evidence into a professional, truthful portfolio repository.

## Required action cards

---

### Action 19.2.1 — Open `.github/workflows/validate_project.yml`. Read the trigger, permissions, runner, Python version, dependen

---

**Application:**

Windows PowerShell or the VS Code PowerShell terminal

**Window or panel:**

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

**Starting condition:**

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

**Current folder or location:**

The repository root `C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project`. The User segment is an example; verify your real Windows username.

**What you are about to do:**

Open `.github/workflows/validate_project.yml`. Read the trigger, permissions, runner, Python version, dependency install, and each named validation step.

**Why this action comes now:**

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

**Exact physical actions:**

1. Bring the application named above to the front and confirm that no unrelated window has focus.
2. Read the starting condition and compare it with what is visible on your screen.
3. Perform only this immediate task: Open `.github/workflows/validate_project.yml`. Read the trigger, permissions, runner, Python version, dependency install, and each named validation step.
4. Pause while the application finishes the operation; do not click the same control twice.
5. Inspect the visible result before changing another file, object, or setting.
6. Record the actual result in the verification field for this action.

**Command or code:**

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

**Where to enter it:**

Windows PowerShell or the VS Code PowerShell terminal. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

**What each part means:**

#### Step 1

**Action**

Open `.github/workflows/validate_project.yml`. Read the trigger, permissions, runner, Python version, dependency install, and each named validation step.

**Before continuing**

I used the application named in this phase.

☐

I confirmed the current folder/database/catalog/schema.

☐

I can describe what changed on the screen or filesystem.

☐

I know which later verification proves this step worked.

**What should happen:**

A visible file, folder, branch, connection, table, notebook, task, relationship, measure, visual, or verification result should appear exactly where the action predicts.

**Expected example:**

Your exact values may differ. The expected result is the same *type* of object and the same required status, not necessarily the same timestamps, row counts, colors, generated IDs, or screen dimensions.

**What may look different:**

Menu wording can vary by product release or account tier. Use the official-source register and look for the described object rather than guessing from an old screenshot.

**How to verify success:**

Reopen or refresh the relevant panel, locate the named object, and inspect the property or output that proves it exists and is in the intended location.

**Do not continue unless:**

You can point to the visible result and explain what it proves. Mark the action VERIFIED BY USER only after that check.

**Common mistake:**

Combining several clicks or decisions, choosing a similarly named object, or continuing because no error dialog appeared.

**Exact recovery:**

Stop at the current screen. Save a screenshot of the error if useful, hide sensitive values, and compare the selected location with the starting condition. Use Back or Cancel rather than Delete or Overwrite. Correct one mismatch and repeat only this action.

**What you just accomplished:**

You completed one observable piece of the Northstar Retail platform and established a checkpoint that can be audited later.

**How this connects to the project:**

The resulting object, decision, or evidence becomes an input to the next stage in the source-to-consumption chain.

[Back to the Phase 19 lesson index](#)

## Action 19.2.2 — Confirm the workflow uses contents: read and does not require repository secrets. Do not add database passwo

**Application:**

Visual Studio Code

**Window or panel:**

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

**Starting condition:**

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

**Current folder or location:**

The repository root C:\Users\User\Desktop\Northstar\_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username.

**What you are about to do:**

Confirm the workflow uses contents: read and does not require repository secrets. Do not add database passwo. This is one bounded construction or inspection task.

**Why this action comes now:**

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

**Exact physical actions:**

1. Bring the application named above to the front and confirm that no unrelated window has focus.
2. Read the starting condition and compare it with what is visible on your screen.
3. Perform only this immediate task: Confirm the workflow uses contents: read and does not require repository secrets. Do not add database passwords merely to make cloud CI imitate local integration tests.
4. Pause while the application finishes the operation; do not click the same control twice.
5. Inspect the visible result before changing another file, object, or setting.
6. Record the actual result in the verification field for this action.

**Command or code:**

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

**Where to enter it:**

Visual Studio Code. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

**What each part means:****Step 2****Action**

Confirm the workflow uses contents: read and does not require repository secrets. Do not add database passwords merely to make cloud CI imitate local integration tests.

**Before continuing**☐

I used the application named in this phase.

☐

I confirmed the current folder/database/catalog/schema.

☐

I can describe what changed on the screen or filesystem.

☐

I know which later verification proves this step worked.

**What should happen:**

A visible file, folder, branch, connection, table, notebook, task, relationship, measure, visual, or verification result should appear exactly where the action predicts.

**Expected example:**

Your exact values may differ. The expected result is the same *type* of object and the same required status, not necessarily the same timestamps, row counts, colors, generated IDs, or screen dimensions.

**What may look different:**

Menu wording can vary by product release or account tier. Use the official-source register and look for the described object rather than guessing from an old screenshot.

**How to verify success:**

Reopen or refresh the relevant panel, locate the named object, and inspect the property or output that proves it exists and is in the intended location.

**Do not continue unless:**

You can point to the visible result and explain what it proves. Mark the action VERIFIED BY USER only after that check.

**Common mistake:**

Combining several clicks or decisions, choosing a similarly named object, or continuing because no error dialog appeared.

**Exact recovery:**

Stop at the current screen. Save a screenshot of the error if useful, hide sensitive values, and compare the selected location with the starting condition. Use Back or Cancel rather than Delete or Overwrite. Correct one mismatch and repeat only this action.

**What you just accomplished:**

You completed one observable piece of the Northstar Retail platform and established a checkpoint that can be audited later.

**How this connects to the project:**

The resulting object, decision, or evidence becomes an input to the next stage in the source-to-consumption chain.

## Action 19.2.3 — In PowerShell, activate .venv and run each workflow command locally in the same order. Fix the first failure

---

**Application:**

Windows PowerShell or the VS Code PowerShell terminal

**Window or panel:**

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

**Starting condition:**

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

**Current folder or location:**

The repository root C:\Users\User\Desktop\Northstar\_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username.

**What you are about to do:**

In PowerShell, activate .venv and run each workflow command locally in the same order. Fix the first failure. This is one bounded construction or inspection task.

**Why this action comes now:**

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

**Exact physical actions:**

1. Bring the application named above to the front and confirm that no unrelated window has focus.
2. Read the starting condition and compare it with what is visible on your screen.
3. Perform only this immediate task: In PowerShell, activate .venv and run each workflow command locally in the same order. Fix the first failure rather than continuing blindly.
4. Pause while the application finishes the operation; do not click the same control twice.
5. Inspect the visible result before changing another file, object, or setting.
6. Record the actual result in the verification field for this action.

**Command or code:**

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

**Where to enter it:**

Windows PowerShell or the VS Code PowerShell terminal. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

**What each part means:**

### Step 3

**Action**

In PowerShell, activate .venv and run each workflow command locally in the same order. Fix the first failure rather than continuing blindly.

**Before continuing**☐

I used the application named in this phase.

☐

I confirmed the current folder/database/catalog/schema.

☐

I can describe what changed on the screen or filesystem.

I know which later verification proves this step worked.

**What should happen:**

A visible file, folder, branch, connection, table, notebook, task, relationship, measure, visual, or verification result should appear exactly where the action predicts.

**Expected example:**

Your exact values may differ. The expected result is the same *type* of object and the same required status, not necessarily the same timestamps, row counts, colors, generated IDs, or screen dimensions.

**What may look different:**

Menu wording can vary by product release or account tier. Use the official-source register and look for the described object rather than guessing from an old screenshot.

**How to verify success:**

Reopen or refresh the relevant panel, locate the named object, and inspect the property or output that proves it exists and is in the intended location.

**Do not continue unless:**

You can point to the visible result and explain what it proves. Mark the action VERIFIED BY USER only after that check.

**Common mistake:**

Combining several clicks or decisions, choosing a similarly named object, or continuing because no error dialog appeared.

**Exact recovery:**

Stop at the current screen. Save a screenshot of the error if useful, hide sensitive values, and compare the selected location with the starting condition. Use Back or Cancel rather than Delete or Overwrite. Correct one mismatch and repeat only this action.

**What you just accomplished:**

You completed one observable piece of the Northstar Retail platform and established a checkpoint that can be audited later.

**How this connects to the project:**

The resulting object, decision, or evidence becomes an input to the next stage in the source-to-consumption chain.

[Back to the Phase 19 lesson index](#)

## Action 19.2.4 — Open the tests and identify what is unit, integration-contract, data-quality-fixture, and reconciliation. Note

**Application:**

Databricks workspace in a web browser

**Window or panel:**

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

**Starting condition:**

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

**Current folder or location:**

The repository root C:\Users\User\Desktop\Northstar\_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username.

**What you are about to do:**

Open the tests and identify what is unit, integration-contract, data-quality-fixture, and reconciliation. Note. This is one bounded construction or inspection task.

**Why this action comes now:**

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

**Exact physical actions:**

1. Bring the application named above to the front and confirm that no unrelated window has focus.
2. Read the starting condition and compare it with what is visible on your screen.

3. Perform only this immediate task: Open the tests and identify what is unit, integration-contract, data-quality-fixture, and reconciliation. Note that these tests validate repository fixtures and reference patterns, not a live Databricks run.
4. Pause while the application finishes the operation; do not click the same control twice.
5. Inspect the visible result before changing another file, object, or setting.
6. Record the actual result in the verification field for this action.

**Command or code:**

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

**Where to enter it:**

Databricks workspace in a web browser. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

**What each part means:****Step 4****Action**

Open the tests and identify what is unit, integration-contract, data-quality-fixture, and reconciliation. Note that these tests validate repository fixtures and reference patterns, not a live Databricks run.

**Before continuing**☐

I used the application named in this phase.

☐

I confirmed the current folder/database/catalog/schema.

☐

I can describe what changed on the screen or filesystem.

☐

I know which later verification proves this step worked.

**What should happen:**

A visible file, folder, branch, connection, table, notebook, task, relationship, measure, visual, or verification result should appear exactly where the action predicts.

**Expected example:**

Your exact values may differ. The expected result is the same *type* of object and the same required status, not necessarily the same timestamps, row counts, colors, generated IDs, or screen dimensions.

**What may look different:**

Menu wording can vary by product release or account tier. Use the official-source register and look for the described object rather than guessing from an old screenshot.

**How to verify success:**

Reopen or refresh the relevant panel, locate the named object, and inspect the property or output that proves it exists and is in the intended location.

**Do not continue unless:**

You can point to the visible result and explain what it proves. Mark the action VERIFIED BY USER only after that check.

**Common mistake:**

Combining several clicks or decisions, choosing a similarly named object, or continuing because no error dialog appeared.

**Exact recovery:**

Stop at the current screen. Save a screenshot of the error if useful, hide sensitive values, and compare the selected location with the starting condition. Use Back or Cancel rather than Delete or Overwrite. Correct one mismatch and repeat only this action.

**What you just accomplished:**

You completed one observable piece of the Northstar Retail platform and established a checkpoint that can be audited later.

**Common mistake:**

Combining several clicks or decisions, choosing a similarly named object, or continuing because no error dialog appeared.

**Exact recovery:**

Stop at the current screen. Save a screenshot of the error if useful, hide sensitive values, and compare the selected location with the starting condition. Use Back or Cancel rather than Delete or Overwrite. Correct one mismatch and repeat only this action.

**What you just accomplished:**

You completed one observable piece of the Northstar Retail platform and established a checkpoint that can be audited later.

**How this connects to the project:**

The resulting object, decision, or evidence becomes an input to the next stage in the source-to-consumption chain.

[Back to the Phase 19 lesson index](#)

## Action 19.2.8 — Push the fix to the same branch. Confirm the PR updates automatically and all checks turn green.

---

**Application:**

Visual Studio Code

**Window or panel:**

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

**Starting condition:**

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

**Current folder or location:**

The repository root C:\Users\User\Desktop\Northstar\_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username.

**What you are about to do:**

Push the fix to the same branch. Confirm the PR updates automatically and all checks turn green. This is one bounded construction or inspection task.

**Why this action comes now:**

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

**Exact physical actions:**

1. Bring the application named above to the front and confirm that no unrelated window has focus.
2. Read the starting condition and compare it with what is visible on your screen.
3. Perform only this immediate task: Push the fix to the same branch. Confirm the PR updates automatically and all checks turn green.
4. Pause while the application finishes the operation; do not click the same control twice.
5. Inspect the visible result before changing another file, object, or setting.
6. Record the actual result in the verification field for this action.

**Command or code:**

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

**Where to enter it:**

Visual Studio Code. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

## What each part means:

### Step 8

#### Action

Push the fix to the same branch. Confirm the PR updates automatically and all checks turn green.

#### Before continuing

☐

I used the application named in this phase.

☐

I confirmed the current folder/database/catalog/schema.

☐

I can describe what changed on the screen or filesystem.

☐

I know which later verification proves this step worked.

#### What should happen:

A visible file, folder, branch, connection, table, notebook, task, relationship, measure, visual, or verification result should appear exactly where the action predicts.

#### Expected example:

Your exact values may differ. The expected result is the same *type* of object and the same required status, not necessarily the same timestamps, row counts, colors, generated IDs, or screen dimensions.

#### What may look different:

Menu wording can vary by product release or account tier. Use the official-source register and look for the described object rather than guessing from an old screenshot.

#### How to verify success:

Reopen or refresh the relevant panel, locate the named object, and inspect the property or output that proves it exists and is in the intended location.

#### Do not continue unless:

You can point to the visible result and explain what it proves. Mark the action VERIFIED BY USER only after that check.

#### Common mistake:

Combining several clicks or decisions, choosing a similarly named object, or continuing because no error dialog appeared.

#### Exact recovery:

Stop at the current screen. Save a screenshot of the error if useful, hide sensitive values, and compare the selected location with the starting condition. Use Back or Cancel rather than Delete or Overwrite. Correct one mismatch and repeat only this action.

#### What you just accomplished:

You completed one observable piece of the Northstar Retail platform and established a checkpoint that can be audited later.

#### How this connects to the project:

The resulting object, decision, or evidence becomes an input to the next stage in the source-to-consumption chain.

## Action 19.2.9 — Review the Files changed tab for secrets, generated data, unrelated edits, false claims, and broken paths. Mer

#### Application:

Visual Studio Code

#### Window or panel:

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

#### Starting condition:

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

**Current folder or location:**

The repository root C:\Users\User\Desktop\Northstar\_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username.

**What you are about to do:**

Review the Files changed tab for secrets, generated data, unrelated edits, false claims, and broken paths. Merge. This is one bounded construction or inspection task.

**Why this action comes now:**

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

**Exact physical actions:**

1. Bring the application named above to the front and confirm that no unrelated window has focus.
2. Read the starting condition and compare it with what is visible on your screen.
3. Perform only this immediate task: Review the Files changed tab for secrets, generated data, unrelated edits, false claims, and broken paths. Merge only after review and required checks pass.
4. Pause while the application finishes the operation; do not click the same control twice.
5. Inspect the visible result before changing another file, object, or setting.
6. Record the actual result in the verification field for this action.

**Command or code:**

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

**Where to enter it:**

Visual Studio Code. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

**What each part means:****Step 9****Action**

Review the Files changed tab for secrets, generated data, unrelated edits, false claims, and broken paths. Merge only after review and required checks pass.

**Before continuing**☐

I used the application named in this phase.

☐

I confirmed the current folder/database/catalog/schema.

☐

I can describe what changed on the screen or filesystem.

☐

I know which later verification proves this step worked.

**What should happen:**

A visible file, folder, branch, connection, table, notebook, task, relationship, measure, visual, or verification result should appear exactly where the action predicts.

**Expected example:**

Your exact values may differ. The expected result is the same *type* of object and the same required status, not necessarily the same timestamps, row counts, colors, generated IDs, or screen dimensions.

**What may look different:**

Menu wording can vary by product release or account tier. Use the official-source register and look for the described object rather than guessing from an old screenshot.

**How to verify success:**

Reopen or refresh the relevant panel, locate the named object, and inspect the property or output that proves it exists and is in the intended location.

**Do not continue unless:**

You can point to the visible result and explain what it proves. Mark the action VERIFIED BY USER only after that check.

**Common mistake:**

Combining several clicks or decisions, choosing a similarly named object, or continuing because no error dialog appeared.

**Exact recovery:**

Stop at the current screen. Save a screenshot of the error if useful, hide sensitive values, and compare the selected location with the starting condition. Use Back or Cancel rather than Delete or Overwrite. Correct one mismatch and repeat only this action.

**What you just accomplished:**

You completed one observable piece of the Northstar Retail platform and established a checkpoint that can be audited later.

**How this connects to the project:**

The resulting object, decision, or evidence becomes an input to the next stage in the source-to-consumption chain.

## Action 19.2.10 — After merge, switch to main, pull, delete the local feature branch, and confirm the main-branch workflow suc

---

**Application:**

Visual Studio Code

**Window or panel:**

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

**Starting condition:**

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

**Current folder or location:**

The repository root C:\Users\User\Desktop\Northstar\_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username.

**What you are about to do:**

After merge, switch to main, pull, delete the local feature branch, and confirm the main-branch workflow suc. This is one bounded construction or inspection task.

**Why this action comes now:**

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

**Exact physical actions:**

1. Bring the application named above to the front and confirm that no unrelated window has focus.
2. Read the starting condition and compare it with what is visible on your screen.
3. Perform only this immediate task: After merge, switch to main, pull, delete the local feature branch, and confirm the main-branch workflow succeeds.
4. Pause while the application finishes the operation; do not click the same control twice.
5. Inspect the visible result before changing another file, object, or setting.
6. Record the actual result in the verification field for this action.

**Command or code:**

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

**Where to enter it:**

Visual Studio Code. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

**What each part means:**

### Step 10

**Action**

After merge, switch to main, pull, delete the local feature branch, and confirm the main-branch workflow succeeds.

**Before continuing**

I used the application named in this phase.

☐

I confirmed the current folder/database/catalog/schema.

☐

I can describe what changed on the screen or filesystem.

☐

I know which later verification proves this step worked.

**What should happen:**

A visible file, folder, branch, connection, table, notebook, task, relationship, measure, visual, or verification result should appear exactly where the action predicts.

## Action 19.2.12 — Keep deployment to Databricks/SQL Server optional. A later Declarative Automation Bundle or cloud deployment m

---

**Application:**

Databricks workspace in a web browser

**Window or panel:**

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

**Starting condition:**

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

**Current folder or location:**

The repository root C:\Users\User\Desktop\Northstar\_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username.

**What you are about to do:**

Keep deployment to Databricks/SQL Server optional. A later Declarative Automation Bundle or cloud deployment m. This is one bounded construction or inspection task.

**Why this action comes now:**

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

**Exact physical actions:**

1. Bring the application named above to the front and confirm that no unrelated window has focus.
2. Read the starting condition and compare it with what is visible on your screen.
3. Perform only this immediate task: Keep deployment to Databricks/SQL Server optional. A later Declarative Automation Bundle or cloud deployment must use environment identities/secrets and separate validation/deployment stages.
4. Pause while the application finishes the operation; do not click the same control twice.
5. Inspect the visible result before changing another file, object, or setting.
6. Record the actual result in the verification field for this action.

**Command or code:**

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

**Where to enter it:**

Databricks workspace in a web browser. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

**What each part means:**

### Step 12

**Action**

Keep deployment to Databricks/SQL Server optional. A later Declarative Automation Bundle or cloud deployment must use environment identities/secrets and separate validation/deployment stages.

**Before continuing**☐

I used the application named in this phase.

☐

I confirmed the current folder/database/catalog/schema.

☐

I can describe what changed on the screen or filesystem.

I know which later verification proves this step worked.

**What should happen:**

A visible file, folder, branch, connection, table, notebook, task, relationship, measure, visual, or verification result should appear exactly where the action predicts.

**Expected example:**

Your exact values may differ. The expected result is the same *type* of object and the same required status, not necessarily the same timestamps, row counts, colors, generated IDs, or screen dimensions.

**What may look different:**

Menu wording can vary by product release or account tier. Use the official-source register and look for the described object rather than guessing from an old screenshot.

Combining several clicks or decisions, choosing a similarly named object, or continuing because no error dialog appeared.

**Exact recovery:**

Stop at the current screen. Save a screenshot of the error if useful, hide sensitive values, and compare the selected location with the starting condition. Use Back or Cancel rather than Delete or Overwrite. Correct one mismatch and repeat only this action.

**What you just accomplished:**

You completed one observable piece of the Northstar Retail platform and established a checkpoint that can be audited later.

**How this connects to the project:**

The resulting object, decision, or evidence becomes an input to the next stage in the source-to-consumption chain.

[Back to the Phase 19 lesson index](#)

## Action 19.2.C1 — Windows PowerShell

**Application:**

Windows PowerShell or the VS Code PowerShell terminal

**Window or panel:**

Windows PowerShell

**Starting condition:**

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

**Current folder or location:**

The repository root C:\Users\User\Desktop\Northstar\_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username.

**What you are about to do:**

Run one explained Powershell instruction and inspect its result before any next command is introduced.

**Why this action comes now:**

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

**Exact physical actions:**

1. CLICK: Bring **Windows PowerShell or the VS Code PowerShell terminal** to the front.
2. LOOK FOR: Confirm the current location matches The repository root C:\Users\User\Desktop\Northstar\_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username. or the more specific location stated below.

3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

#### Command or code (Powershell):

```
python -m scripts.validation.check_required_files
```

#### Where to enter it:

Windows PowerShell. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

#### Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

#### What each part means:

- **Line 1:** `python -m scripts.validation.check_required_files` — `python` invokes Python when that command name is registered; `-m` asks Python to run an installed module; `scripts.validation.check_required_files` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation

#### Does it change anything?

This is intended to inspect or validate state rather than change it.

#### Is it safe to rerun?

Normally safe to rerun because it is observational, but still confirm the execution location first.

#### What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

#### Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

#### What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

#### How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

#### Do not continue unless:

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

#### Common mistake:

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

#### Exact recovery:

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

#### What you just accomplished:

You executed and checked one controlled operation rather than treating a long script as a black box.

**How this connects to the project:**

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 19 lesson index](#)

## Action 19.2.C2 — Windows PowerShell

---

**Application:**

Windows PowerShell or the VS Code PowerShell terminal

**Window or panel:**

Windows PowerShell

**Starting condition:**

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

**Current folder or location:**

The repository root C:\Users\User\Desktop\Northstar\_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username.

**What you are about to do:**

Run one explained Powershell instruction and inspect its result before any next command is introduced.

**Why this action comes now:**

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

**Exact physical actions:**

1. CLICK: Bring **Windows PowerShell or the VS Code PowerShell terminal** to the front.
2. LOOK FOR: Confirm the current location matches The repository root C:\Users\User\Desktop\Northstar\_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

**Command or code (Powershell):**

```
python -m scripts.validation.validate_sql_dialects
```

**Where to enter it:**

Windows PowerShell. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

**Plain-English translation:**

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

**What each part means:**

- **Line 1:** `python -m scripts.validation.validate_sql_dialects` — python invokes Python when that command name is registered; `-m` asks Python to run an installed module; `scripts.validation.validate_sql_dialects` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation

**Does it change anything?**

This is intended to inspect or validate state rather than change it.

**Is it safe to rerun?**

## Action 19.2.C3 — Windows PowerShell

**Application:**

Databricks workspace in a web browser

**Window or panel:**

Windows PowerShell

**Starting condition:**

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

**Current folder or location:**

The repository root `C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project`. The User segment is an example; verify your real Windows username.

**What you are about to do:**

Run one explained Powershell instruction and inspect its result before any next command is introduced.

**Why this action comes now:**

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

**Exact physical actions:**

1. CLICK: Bring **Databricks workspace in a web browser** to the front.

2. LOOK FOR: Confirm the current location matches The repository root C:\Users\User\Desktop\Northstar\_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

#### Command or code (Powershell):

```
python -m scripts.validation.validate_notebooks
```

#### Where to enter it:

Windows PowerShell. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

#### Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

#### What each part means:

- **Line 1:** `python -m scripts.validation.validate_notebooks` — `python` invokes Python when that command name is registered; `-m` asks Python to run an installed module; `scripts.validation.validate_notebooks` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation

#### Does it change anything?

This is intended to inspect or validate state rather than change it.

#### Is it safe to rerun?

Normally safe to rerun because it is observational, but still confirm the execution location first.

#### What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

#### Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

#### What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

#### How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

#### Do not continue unless:

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

#### Common mistake:

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

#### Exact recovery:

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

**What you just accomplished:**

You executed and checked one controlled operation rather than treating a long script as a black box.

**How this connects to the project:**

This verified state becomes a dependable input to the next Northstar Retail construction action.

## Action 19.2.C4 — Windows PowerShell

---

**Application:**

Windows PowerShell or the VS Code PowerShell terminal

**Window or panel:**

Windows PowerShell

**Starting condition:**

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

**Current folder or location:**

The repository root C:\Users\User\Desktop\Northstar\_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username.

**What you are about to do:**

Run one explained Powershell instruction and inspect its result before any next command is introduced.

**Why this action comes now:**

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

**Exact physical actions:**

1. CLICK: Bring **Windows PowerShell or the VS Code PowerShell terminal** to the front.
2. LOOK FOR: Confirm the current location matches The repository root C:\Users\User\Desktop\Northstar\_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

**Command or code (Powershell):**

```
python -m scripts.validation.scan_secrets
```

**Where to enter it:**

Windows PowerShell. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

**Plain-English translation:**

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

**What each part means:**

- **Line 1:** `python -m scripts.validation.scan_secrets` — python invokes Python when that command name is registered; `-m` asks Python to run an installed module; `scripts.validation.scan_secrets` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation

**Does it change anything?**

This is intended to inspect or validate state rather than change it.

**Is it safe to rerun?**

Normally safe to rerun because it is observational, but still confirm the execution location first.

**What should happen:**

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

**Expected example:**

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

**What may look different:**

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

**How to verify success:**

Run or perform the smallest independent check named in the lesson. For a path, use Get-Location or Test-Path; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

**Do not continue unless:**

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

**Common mistake:**

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

**Exact recovery:**

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

**What you just accomplished:**

You executed and checked one controlled operation rather than treating a long script as a black box.

**How this connects to the project:**

This verified state becomes a dependable input to the next Northstar Retail construction action.

## Action 19.2.C10 — Windows PowerShell

---

**Application:**

Windows PowerShell or the VS Code PowerShell terminal

**Window or panel:**

Windows PowerShell

**Starting condition:**

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

**Current folder or location:**

The repository root C:\Users\User\Desktop\Northstar\_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username.

**What you are about to do:**

Run one explained Powershell instruction and inspect its result before any next command is introduced.

**Why this action comes now:**

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

**Exact physical actions:**

1. CLICK: Bring **Windows PowerShell or the VS Code PowerShell terminal** to the front.
2. LOOK FOR: Confirm the current location matches The repository root C:\Users\User\Desktop\Northstar\_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

**Command or code (Powershell):**

```
git switch -c docs/phase-19-ci-evidence
```

**Where to enter it:**

Windows PowerShell. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

**Plain-English translation:**

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

**What each part means:**

- **Line 1:** `git switch -c docs/phase-19-ci-evidence` — `git` calls the Git version-control program; `switch` changes the active branch; `-c` creates the named branch before switching; `docs` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `/` is a path, relative location, branch-style name, or file argument; verify every character before running it; `phase-19-ci-evidence` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation

**Does it change anything?**

This is intended to inspect or validate state rather than change it.

**Is it safe to rerun?**

Normally safe to rerun because it is observational, but still confirm the execution location first.

**What should happen:**

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

**Expected example:**

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

**What may look different:**

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

**How to verify success:**

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

**Do not continue unless:**

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

**Common mistake:**

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

**Exact recovery:**

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

**What you just accomplished:**

You executed and checked one controlled operation rather than treating a long script as a black box.

**How this connects to the project:**

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 19 lesson index](#)

## Action 19.2.C11 — Windows PowerShell

**Application:**

Windows PowerShell or the VS Code PowerShell terminal

**Window or panel:**

Windows PowerShell

**Starting condition:**

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

**Current folder or location:**

The repository root `C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project`. The User segment is an example; verify your real Windows username.

**What you are about to do:**

Run one explained Powershell instruction and inspect its result before any next command is introduced.

**Why this action comes now:**

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

**Exact physical actions:**

1. CLICK: Bring **Windows PowerShell or the VS Code PowerShell terminal** to the front.

2. LOOK FOR: Confirm the current location matches The repository root C:\Users\User\Desktop\Northstar\_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

#### Command or code (Powershell):

```
git add .github tests scripts/validation docs
```

#### Where to enter it:

Windows PowerShell. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

#### Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

#### What each part means:

- **Line 1:** `git add .github tests scripts/validation docs` — `git` calls the Git version-control program; `add` moves selected changes into the staging area; `.` is a path, relative location, branch-style name, or file argument; verify every character before running it; `github` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `tests` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `scripts` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `/` is a path, relative location, branch-style name, or file argument; verify every character before running it; `validation` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `docs` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation

#### Does it change anything?

This can change files, Git state, packages, database objects, or data.

#### Is it safe to rerun?

Safe to rerun only after reading the idempotency note and confirming that the same batch, file, or object will not be duplicated.

#### What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

#### Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

#### What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

#### How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use Get-Location or Test-Path; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

#### Do not continue unless:

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

**Common mistake:**

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

**Exact recovery:**

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

**What you just accomplished:**

You executed and checked one controlled operation rather than treating a long script as a black box.

**How this connects to the project:**

This verified state becomes a dependable input to the next Northstar Retail construction action.

## Action 19.2.C12 — Windows PowerShell

---

**Application:**

Windows PowerShell or the VS Code PowerShell terminal

**Window or panel:**

Windows PowerShell

**Starting condition:**

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

**Current folder or location:**

The repository root C:\Users\User\Desktop\Northstar\_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username.

**What you are about to do:**

Run one explained Powershell instruction and inspect its result before any next command is introduced.

**Why this action comes now:**

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

**Exact physical actions:**

1. CLICK: Bring **Windows PowerShell or the VS Code PowerShell terminal** to the front.
2. LOOK FOR: Confirm the current location matches The repository root C:\Users\User\Desktop\Northstar\_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

**Command or code (Powershell):**

```
git status
```

**Where to enter it:**

Windows PowerShell. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

**Plain-English translation:**

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

### What each part means:

- **Line 1:** `git status` — `git` calls the Git version-control program; `status` shows tracked, staged, modified, and untracked work

### Does it change anything?

This is intended to inspect or validate state rather than change it.

### Is it safe to rerun?

Normally safe to rerun because it is observational, but still confirm the execution location first.

### What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

### Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

### What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

### How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

### Do not continue unless:

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

### Common mistake:

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

### Exact recovery:

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

### What you just accomplished:

You executed and checked one controlled operation rather than treating a long script as a black box.

### How this connects to the project:

This verified state becomes a dependable input to the next Northstar Retail construction action.

## Action 19.2.C13 — Windows PowerShell

### Application:

Windows PowerShell or the VS Code PowerShell terminal

### Window or panel:

Windows PowerShell

### Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

### Current folder or location:

The repository root `C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project`. The User segment is an example; verify your real Windows username.

### What you are about to do:

Run one explained Powershell instruction and inspect its result before any next command is introduced.

### Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

### Exact physical actions:

1. CLICK: Bring **Windows PowerShell or the VS Code PowerShell terminal** to the front.
2. LOOK FOR: Confirm the current location matches The repository root C:\Users\User\Desktop\Northstar\_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

### Command or code (Powershell):

```
git commit -m "ci: validate northstar project contract"
```

### Where to enter it:

Windows PowerShell. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

### Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

### What each part means:

- **Line 1:** `git commit -m "ci: validate northstar project contract"` — `git` calls the Git version-control program; `commit` records the staged snapshot; `-m` asks Python to run an installed module; `"ci: validate northstar project contract"` is a quoted literal; the quotation marks preserve spaces or mark text

### Does it change anything?

This can change files, Git state, packages, database objects, or data.

### Is it safe to rerun?

Safe to rerun only after reading the idempotency note and confirming that the same batch, file, or object will not be duplicated.

### What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

### Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

### What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

### How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

### Do not continue unless:

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

**Common mistake:**

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

## Action 19.2.C14 — Windows PowerShell

---

**Application:**

Windows PowerShell or the VS Code PowerShell terminal

**Window or panel:**

Windows PowerShell

**Starting condition:**

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

**Current folder or location:**

The repository root C:\Users\User\Desktop\Northstar\_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username.

**What you are about to do:**

Run one explained Powershell instruction and inspect its result before any next command is introduced.

**Why this action comes now:**

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

**Exact physical actions:**

1. CLICK: Bring **Windows PowerShell or the VS Code PowerShell terminal** to the front.
2. LOOK FOR: Confirm the current location matches The repository root C:\Users\User\Desktop\Northstar\_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

**Command or code (Powershell):**

```
git push -u origin docs/phase-19-ci-evidence
```

**Where to enter it:**

Windows PowerShell. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

**Plain-English translation:**

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

### What each part means:

- **Line 1:** `git push -u origin docs/phase-19-ci-evidence` — `git` calls the Git version-control program; `push` sends local commits to a remote repository; `-u` is a command option or flag; its exact behavior is defined beside the command; `origin` the conventional name of the GitHub remote; `docs` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `/` is a path, relative location, branch-style name, or file argument; verify every character before running it; `phase-19-ci-evidence` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation

### Does it change anything?

This can change files, Git state, packages, database objects, or data.

### Is it safe to rerun?

Safe to rerun only after reading the idempotency note and confirming that the same batch, file, or object will not be duplicated.

### What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

### Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

### What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

### How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

### Do not continue unless:

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

### Common mistake:

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

### Exact recovery:

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

### What you just accomplished:

You executed and checked one controlled operation rather than treating a long script as a black box.

### How this connects to the project:

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 19 lesson index](#)

## What your screen should look like now

Each action you actually performed has a visible result and a recorded ownership status. You have not marked unrun reference commands as complete. The branch, connection, batch, and application context remain known.

## Lesson 19.2 completion checklist

☐

I performed actions in order — [STATUS]

☐

I verified each command location — [STATUS]

I distinguished typed text from observed output — [STATUS]

I recorded differences caused by versions/tier — [STATUS]

I stopped at the first unexplained error — [STATUS]

## Safe stopping point

---

Save open work and record the next action number. Close an application only after its operation is complete. On return, re-open the Phase 19 starting-screen checklist and re-verify the active context.

## Lesson 19.3 — Create and understand the phase files

---

### What your screen should look like before starting

---

VS Code Explorer shows the repository root, the intended feature branch is active, and no Phase 19 file is assumed to exist merely because a reference answer appears below. Create each folder only when its first file is needed.

#### Folder introduction — .github/

**Exact folder name:** .github

**Exact parent:** repository root

**Why it is needed now:** Phase 19 is about to place its first responsibility-specific file here; creating it earlier would have produced an unexplained empty structure.

**What will eventually be inside:** Only files whose purpose matches this folder's name.

**Why another folder is not appropriate:** Separation keeps source SQL, transformations, tests, configuration, documentation, and generated artifacts reviewable.

**Naming rules:** Preserve lowercase/uppercase exactly as shown. Hyphens, underscores, spaces, and plural forms create different paths. This project avoids spaces in technical folder names.

#### VS Code method

1. CLICK: Open Explorer in VS Code.
2. LOOK FOR: Confirm the repository root is the top folder.
3. Expand the parent path repository root one level at a time.
4. RIGHT-CLICK: Right-click the immediate parent folder.
5. CLICK: **New Folder**.
6. TYPE THIS: .github.
7. PRESS: Enter.
8. LOOK FOR: The folder appears once, at the correct indentation level.

#### PowerShell method

### Action 19.D1.1 — Create the folder .github

---

#### Application:

Windows PowerShell or the VS Code PowerShell terminal

#### Window or panel:

VS Code integrated PowerShell terminal at the repository root

#### Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

#### Current folder or location:

The repository root C:\Users\User\Desktop\Northstar\_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username.

#### What you are about to do:

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

### Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

### Exact physical actions:

1. CLICK: Bring **Windows PowerShell or the VS Code PowerShell terminal** to the front.
2. LOOK FOR: Confirm the current location matches The repository root C:\Users\User\Desktop\Northstar\_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

### Command or code (PowerShell):

```
New-Item -ItemType Directory -Path ".\github" -ErrorAction Stop
```

### Where to enter it:

VS Code integrated PowerShell terminal at the repository root. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

### Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

### What each part means:

- **Line 1:** New-Item -ItemType Directory -Path ".\github" -ErrorAction Stop — New-Item creates a file or folder; -ItemType is a command option or flag; its exact behavior is defined beside the command; Directory is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; -Path is a command option or flag; its exact behavior is defined beside the command; ".\github" is a path, relative location, branch-style name, or file argument; verify every character before running it; -ErrorAction is a command option or flag; its exact behavior is defined beside the command; Stop is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation

### Does it change anything?

This can change files, Git state, packages, database objects, or data.

### Is it safe to rerun?

Safe to rerun only after reading the idempotency note and confirming that the same batch, file, or object will not be duplicated.

### What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

### Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

### What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

### How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use Get-Location or Test-Path; for Git, use git status and git branch --show-current; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

**Do not continue unless:**

The result is visible, understandable, and recorded as RUN BY USER or VERIFIED BY USER. Displaying this workbook does not count as execution.

**Common mistake:**

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

**Exact recovery:**

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

**What you just accomplished:**

You executed and checked one controlled operation rather than treating a long script as a black box.

**How this connects to the project:**

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 19 lesson index](#)

**Folder-creation decision branches****If the folder is created**

Run `Test-Path -LiteralPath ".\github" -PathType Container` and require True.

**If PowerShell says the folder already exists**

Do not delete or recreate it. Run `Get-ChildItem -LiteralPath ".\github" -Force`, inspect its existing files, and preserve them. Continue only when the existing folder is the intended path.

**If the parent path does not exist**

Return to the parent-folder tutorial. Create and verify one parent level at a time; do not create the entire future tree in one command.

**Verify the folder**

1. Run `Test-Path ".\github" -PathType Container`.
2. Require the output True before creating a child file.
3. Remember: Git does not track an empty folder by itself; the folder becomes visible in Git history when a tracked file is added.

**Folder introduction — scripts/**

**Exact folder name:** scripts

**Exact parent:** repository root

**Why it is needed now:** Phase 19 is about to place its first responsibility-specific file here; creating it earlier would have produced an unexplained empty structure.

**What will eventually be inside:** Only files whose purpose matches this folder's name.

**Why another folder is not appropriate:** Separation keeps source SQL, transformations, tests, configuration, documentation, and generated artifacts reviewable.

**Naming rules:** Preserve lowercase/uppercase exactly as shown. Hyphens, underscores, spaces, and plural forms create different paths. This project avoids spaces in technical folder names.

**VS Code method**

1. CLICK: Open Explorer in VS Code.
2. LOOK FOR: Confirm the repository root is the top folder.
3. Expand the parent path repository root one level at a time.
4. RIGHT-CLICK: Right-click the immediate parent folder.
5. CLICK: **New Folder**.
6. TYPE THIS: scripts.
7. PRESS: Enter.
8. LOOK FOR: The folder appears once, at the correct indentation level.

**PowerShell method**

## Action 19.D2.1 — Create the folder scripts

### Application:

Windows PowerShell or the VS Code PowerShell terminal

### Window or panel:

VS Code integrated PowerShell terminal at the repository root

### Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

### Current folder or location:

The repository root C:\Users\User\Desktop\Northstar\_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username.

### What you are about to do:

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

### Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

### Exact physical actions:

1. CLICK: Bring **Windows PowerShell or the VS Code PowerShell terminal** to the front.
2. LOOK FOR: Confirm the current location matches The repository root C:\Users\User\Desktop\Northstar\_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

### Command or code (PowerShell):

```
New-Item -ItemType Directory -Path ".\scripts" -ErrorAction Stop
```

### Where to enter it:

VS Code integrated PowerShell terminal at the repository root. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

### Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

### What each part means:

- **Line 1:** `New-Item -ItemType Directory -Path ".\scripts" -ErrorAction Stop` — `New-Item` creates a file or folder; `-ItemType` is a command option or flag; its exact behavior is defined beside the command; `Directory` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `-Path` is a command option or flag; its exact behavior is defined beside the command; `".\scripts"` is a path, relative location, branch-style name, or file argument; verify every character before running it; `-ErrorAction` is a command option or flag; its exact behavior is defined beside the command; `Stop` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation

### Does it change anything?

This can change files, Git state, packages, database objects, or data.

### Is it safe to rerun?

Safe to rerun only after reading the idempotency note and confirming that the same batch, file, or object will not be duplicated.

**What should happen:**

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

**Expected example:**

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

**What may look different:**

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

**How to verify success:**

Run or perform the smallest independent check named in the lesson. For a path, use Get-Location or Test-Path; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

**Do not continue unless:**

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

**Common mistake:**

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

**Exact recovery:**

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

**What you just accomplished:**

You executed and checked one controlled operation rather than treating a long script as a black box.

**How this connects to the project:**

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 19 lesson index](#)

**Folder-creation decision branches****If the folder is created**

Run `Test-Path -LiteralPath ".\scripts" -PathType Container` and require `True`.

**If PowerShell says the folder already exists**

Do not delete or recreate it. Run `Get-ChildItem -LiteralPath ".\scripts" -Force`, inspect its existing files, and preserve them. Continue only when the existing folder is the intended path.

**If the parent path does not exist**

Return to the parent-folder tutorial. Create and verify one parent level at a time; do not create the entire future tree in one command.

**Verify the folder**

1. Run `Test-Path ".\scripts" -PathType Container`.
2. Require the output `True` before creating a child file.
3. Remember: Git does not track an empty folder by itself; the folder becomes visible in Git history when a tracked file is added.

**Folder introduction — tests/**

**Exact folder name:** `tests`

**Exact parent:** repository root

**Why it is needed now:** Phase 19 is about to place its first responsibility-specific file here; creating it earlier would have produced an unexplained empty structure.

**What will eventually be inside:** Only files whose purpose matches this folder's name.

**Why another folder is not appropriate:** Separation keeps source SQL, transformations, tests, configuration, documentation, and generated artifacts reviewable.

**Naming rules:** Preserve lowercase/uppercase exactly as shown. Hyphens, underscores, spaces, and plural forms create different paths. This project avoids spaces in technical folder names.

### VS Code method

1. CLICK: Open Explorer in VS Code.
2. LOOK FOR: Confirm the repository root is the top folder.
3. Expand the parent path repository root one level at a time.
4. RIGHT-CLICK: Right-click the immediate parent folder.
5. CLICK: **New Folder**.
6. TYPE THIS: tests.
7. PRESS: Enter.
8. LOOK FOR: The folder appears once, at the correct indentation level.

### PowerShell method

## Action 19.D3.1 — Create the folder tests

---

#### Application:

Windows PowerShell or the VS Code PowerShell terminal

#### Window or panel:

VS Code integrated PowerShell terminal at the repository root

#### Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

#### Current folder or location:

The repository root C:\Users\User\Desktop\Northstar\_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username.

#### What you are about to do:

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

#### Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

#### Exact physical actions:

1. CLICK: Bring **Windows PowerShell or the VS Code PowerShell terminal** to the front.
2. LOOK FOR: Confirm the current location matches The repository root C:\Users\User\Desktop\Northstar\_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

#### Command or code (PowerShell):

```
New-Item -ItemType Directory -Path ".\tests" -ErrorAction Stop
```

#### Where to enter it:

VS Code integrated PowerShell terminal at the repository root. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

#### Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

## What each part means:

- **Line 1:** `New-Item -ItemType Directory -Path ".\tests" -ErrorAction Stop` — `New-Item` creates a file or folder; `-ItemType` is a command option or flag; its exact behavior is defined beside the command; `Directory` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `-Path` is a command option or flag; its exact behavior is defined beside the command; `".\tests"` is a path, relative location, branch-style name, or file argument; verify every character before running it; `-ErrorAction` is a command option or flag; its exact behavior is defined beside the command; `Stop` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation

## Does it change anything?

This can change files, Git state, packages, database objects, or data.

## Is it safe to rerun?

Safe to rerun only after reading the idempotency note and confirming that the same batch, file, or object will not be duplicated.

## What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

## Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

## What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

1. Run `Test-Path ".\tests\integration" -PathType Container`.
2. Require the output `True` before creating a child file.
3. Remember: Git does not track an empty folder by itself; the folder becomes visible in Git history when a tracked file is added.

## File introduction — .github/workflows/validate\_project.yml

**Exact filename:** validate\_project.yml

**Filename extension:** .yml. In this project it identifies human-readable configuration and helps the correct application choose syntax highlighting or execution behavior.

**Exact parent folder:** .github/workflows relative to the repository root.

**Why this file belongs there:** Files with the same responsibility are grouped so a reviewer can find configuration, source SQL, transformations, tests, documentation, and report assets without guessing.

**What the file will contain:** human-readable configuration for Phase 19.

**Later dependencies:** Later phase commands, tests, GitHub Actions, Databricks tasks, warehouse loads, Power BI work, or portfolio evidence may depend on its exact path.

**Should Git track it?** Yes, unless the lesson explicitly identifies it as generated data, a local secret, a log, or a machine-specific artifact.

**Could it contain secrets?** It should not contain live passwords, tokens, connection strings, or account identifiers.

**What happens if it is missing:** The corresponding phase cannot be reproduced, validated, or explained from the repository alone.

### VS Code click path

1. CLICK: In VS Code, open **Explorer** from the left Activity Bar.
2. LOOK FOR: Confirm the top-level folder name is SQL-Data-Warehouse-Project and the status bar shows the intended Git branch.
3. CLICK: Expand each parent folder in .github/workflows one level at a time.
4. If a parent folder does not exist, use the folder tutorial in this phase before creating the file.
5. RIGHT-CLICK: Right-click the immediate parent folder.
6. CLICK: Select **New File**.
7. TYPE THIS: validate\_project.yml.
8. PRESS: Enter.
9. LOOK FOR: A new editor tab labeled validate\_project.yml and an empty file under the correct parent folder.
10. PRESS: Ctrl+S after adding each explained section.

### PowerShell path

## Action 19.F1.1 — Create the file .github/workflows/validate\_project.yml from PowerShell

---

### Application:

Windows PowerShell or the VS Code PowerShell terminal

### Window or panel:

VS Code integrated PowerShell terminal opened at the repository root

### Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

### Current folder or location:

The repository root C:\Users\User\Desktop\Northstar\_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username.

### What you are about to do:

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

### Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

### Exact physical actions:

1. CLICK: Bring **Windows PowerShell or the VS Code PowerShell terminal** to the front.
2. LOOK FOR: Confirm the current location matches The repository root C:\Users\User\Desktop\Northstar\_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.

4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

### Command or code (PowerShell):

```
New-Item -ItemType File -Path ".\github\workflows\validate_project.yml" -ErrorAction Stop
```

### Where to enter it:

VS Code integrated PowerShell terminal opened at the repository root. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

### Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

### What each part means:

- **Line 1:** `New-Item -ItemType File -Path ".\github\workflows\validate_project.yml" -ErrorAction Stop` — `New-Item` creates a file or folder; `-ItemType` is a command option or flag; its exact behavior is defined beside the command; `File` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `-Path` is a command option or flag; its exact behavior is defined beside the command; `.\github\workflows\validate_project.yml` is a path, relative location, branch-style name, or file argument; verify every character before running it; `-ErrorAction` is a command option or flag; its exact behavior is defined beside the command; `Stop` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation

### Does it change anything?

This can change files, Git state, packages, database objects, or data.

### Is it safe to rerun?

Safe to rerun only after reading the idempotency note and confirming that the same batch, file, or object will not be duplicated.

### What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

### Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

### What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

### How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

### Do not continue unless:

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

### Common mistake:

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

### Exact recovery:

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

## What you just accomplished:

You executed and checked one controlled operation rather than treating a long script as a black box.

## How this connects to the project:

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 19 lesson index](#)

## File-creation decision branches

### If the command creates the file

Run `Test-Path -LiteralPath ".\github\workflows\validate_project.yml" -PathType Leaf`. Continue only when it returns True and the file is empty because you just created it.

### If PowerShell says the file already exists

Do not add `-Force`, do not clear the file, and do not overwrite it. Open the existing file in VS Code, run `git status --short -- ".github/workflows/validate_project.yml"`, inspect its contents and Git history, and decide whether this lesson should edit the preserved file rather than create a new one.

### If PowerShell says part of the path does not exist

Stop. Create only the missing parent folder through the earlier folder tutorial, verify it with `Test-Path -PathType Container`, and rerun this one file command.

## File-content construction

1. Start with the smallest header, comment, or first section shown in the phase lesson.
2. Read the purpose before typing the section.
3. Add one logical section at a time.
4. Save with `Ctrl+S`.
5. Run the syntax or content validation named in the phase.
6. Correct the first error before adding another section.
7. Use `TODO(USER)` where the workbook requires your own decision or verified value.

## File verification

1. In the VS Code Explorer, confirm the file appears under `.github/workflows`.
2. Right-click the editor tab and choose **Copy Path**; compare the ending with `.github/workflows/validate_project.yml`.
3. In PowerShell at the repository root, run `Test-Path ".github\workflows\validate_project.yml"` and require True.
4. Run `git status --short -- ".github/workflows/validate_project.yml"` to see only this file's Git state.
5. Run the phase-specific validator before committing.

## Optional reference answer for `.github/workflows/validate_project.yml`

Attempt the file construction first. This reference is learning material, not evidence that you created or ran the file.

**Language:** YAML

**Exact file:** `.github/workflows/validate_project.yml`

**Purpose:** human-readable configuration.

**Inputs:** The requirements, configuration, source data, or upstream objects described in Phase 19.

**Expected outputs:** The file's declared objects, logs, tables, checks, or documentation when the user later runs or reads it.

[Back to the Phase 19 lesson index](#)

## File introduction — pyproject.toml

**Exact filename:** pyproject.toml

**Filename extension:** .toml. In this project it identifies project text or configuration and helps the correct application choose syntax highlighting or execution behavior.

**Exact parent folder:** . relative to the repository root.

**Why this file belongs there:** Files with the same responsibility are grouped so a reviewer can find configuration, source SQL, transformations, tests, documentation, and report assets without guessing.

**What the file will contain:** project text or configuration for Phase 19.

**Later dependencies:** Later phase commands, tests, GitHub Actions, Databricks tasks, warehouse loads, Power BI work, or portfolio evidence may depend on its exact path.

**Should Git track it?** Yes, unless the lesson explicitly identifies it as generated data, a local secret, a log, or a machine-specific artifact.

**Could it contain secrets?** It should not contain live passwords, tokens, connection strings, or account identifiers.

**What happens if it is missing:** The corresponding phase cannot be reproduced, validated, or explained from the repository alone.

### VS Code click path

1. CLICK: In VS Code, open **Explorer** from the left Activity Bar.
2. LOOK FOR: Confirm the top-level folder name is SQL-Data-Warehouse-Project and the status bar shows the intended Git branch.
3. CLICK: Expand each parent folder in . one level at a time.
4. If a parent folder does not exist, use the folder tutorial in this phase before creating the file.
5. RIGHT-CLICK: Right-click the immediate parent folder.
6. CLICK: Select **New File**.
7. TYPE THIS: pyproject.toml.
8. PRESS: Enter.
9. LOOK FOR: A new editor tab labeled pyproject.toml and an empty file under the correct parent folder.
10. PRESS: Ctrl+S after adding each explained section.

### PowerShell path

## Action 19.F2.1 — Create the file pyproject.toml from PowerShell

---

### Application:

Windows PowerShell or the VS Code PowerShell terminal

### Window or panel:

VS Code integrated PowerShell terminal opened at the repository root

### Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

### Current folder or location:

The repository root C:\Users\User\Desktop\Northstar\_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username.

### What you are about to do:

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

### Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

### Exact physical actions:

1. CLICK: Bring **Windows PowerShell or the VS Code PowerShell terminal** to the front.
2. LOOK FOR: Confirm the current location matches The repository root C:\Users\User\Desktop\Northstar\_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.

5. **PRESS:** Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. **LOOK FOR:** Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. **DO NOT CONTINUE UNTIL:** Compare the result with the expected shape and complete the verification action.

#### Command or code (PowerShell):

```
New-Item -ItemType File -Path ".\pyproject.toml" -ErrorAction Stop
```

#### Where to enter it:

VS Code integrated PowerShell terminal opened at the repository root. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

#### Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

#### What each part means:

- **Line 1:** `New-Item -ItemType File -Path ".\pyproject.toml" -ErrorAction Stop` — `New-Item` creates a file or folder; `-ItemType` is a command option or flag; its exact behavior is defined beside the command; `File` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `-Path` is a command option or flag; its exact behavior is defined beside the command; `".\pyproject.toml"` is a path, relative location, branch-style name, or file argument; verify every character before running it; `-ErrorAction` is a command option or flag; its exact behavior is defined beside the command; `Stop` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation

#### Does it change anything?

This can change files, Git state, packages, database objects, or data.

#### Is it safe to rerun?

Safe to rerun only after reading the idempotency note and confirming that the same batch, file, or object will not be duplicated.

#### What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

#### Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

#### What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

#### How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

#### Do not continue unless:

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

#### Common mistake:

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

#### Exact recovery:

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

#### What you just accomplished:

You executed and checked one controlled operation rather than treating a long script as a black box.

## How this connects to the project:

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 19 lesson index](#)

## File-creation decision branches

### If the command creates the file

Run `Test-Path -LiteralPath ".\pyproject.toml" -PathType Leaf`. Continue only when it returns True and the file is empty because you just created it.

### If PowerShell says the file already exists

Do not add `-Force`, do not clear the file, and do not overwrite it. Open the existing file in VS Code, run `git status --short -- "pyproject.toml"`, inspect its contents and Git history, and decide whether this lesson should edit the preserved file rather than create a new one.

### If PowerShell says part of the path does not exist

Stop. Create only the missing parent folder through the earlier folder tutorial, verify it with `Test-Path -PathType Container`, and rerun this one file command.

## File-content construction

1. Start with the smallest header, comment, or first section shown in the phase lesson.
2. Read the purpose before typing the section.
3. Add one logical section at a time.
4. Save with `Ctrl+S`.
5. Run the syntax or content validation named in the phase.
6. Correct the first error before adding another section.
7. Use `TODO(USER)` where the workbook requires your own decision or verified value.

## File verification

1. In the VS Code Explorer, confirm the file appears under `..`.
2. Right-click the editor tab and choose **Copy Path**; compare the ending with `pyproject.toml`.
3. In PowerShell at the repository root, run `Test-Path ".\pyproject.toml"` and require True.
4. Run `git status --short -- "pyproject.toml"` to see only this file's Git state.
5. Run the phase-specific validator before committing.

## Optional reference answer for `pyproject.toml`

Attempt the file construction first. This reference is learning material, not evidence that you created or ran the file.

**Language:** TOML

**Exact file:** `pyproject.toml`

**Purpose:** project text or configuration.

**Inputs:** The requirements, configuration, source data, or upstream objects described in Phase 19.

**Expected outputs:** The file's declared objects, logs, tables, checks, or documentation when the user later runs or reads it.

```

[Back to the Phase 19 lesson index](#)

## File introduction — scripts/validation/check\_required\_files.py

**Exact filename:** check\_required\_files.py

**Filename extension:** .py. In this project it identifies executable Python logic and helps the correct application choose syntax highlighting or execution behavior.

**Exact parent folder:** scripts/validation relative to the repository root.

**Why this file belongs there:** Files with the same responsibility are grouped so a reviewer can find configuration, source SQL, transformations, tests, documentation, and report assets without guessing.

**What the file will contain:** executable Python logic for Phase 19.

**Later dependencies:** Later phase commands, tests, GitHub Actions, Databricks tasks, warehouse loads, Power BI work, or portfolio evidence may depend on its exact path.

**Should Git track it?** Yes, unless the lesson explicitly identifies it as generated data, a local secret, a log, or a machine-specific artifact.

**Could it contain secrets?** It should not contain live passwords, tokens, connection strings, or account identifiers.

**What happens if it is missing:** The corresponding phase cannot be reproduced, validated, or explained from the repository alone.

### VS Code click path

1. CLICK: In VS Code, open **Explorer** from the left Activity Bar.
2. LOOK FOR: Confirm the top-level folder name is SQL-Data-Warehouse-Project and the status bar shows the intended Git branch.
3. CLICK: Expand each parent folder in scripts/validation one level at a time.
4. If a parent folder does not exist, use the folder tutorial in this phase before creating the file.
5. RIGHT-CLICK: Right-click the immediate parent folder.
6. CLICK: Select **New File**.
7. TYPE THIS: check\_required\_files.py.
8. PRESS: Enter.
9. LOOK FOR: A new editor tab labeled check\_required\_files.py and an empty file under the correct parent folder.
10. PRESS: Ctrl+S after adding each explained section.

### PowerShell path

## Action 19.F3.1 — Create the file scripts/validation/check\_required\_files.py from PowerShell

### Application:

Windows PowerShell or the VS Code PowerShell terminal

### Window or panel:

VS Code integrated PowerShell terminal opened at the repository root

### Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

### Current folder or location:

The repository root C:\Users\User\Desktop\Northstar\_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username.

### What you are about to do:

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

### Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

### Exact physical actions:

1. CLICK: Bring **Windows PowerShell or the VS Code PowerShell terminal** to the front.
2. LOOK FOR: Confirm the current location matches The repository root C:\Users\User\Desktop\Northstar\_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

### Command or code (PowerShell):

```
New-Item -ItemType File -Path ".\scripts\validation\check_required_files.py" -ErrorAction Stop
```

### Where to enter it:

VS Code integrated PowerShell terminal opened at the repository root. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

### Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

### What each part means:

- **Line 1:** `New-Item -ItemType File -Path ".\scripts\validation\check_required_files.py" -ErrorAction Stop` — `New-Item` creates a file or folder; `-ItemType` is a command option or flag; its exact behavior is defined beside the command; `File` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `-Path` is a command option or flag; its exact behavior is defined beside the command; `".\scripts\validation\check_required_files.py"` is a path, relative location, branch-style name, or file argument; verify every character before running it; `-ErrorAction` is a command option or flag; its exact behavior is defined beside the command; `Stop` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation

### Does it change anything?

This can change files, Git state, packages, database objects, or data.

### Is it safe to rerun?

Safe to rerun only after reading the idempotency note and confirming that the same batch, file, or object will not be duplicated.

### What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

### Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

### What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

### How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

**Do not continue unless:**

The result is visible, understandable, and recorded as RUN BY USER or VERIFIED BY USER. Displaying this workbook does not count as execution.

**Common mistake:**

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

**Exact recovery:**

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

**What you just accomplished:**

You executed and checked one controlled operation rather than treating a long script as a black box.

**How this connects to the project:**

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 19 lesson index](#)

**File-creation decision branches****If the command creates the file**

Run `Test-Path -LiteralPath ".\scripts\validation\check_required_files.py" -PathType Leaf`. Continue only when it returns True and the file is empty because you just created it.

**If PowerShell says the file already exists**

Do not add `-Force`, do not clear the file, and do not overwrite it. Open the existing file in VS Code, run `git status --short -- "scripts/validation/check_required_files.py"`, inspect its contents and Git history, and decide whether this lesson should edit the preserved file rather than create a new one.

**If PowerShell says part of the path does not exist**

Stop. Create only the missing parent folder through the earlier folder tutorial, verify it with `Test-Path -PathType Container`, and rerun this one file command.

**File-content construction**

1. Start with the smallest header, comment, or first section shown in the phase lesson.
2. Read the purpose before typing the section.
3. Add one logical section at a time.
4. Save with Ctrl+S.
5. Run the syntax or content validation named in the phase.
6. Correct the first error before adding another section.
7. Use `TODO(USER)` where the workbook requires your own decision or verified value.

**File verification**

1. In the VS Code Explorer, confirm the file appears under `scripts/validation`.
2. Right-click the editor tab and choose **Copy Path**; compare the ending with `scripts/validation/check_required_files.py`.
3. In PowerShell at the repository root, run `Test-Path ".\scripts\validation\check_required_files.py"` and require True.
4. Run `git status --short -- "scripts/validation/check_required_files.py"` to see only this file's Git state.
5. Run the phase-specific validator before committing.

**Optional reference answer for `scripts/validation/check_required_files.py`**

Attempt the file construction first. This reference is learning material, not evidence that you created or ran the file.

**Language:** Python

**Exact file:** `scripts/validation/check_required_files.py`

**Purpose:** executable Python logic.

**Inputs:** The requirements, configuration, source data, or upstream objects described in Phase 19.

**Expected outputs:** The file's declared objects, logs, tables, checks, or documentation when the user later runs or reads it.

[Back to the Phase 19 lesson index](#)

## File introduction — scripts/validation/validate\_markdown\_links.py

**Exact filename:** validate\_markdown\_links.py

**Filename extension:** .py. In this project it identifies executable Python logic and helps the correct application choose syntax highlighting or execution behavior.

**Exact parent folder:** scripts/validation relative to the repository root.

**Why this file belongs there:** Files with the same responsibility are grouped so a reviewer can find configuration, source SQL, transformations, tests, documentation, and report assets without guessing.

**What the file will contain:** executable Python logic for Phase 19.

**Later dependencies:** Later phase commands, tests, GitHub Actions, Databricks tasks, warehouse loads, Power BI work, or portfolio evidence may depend on its exact path.

**Should Git track it?** Yes, unless the lesson explicitly identifies it as generated data, a local secret, a log, or a machine-specific artifact.

**Could it contain secrets?** It should not contain live passwords, tokens, connection strings, or account identifiers.

**What happens if it is missing:** The corresponding phase cannot be reproduced, validated, or explained from the repository alone.

### VS Code click path

1. CLICK: In VS Code, open **Explorer** from the left Activity Bar.
2. LOOK FOR: Confirm the top-level folder name is SQL-Data-Warehouse-Project and the status bar shows the intended Git branch.
3. CLICK: Expand each parent folder in scripts/validation one level at a time.
4. If a parent folder does not exist, use the folder tutorial in this phase before creating the file.
5. RIGHT-CLICK: Right-click the immediate parent folder.
6. CLICK: Select **New File**.
7. TYPE THIS: validate\_markdown\_links.py.
8. PRESS: Enter.
9. LOOK FOR: A new editor tab labeled validate\_markdown\_links.py and an empty file under the correct parent folder.
10. PRESS: Ctrl+S after adding each explained section.

### PowerShell path

## Action 19.F4.1 — Create the file scripts/validation/validate\_markdown\_links.py from PowerShell

### Application:

Windows PowerShell or the VS Code PowerShell terminal

### Window or panel:

VS Code integrated PowerShell terminal opened at the repository root

**Starting condition:**

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

**Current folder or location:**

The repository root C:\Users\User\Desktop\Northstar\_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username.

**What you are about to do:**

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

**Why this action comes now:**

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

**Exact physical actions:**

1. CLICK: Bring **Windows PowerShell or the VS Code PowerShell terminal** to the front.
2. LOOK FOR: Confirm the current location matches The repository root C:\Users\User\Desktop\Northstar\_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

**Command or code (PowerShell):**

```
New-Item -ItemType File -Path ".\scripts\validation\validate_markdown_links.py" -ErrorAction Stop
```

**Where to enter it:**

VS Code integrated PowerShell terminal opened at the repository root. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

**Plain-English translation:**

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

**What each part means:**

- **Line 1:** New-Item -ItemType File -Path ".\scripts\validation\validate\_markdown\_links.py" -ErrorAction Stop — New-Item creates a file or folder; -ItemType is a command option or flag; its exact behavior is defined beside the command; File is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; -Path is a command option or flag; its exact behavior is defined beside the command; ".\scripts\validation\validate\_markdown\_links.py" is a path, relative location, branch-style name, or file argument; verify every character before running it; -ErrorAction is a command option or flag; its exact behavior is defined beside the command; Stop is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation

**Does it change anything?**

This can change files, Git state, packages, database objects, or data.

**Is it safe to rerun?**

Safe to rerun only after reading the idempotency note and confirming that the same batch, file, or object will not be duplicated.

**What should happen:**

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

**Expected example:**

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

**What may look different:**

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

**How to verify success:**

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

**Do not continue unless:**

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

**Common mistake:**

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

**Exact recovery:**

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

**What you just accomplished:**

You executed and checked one controlled operation rather than treating a long script as a black box.

**How this connects to the project:**

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 19 lesson index](#)

**File-creation decision branches****If the command creates the file**

Run `Test-Path -LiteralPath ".\scripts\validation\validate_markdown_links.py" -PathType Leaf`. Continue only when it returns `True` and the file is empty because you just created it.

**If PowerShell says the file already exists**

Do not add `-Force`, do not clear the file, and do not overwrite it. Open the existing file in VS Code, run `git status --short -- "scripts/validation/validate_markdown_links.py"`, inspect its contents and Git history, and decide whether this lesson should edit the preserved file rather than create a new one.

**If PowerShell says part of the path does not exist**

Stop. Create only the missing parent folder through the earlier folder tutorial, verify it with `Test-Path -PathType Container`, and rerun this one file command.

**File-content construction**

1. Start with the smallest header, comment, or first section shown in the phase lesson.
2. Read the purpose before typing the section.
3. Add one logical section at a time.
4. Save with `Ctrl+S`.
5. Run the syntax or content validation named in the phase.
6. Correct the first error before adding another section.
7. Use `TODO(USER)` where the workbook requires your own decision or verified value.

**File verification**

1. In the VS Code Explorer, confirm the file appears under `scripts/validation`.
2. Right-click the editor tab and choose **Copy Path**; compare the ending with `scripts/validation/validate_markdown_links.py`.
3. In PowerShell at the repository root, run `Test-Path ".\scripts\validation\validate_markdown_links.py"` and require `True`.
4. Run `git status --short -- "scripts/validation/validate_markdown_links.py"` to see only this file's Git state.
5. Run the phase-specific validator before committing.

## Optional reference answer for scripts/validation/validate\_markdown\_links.py

Attempt the file construction first. This reference is learning material, not evidence that you created or ran the file.

**Language:** Python

**Exact file:** scripts/validation/validate\_markdown\_links.py

**Purpose:** executable Python logic.

**Inputs:** The requirements, configuration, source data, or upstream objects described in Phase 19.

**Expected outputs:** The file's declared objects, logs, tables, checks, or documentation when the user later runs or reads it.

```
"""Check repository-relative Markdown links; skip web URLs and anchors."""
from __future__ import annotations

import re
from pathlib import Path
from urllib.parse import unquote

LINK = re.compile(r"(?!)\[[^\]]*\]\\((([^\)]+)\))")

## File introduction — `scripts/validation/validate_notebooks.py`

**Exact filename:** `validate_notebooks.py`

**Filename extension:** `.py`. In this project it identifies executable Python logic and helps the correct application choose syntax highlighting or execution behavior.

**Exact parent folder:** `scripts/validation` relative to the repository root.

**Why this file belongs there:** Files with the same responsibility are grouped so a reviewer can find configuration, source SQL, transformations, tests, documentation, and report assets without guessing.

**What the file will contain:** executable Python logic for Phase 19.

**Later dependencies:** Later phase commands, tests, GitHub Actions, Databricks tasks, warehouse loads, Power BI work, or portfolio evidence may depend on its exact path.

**Should Git track it?** Yes, unless the lesson explicitly identifies it as generated data, a local secret, a log, or a machine-specific artifact.

**Could it contain secrets?** It should not contain live passwords, tokens, connection strings, or account identifiers.

**What happens if it is missing:** The corresponding phase cannot be reproduced, validated, or explained from the repository alone.

## VS Code click path

1. CLICK: In VS Code, open **Explorer** from the left Activity Bar.
2. LOOK FOR: Confirm the top-level folder name is SQL-Data-Warehouse-Project and the status bar shows the intended Git branch.
3. CLICK: Expand each parent folder in scripts/validation one level at a time.
4. If a parent folder does not exist, use the folder tutorial in this phase before creating the file.
5. RIGHT-CLICK: Right-click the immediate parent folder.
6. CLICK: Select **New File**.
7. TYPE THIS: `validate_notebooks.py`.
8. PRESS: Enter.
9. LOOK FOR: A new editor tab labeled `validate_notebooks.py` and an empty file under the correct parent folder.
10. PRESS: Ctrl+S after adding each explained section.

## PowerShell path

### Action 19.F5.1 — Create the file `scripts/validation/validate_notebooks.py` from PowerShell

---

#### Application:

Databricks workspace in a web browser

#### Window or panel:

VS Code integrated PowerShell terminal opened at the repository root

#### Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

#### Current folder or location:

The repository root `C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project`. The User segment is an example; verify your real Windows username.

#### What you are about to do:

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

#### Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

#### Exact physical actions:

1. CLICK: Bring **Databricks workspace in a web browser** to the front.
2. LOOK FOR: Confirm the current location matches The repository root `C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project`. The User segment is an example; verify your real Windows username. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

#### Command or code (PowerShell):

```
New-Item -ItemType File -Path ".\scripts\validation\validate_notebooks.py" -ErrorAction Stop
```

#### Where to enter it:

VS Code integrated PowerShell terminal opened at the repository root. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

#### Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

## What each part means:

- **Line 1:** `New-Item -ItemType File -Path ".\scripts\validation\validate_notebooks.py" -ErrorAction Stop` — `New-Item` creates a file or folder; `-ItemType` is a command option or flag; its exact behavior is defined beside the command; `File` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `-Path` is a command option or flag; its exact behavior is defined beside the command; `".\scripts\validation\validate_notebooks.py"` is a path, relative location, branch-style name, or file argument; verify every character before running it; `-ErrorAction` is a command option or flag; its exact behavior is defined beside the command; `Stop` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation

## Does it change anything?

This can change files, Git state, packages, database objects, or data.

## Is it safe to rerun?

Safe to rerun only after reading the idempotency note and confirming that the same batch, file, or object will not be duplicated.

## What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

## Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

## What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

## How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

## Do not continue unless:

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

## Common mistake:

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

## Exact recovery:

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

## What you just accomplished:

You executed and checked one controlled operation rather than treating a long script as a black box.

## How this connects to the project:

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 19 lesson index](#)

## File-creation decision branches

### If the command creates the file

Run `Test-Path -LiteralPath ".\scripts\validation\validate_notebooks.py" -PathType Leaf`. Continue only when it returns `True` and the file is empty because you just created it.

### If PowerShell says the file already exists

Do not add `-Force`, do not clear the file, and do not overwrite it. Open the existing file in VS Code, run `git status --short -- "scripts/validation/validate_notebooks.py"`, inspect its contents and Git history, and decide whether this lesson should edit the preserved file rather than create a new one.

## If PowerShell says part of the path does not exist

Stop. Create only the missing parent folder through the earlier folder tutorial, verify it with `Test-Path -PathType Container`, and rerun this one file command.

## File-content construction

1. Start with the smallest header, comment, or first section shown in the phase lesson.
2. Read the purpose before typing the section.
3. Add one logical section at a time.
4. Save with Ctrl+S.
5. Run the syntax or content validation named in the phase.
6. Correct the first error before adding another section.
7. Use `TODO(USER)` where the workbook requires your own decision or verified value.

## File verification

1. In the VS Code Explorer, confirm the file appears under `scripts/validation`.
2. Right-click the editor tab and choose **Copy Path**; compare the ending with `scripts/validation/validate_notebooks.py`.
3. In PowerShell at the repository root, run `Test-Path ".\scripts\validation\validate_notebooks.py"` and require `True`.
4. Run `git status --short -- "scripts/validation/validate_notebooks.py"` to see only this file's Git state.
5. Run the phase-specific validator before committing.

## Optional reference answer for `scripts/validation/validate_notebooks.py`

Attempt the file construction first. This reference is learning material, not evidence that you created or ran the file.

**Language:** Python

**Exact file:** `scripts/validation/validate_notebooks.py`

**Purpose:** executable Python logic.

**Inputs:** The requirements, configuration, source data, or upstream objects described in Phase 19.

**Expected outputs:** The file's declared objects, logs, tables, checks, or documentation when the user later runs or reads it.

```
"""Validate .ipynb JSON and compile Git-friendly Databricks source notebooks."""
from __future__ import annotations

[Back to the Phase 19 lesson index](#)

## File introduction — `scripts/validation/validate_sql_dialects.py`

**Exact filename:** `validate_sql_dialects.py`

**Filename extension:** `.py`. In this project it identifies executable Python logic and helps the correct application choose syntax highlighting or execution behavior.

**Exact parent folder:** `scripts/validation` relative to the repository root.

**Why this file belongs there:** Files with the same responsibility are grouped so a reviewer can find configuration, source SQL, transformations, tests, documentation, and report assets without guessing.

**What the file will contain:** executable Python logic for Phase 19.

**Later dependencies:** Later phase commands, tests, GitHub Actions, Databricks tasks, warehouse loads, Power BI work, or portfolio evidence may depend on its exact path.

**Should Git track it?** Yes, unless the lesson explicitly identifies it as generated data, a local secret, a log, or a machine-specific artifact.

**Could it contain secrets?** It should not contain live passwords, tokens, connection strings, or account identifiers.

**What happens if it is missing:** The corresponding phase cannot be reproduced, validated, or explained from the repository alone.

## VS Code click path

1. CLICK: In VS Code, open **Explorer** from the left Activity Bar.
2. LOOK FOR: Confirm the top-level folder name is SQL-Data-Warehouse-Project and the status bar shows the intended Git branch.
3. CLICK: Expand each parent folder in scripts/validation one level at a time.
4. If a parent folder does not exist, use the folder tutorial in this phase before creating the file.
5. RIGHT-CLICK: Right-click the immediate parent folder.
6. CLICK: Select **New File**.
7. TYPE THIS: validate\_sql\_dialects.py.
8. PRESS: Enter.
9. LOOK FOR: A new editor tab labeled validate\_sql\_dialects.py and an empty file under the correct parent folder.
10. PRESS: Ctrl+S after adding each explained section.

## PowerShell path

### Action 19.F6.1 — Create the file scripts/validation/validate\_sql\_dialects.py from PowerShell

---

#### Application:

Windows PowerShell or the VS Code PowerShell terminal

#### Window or panel:

VS Code integrated PowerShell terminal opened at the repository root

#### Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

#### Current folder or location:

The repository root C:\Users\User\Desktop\Northstar\_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username.

#### What you are about to do:

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

#### Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

#### Exact physical actions:

1. CLICK: Bring **Windows PowerShell or the VS Code PowerShell terminal** to the front.
2. LOOK FOR: Confirm the current location matches The repository root C:\Users\User\Desktop\Northstar\_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

#### Command or code (PowerShell):

```
New-Item -ItemType File -Path ".\scripts\validation\validate_sql_dialects.py" -ErrorAction Stop
```

#### Where to enter it:

VS Code integrated PowerShell terminal opened at the repository root. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

#### Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

## What each part means:

- **Line 1:** `New-Item -ItemType File -Path ".\scripts\validation\validate_sql_dialects.py" -ErrorAction Stop` — `New-Item` creates a file or folder; `-ItemType` is a command option or flag; its exact behavior is defined beside the command; `File` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `-Path` is a command option or flag; its exact behavior is defined beside the command; `".\scripts\validation\validate_sql_dialects.py"` is a path, relative location, branch-style name, or file argument; verify every character before running it; `-ErrorAction` is a command option or flag; its exact behavior is defined beside the command; `Stop` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation

## Does it change anything?

This can change files, Git state, packages, database objects, or data.

## Is it safe to rerun?

Safe to rerun only after reading the idempotency note and confirming that the same batch, file, or object will not be duplicated.

## What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

## Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

## What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

## How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

## Do not continue unless:

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

## Common mistake:

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

## Exact recovery:

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

## What you just accomplished:

You executed and checked one controlled operation rather than treating a long script as a black box.

## How this connects to the project:

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 19 lesson index](#)

## File-creation decision branches

### If the command creates the file

Run `Test-Path -LiteralPath ".\scripts\validation\validate_sql_dialects.py" -PathType Leaf`. Continue only when it returns `True` and the file is empty because you just created it.

### If PowerShell says the file already exists

Do not add `-Force`, do not clear the file, and do not overwrite it. Open the existing file in VS Code, run `git status --short -- "scripts/validation/validate_sql_dialects.py"`, inspect its contents and Git history, and decide whether this lesson should edit the preserved file rather than create a new one.

## If PowerShell says part of the path does not exist

Stop. Create only the missing parent folder through the earlier folder tutorial, verify it with `Test-Path -PathType Container`, and rerun this one file command.

## File-content construction

1. Start with the smallest header, comment, or first section shown in the phase lesson.
2. Read the purpose before typing the section.
3. Add one logical section at a time.
4. Save with `Ctrl+S`.
5. Run the syntax or content validation named in the phase.
6. Correct the first error before adding another section.
7. Use `TODO(USER)` where the workbook requires your own decision or verified value.

## File verification

1. In the VS Code Explorer, confirm the file appears under `scripts/validation`.
2. Right-click the editor tab and choose **Copy Path**; compare the ending with `scripts/validation/validate_sql_dialects.py`.
3. In PowerShell at the repository root, run `Test-Path ".\scripts\validation\validate_sql_dialects.py"` and require `True`.
4. Run `git status --short -- "scripts/validation/validate_sql_dialects.py"` to see only this file's Git state.
5. Run the phase-specific validator before committing.

## Optional reference answer for `scripts/validation/validate_sql_dialects.py`

Attempt the file construction first. This reference is learning material, not evidence that you created or ran the file.

**Language:** Python

**Exact file:** `scripts/validation/validate_sql_dialects.py`

**Purpose:** executable Python logic.

**Inputs:** The requirements, configuration, source data, or upstream objects described in Phase 19.

**Expected outputs:** The file's declared objects, logs, tables, checks, or documentation when the user later runs or reads it.

```
"""Require a dialect declaration near the start of every SQL file."""
from pathlib import Path

ALLOWED = {
 "-- Dialect: SQL Server / T-SQL",
 "-- Dialect: PostgreSQL SQL",
 "-- Dialect: Databricks SQL / Spark SQL",
 "-- Dialect: Portable ANSI-style SQL",
}

def main() -> None:
 failures = []
 for path in Path("sql").rglob("*.sql"):
 first_lines = path.read_text(encoding="utf-8").splitlines()[:5]
 if not any(line.strip() in ALLOWED for line in first_lines):
 failures.append(str(path))
 if failures:
 raise SystemExit("SQL files missing an approved dialect header:\n- " + "\n- ".join(failures))
 print("SQL dialect check passed.")

if __name__ == "__main__": main()
```

## Line-by-line explanation

- **Line 1:** `"""Require a dialect declaration near the start of every SQL file."""` — `"""` is a quoted literal; the quotation marks preserve spaces or mark text; `Require a dialect declaration near the start of every SQL file.` is a quoted literal; the quotation marks preserve spaces or mark text; `"""` is a quoted literal; the quotation marks preserve spaces or mark text

## File introduction — tests/integration/test\_repository\_contract.py

**Exact filename:** test\_repository\_contract.py

**Filename extension:** .py. In this project it identifies executable Python logic and helps the correct application choose syntax highlighting or execution behavior.

**Exact parent folder:** tests/integration relative to the repository root.

**Why this file belongs there:** Files with the same responsibility are grouped so a reviewer can find configuration, source SQL, transformations, tests, documentation, and report assets without guessing.

**What the file will contain:** executable Python logic for Phase 19.

**Later dependencies:** Later phase commands, tests, GitHub Actions, Databricks tasks, warehouse loads, Power BI work, or portfolio evidence may depend on its exact path.

**Should Git track it?** Yes, unless the lesson explicitly identifies it as generated data, a local secret, a log, or a machine-specific artifact.

**Could it contain secrets?** It should not contain live passwords, tokens, connection strings, or account identifiers.

**What happens if it is missing:** The corresponding phase cannot be reproduced, validated, or explained from the repository alone.

## VS Code click path

1. CLICK: In VS Code, open **Explorer** from the left Activity Bar.
2. LOOK FOR: Confirm the top-level folder name is SQL-Data-Warehouse-Project and the status bar shows the intended Git branch.
3. CLICK: Expand each parent folder in tests/integration one level at a time.
4. If a parent folder does not exist, use the folder tutorial in this phase before creating the file.
5. RIGHT-CLICK: Right-click the immediate parent folder.
6. CLICK: Select **New File**.
7. TYPE THIS: test\_repository\_contract.py.
8. PRESS: Enter.
9. LOOK FOR: A new editor tab labeled test\_repository\_contract.py and an empty file under the correct parent folder.
10. PRESS: Ctrl+S after adding each explained section.

## PowerShell path

# Action 19.F7.1 — Create the file tests/integration/test\_repository\_contract.py from PowerShell

---

### Application:

Windows PowerShell or the VS Code PowerShell terminal

### Window or panel:

VS Code integrated PowerShell terminal opened at the repository root

### Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

### Current folder or location:

The repository root C:\Users\User\Desktop\Northstar\_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username.

### What you are about to do:

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

### Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

### Exact physical actions:

1. CLICK: Bring **Windows PowerShell or the VS Code PowerShell terminal** to the front.
2. LOOK FOR: Confirm the current location matches The repository root C:\Users\User\Desktop\Northstar\_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.

7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

### Command or code (PowerShell):

```
New-Item -ItemType File -Path ".\tests\integration\test_repository_contract.py" -ErrorAction Stop
```

### Where to enter it:

VS Code integrated PowerShell terminal opened at the repository root. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

### Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

### What each part means:

- **Line 1:** `New-Item -ItemType File -Path ".\tests\integration\test_repository_contract.py" -ErrorAction Stop`  
— `New-Item` creates a file or folder; `-ItemType` is a command option or flag; its exact behavior is defined beside the command; `File` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `-Path` is a command option or flag; its exact behavior is defined beside the command; `".\tests\integration\test_repository_contract.py"` is a path, relative location, branch-style name, or file argument; verify every character before running it; `-ErrorAction` is a command option or flag; its exact behavior is defined beside the command; `Stop` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation

### Does it change anything?

This can change files, Git state, packages, database objects, or data.

### Is it safe to rerun?

Safe to rerun only after reading the idempotency note and confirming that the same batch, file, or object will not be duplicated.

### What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

### Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

### What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

### How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

### Do not continue unless:

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

### Common mistake:

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

### Exact recovery:

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

### What you just accomplished:

You executed and checked one controlled operation rather than treating a long script as a black box.

## How this connects to the project:

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 19 lesson index](#)

## File-creation decision branches

### If the command creates the file

Run `Test-Path -LiteralPath ".\tests\integration\test_repository_contract.py" -PathType Leaf`. Continue only when it returns True and the file is empty because you just created it.

### If PowerShell says the file already exists

Do not add `-Force`, do not clear the file, and do not overwrite it. Open the existing file in VS Code, run `git status --short -- "tests/integration/test_repository_contract.py"`, inspect its contents and Git history, and decide whether this lesson should edit the preserved file rather than create a new one.

### If PowerShell says part of the path does not exist

Stop. Create only the missing parent folder through the earlier folder tutorial, verify it with `Test-Path -PathType Container`, and rerun this one file command.

## File-content construction

1. Start with the smallest header, comment, or first section shown in the phase lesson.
2. Read the purpose before typing the section.
3. Add one logical section at a time.
4. Save with `Ctrl+S`.
5. Run the syntax or content validation named in the phase.
6. Correct the first error before adding another section.
7. Use `TODO(USER)` where the workbook requires your own decision or verified value.

## File verification

1. In the VS Code Explorer, confirm the file appears under `tests/integration`.
2. Right-click the editor tab and choose **Copy Path**; compare the ending with `tests/integration/test_repository_contract.py`.
3. In PowerShell at the repository root, run `Test-Path ".\tests\integration\test_repository_contract.py"` and require True.
4. Run `git status --short -- "tests/integration/test_repository_contract.py"` to see only this file's Git state.
5. Run the phase-specific validator before committing.

## Optional reference answer for tests/integration/test\_repository\_contract.py

Attempt the file construction first. This reference is learning material, not evidence that you created or ran the file.

**Language:** Python

**Exact file:** `tests/integration/test_repository_contract.py`

**Purpose:** executable Python logic.

**Inputs:** The requirements, configuration, source data, or upstream objects described in Phase 19.

**Expected outputs:** The file's declared objects, logs, tables, checks, or documentation when the user later runs or reads it.

```
from pathlib import Path
import yaml

def test_job_notebook_paths_exist() -> None:
 payload = yaml.safe_load(Path("databricks/jobs/job_definition.example.yml").read_text())
 tasks = payload["resources"]["jobs"]["northstar_retail_daily"]["tasks"]
 jobs_dir = Path("databricks/jobs")
 for task in tasks:
 path = (jobs_dir / task["notebook_task"]["notebook_path"]).resolve()
 assert path.exists(), f"Missing job notebook: {path}"

def test_all_gold_tables_are_in_dictionary() -> None:
 text = Path("docs/data_dictionary.csv").read_text(encoding="utf-8")
 for table in ["dim_date", "dim_customer", "dim_product", "dim_store", "dim_employee", "dim_supplier", "dim_promotion", "dim_channel", "dim_campaign", "fact_sales", "fact_returns", "fact_inventory_snapshot", "fact_shipments", "fact_web_sessions", "fact_marketing_spend"]:
 assert table in text
```

[Back to the Phase 19 lesson index](#)

## What your screen should look like now

---

- Every Phase 19 file you actually created appears under the correct parent folder.
- Your open editor tab matches the file you are validating.
- The Git branch has not changed unexpectedly.
- `git status --short` lists only expected work.
- Reference answers remain reference material; your status fields are not automatically completed.

## Lesson 19.3 completion checklist

---

☐

.github/workflows/validate\_project.yml was created by me, saved, located correctly, and inspected — [STATUS]

☐

pyproject.toml was created by me, saved, located correctly, and inspected — [STATUS]

☐

scripts/validation/check\_required\_files.py was created by me, saved, located correctly, and inspected — [STATUS]

☐

scripts/validation/validate\_markdown\_links.py was created by me, saved, located correctly, and inspected — [STATUS]

☐

scripts/validation/validate\_notebooks.py was created by me, saved, located correctly, and inspected — [STATUS]

☐

scripts/validation/validate\_sql\_dialects.py was created by me, saved, located correctly, and inspected — [STATUS]

☐

tests/integration/test\_repository\_contract.py was created by me, saved, located correctly, and inspected — [STATUS]

## Safe stopping point

---

Save every open file with Ctrl+S. You may close VS Code only after `git status --short` is recorded in your journal. The terminal may be closed when no installer, transaction, Python process, Databricks run, warehouse load, or Power BI refresh is active. Resume at [Lesson 19.4](#) and recheck the root and branch.

## Lesson 19.4 — Build and validate required objects

---

### What your screen should look like before starting

---

The phase files are saved, the correct application and connection are visible, and the upstream input has passed its verification gate. Build one object at a time; do not create many objects and inspect them only at the end.

### Action 19.4.G1 — Inspect the current state without changing it

---

#### Application:

VS Code

#### Window or panel:

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

#### Starting condition:

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

#### Current folder or location:

The repository root C:\Users\User\Desktop\Northstar\_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username.

#### What you are about to do:

Inspect the current state without changing it. This is one bounded construction or inspection task.

**Why this action comes now:**

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

**Exact physical actions:**

1. Record the exact starting folders, branch, versions, connections, settings, counts, or evidence.
2. Inspect the result.
3. Record the actual value.
4. Continue only after verification.

**Command or code:**

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

**Where to enter it:**

VS Code. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

**What each part means:**

1. Record the exact starting folders, branch, versions, connections, settings, counts, or evidence.
2. Inspect the result.
3. Record the actual value.
4. Continue only after verification.

**What should happen:**

A visible file, folder, branch, connection, table, notebook, task, relationship, measure, visual, or verification result should appear exactly where the action predicts.

**Expected example:**

Your exact values may differ. The expected result is the same *type* of object and the same required status, not necessarily the same timestamps, row counts, colors, generated IDs, or screen dimensions.

**What may look different:**

Menu wording can vary by product release or account tier. Use the official-source register and look for the described object rather than guessing from an old screenshot.

**How to verify success:**

Reopen or refresh the relevant panel, locate the named object, and inspect the property or output that proves it exists and is in the intended location.

**Do not continue unless:**

You can point to the visible result and explain what it proves. Mark the action VERIFIED BY USER only after that check.

**Common mistake:**

Combining several clicks or decisions, choosing a similarly named object, or continuing because no error dialog appeared.

**Exact recovery:**

Stop at the current screen. Save a screenshot of the error if useful, hide sensitive values, and compare the selected location with the starting condition. Use Back or Cancel rather than Delete or Overwrite. Correct one mismatch and repeat only this action.

**What you just accomplished:**

You completed one observable piece of the Northstar Retail platform and established a checkpoint that can be audited later.

**How this connects to the project:**

The resulting object, decision, or evidence becomes an input to the next stage in the source-to-consumption chain.

[Back to the Phase 19 lesson index](#)

## Action 19.4.G2 — Create the smallest required object or decision

**Application:**

Visual Studio Code

**Window or panel:**

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

**Starting condition:**

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

**Current folder or location:**

The repository root C:\Users\User\Desktop\Northstar\_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username.

**What you are about to do:**

Create the smallest required object or decision. This is one bounded construction or inspection task.

**Why this action comes now:**

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

**Exact physical actions:**

1. Use the phase file tutorial and one bounded action card.
2. Inspect the result.
3. Record the actual value.
4. Continue only after verification.

**Command or code:**

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

**Where to enter it:**

Visual Studio Code. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

**What each part means:**

1. Use the phase file tutorial and one bounded action card.
2. Inspect the result.
3. Record the actual value.
4. Continue only after verification.

**What should happen:**

A visible file, folder, branch, connection, table, notebook, task, relationship, measure, visual, or verification result should appear exactly where the action predicts.

**Expected example:**

Your exact values may differ. The expected result is the same *type* of object and the same required status, not necessarily the same timestamps, row counts, colors, generated IDs, or screen dimensions.

**What may look different:**

Menu wording can vary by product release or account tier. Use the official-source register and look for the described object rather than guessing from an old screenshot.

**How to verify success:**

Reopen or refresh the relevant panel, locate the named object, and inspect the property or output that proves it exists and is in the intended location.

**Do not continue unless:**

You can point to the visible result and explain what it proves. Mark the action VERIFIED BY USER only after that check.

**Common mistake:**

Combining several clicks or decisions, choosing a similarly named object, or continuing because no error dialog appeared.

**Exact recovery:**

Stop at the current screen. Save a screenshot of the error if useful, hide sensitive values, and compare the selected location with the starting condition. Use Back or Cancel rather than Delete or Overwrite. Correct one mismatch and repeat only this action.

**What you just accomplished:**

You completed one observable piece of the Northstar Retail platform and established a checkpoint that can be audited later.

**How this connects to the project:**

The resulting object, decision, or evidence becomes an input to the next stage in the source-to-consumption chain.

## Action 19.4.G3 — Run the phase-specific verification

---

**Application:**

VS Code

**Window or panel:**

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

**Starting condition:**

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

**Current folder or location:**

The repository root C:\Users\User\Desktop\Northstar\_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username.

**What you are about to do:**

Run the phase-specific verification. This is one bounded construction or inspection task.

**Why this action comes now:**

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

**Exact physical actions:**

1. Compare actual output with the required condition and record differences.
2. Inspect the result.
3. Record the actual value.
4. Continue only after verification.

**Command or code:**

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

**Where to enter it:**

VS Code. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

**What each part means:**

1. Compare actual output with the required condition and record differences.
2. Inspect the result.
3. Record the actual value.
4. Continue only after verification.

**What should happen:**

A visible file, folder, branch, connection, table, notebook, task, relationship, measure, visual, or verification result should appear exactly where the action predicts.

**Expected example:**

Your exact values may differ. The expected result is the same *type* of object and the same required status, not necessarily the same timestamps, row counts, colors, generated IDs, or screen dimensions.

**What may look different:**

Menu wording can vary by product release or account tier. Use the official-source register and look for the described object rather than guessing from an old screenshot.

**How to verify success:**

Reopen or refresh the relevant panel, locate the named object, and inspect the property or output that proves it exists and is in the intended location.

**Do not continue unless:**

You can point to the visible result and explain what it proves. Mark the action VERIFIED BY USER only after that check.

**Common mistake:**

Combining several clicks or decisions, choosing a similarly named object, or continuing because no error dialog appeared.

**Exact recovery:**

Stop at the current screen. Save a screenshot of the error if useful, hide sensitive values, and compare the selected location with the starting condition. Use Back or Cancel rather than Delete or Overwrite. Correct one mismatch and repeat only this action.

**What you just accomplished:**

You completed one observable piece of the Northstar Retail platform and established a checkpoint that can be audited later.

**How this connects to the project:**

The resulting object, decision, or evidence becomes an input to the next stage in the source-to-consumption chain.

[Back to the Phase 19 lesson index](#)

## Action 19.4.G4 — Demonstrate one safe failure or alternate-result branch

---

**Application:**

VS Code

**Window or panel:**

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

**Starting condition:**

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

**Current folder or location:**

The repository root C:\Users\User\Desktop\Northstar\_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username.

**What you are about to do:**

Demonstrate one safe failure or alternate-result branch. This is one bounded construction or inspection task.

**Why this action comes now:**

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

**Exact physical actions:**

1. Use a toy/disposable case and prove recovery without damaging verified work.
2. Inspect the result.
3. Record the actual value.
4. Continue only after verification.

**Command or code:**

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

**Where to enter it:**

VS Code. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

**What each part means:**

1. Use a toy/disposable case and prove recovery without damaging verified work.
2. Inspect the result.
3. Record the actual value.
4. Continue only after verification.

**What should happen:**

A visible file, folder, branch, connection, table, notebook, task, relationship, measure, visual, or verification result should appear exactly where the action predicts.

**Expected example:**

Your exact values may differ. The expected result is the same *type* of object and the same required status, not necessarily the same timestamps, row counts, colors, generated IDs, or screen dimensions.

**What may look different:**

Menu wording can vary by product release or account tier. Use the official-source register and look for the described object rather than guessing from an old screenshot.

**How to verify success:**

Reopen or refresh the relevant panel, locate the named object, and inspect the property or output that proves it exists and is in the intended location.

**Do not continue unless:**

You can point to the visible result and explain what it proves. Mark the action VERIFIED BY USER only after that check.

**Common mistake:**

Combining several clicks or decisions, choosing a similarly named object, or continuing because no error dialog appeared.

**Exact recovery:**

Stop at the current screen. Save a screenshot of the error if useful, hide sensitive values, and compare the selected location with the starting condition. Use Back or Cancel rather than Delete or Overwrite. Correct one mismatch and repeat only this action.

**What you just accomplished:**

You completed one observable piece of the Northstar Retail platform and established a checkpoint that can be audited later.

**How this connects to the project:**

The resulting object, decision, or evidence becomes an input to the next stage in the source-to-consumption chain.

## Action 19.4.G5 — Record evidence and prepare the downstream handoff

---

**Application:**

VS Code

**Window or panel:**

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

**Starting condition:**

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

**Current folder or location:**

The repository root C:\Users\User\Desktop\Northstar\_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username.

**What you are about to do:**

Record evidence and prepare the downstream handoff. This is one bounded construction or inspection task.

**Why this action comes now:**

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

**Exact physical actions:**

1. Save the verified input that the next phase consumes.
2. Inspect the result.
3. Record the actual value.
4. Continue only after verification.

**Command or code:**

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

**Where to enter it:**

VS Code. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

**What each part means:**

1. Save the verified input that the next phase consumes.
2. Inspect the result.
3. Record the actual value.

4. Continue only after verification.

**What should happen:**

A visible file, folder, branch, connection, table, notebook, task, relationship, measure, visual, or verification result should appear exactly where the action predicts.

**Expected example:**

Your exact values may differ. The expected result is the same *type* of object and the same required status, not necessarily the same timestamps, row counts, colors, generated IDs, or screen dimensions.

**What may look different:**

Menu wording can vary by product release or account tier. Use the official-source register and look for the described object rather than guessing from an old screenshot.

**How to verify success:**

Reopen or refresh the relevant panel, locate the named object, and inspect the property or output that proves it exists and is in the intended location.

**Do not continue unless:**

You can point to the visible result and explain what it proves. Mark the action VERIFIED BY USER only after that check.

**Common mistake:**

Combining several clicks or decisions, choosing a similarly named object, or continuing because no error dialog appeared.

**Exact recovery:**

Stop at the current screen. Save a screenshot of the error if useful, hide sensitive values, and compare the selected location with the starting condition. Use Back or Cancel rather than Delete or Overwrite. Correct one mismatch and repeat only this action.

**What you just accomplished:**

You completed one observable piece of the Northstar Retail platform and established a checkpoint that can be audited later.

**How this connects to the project:**

The resulting object, decision, or evidence becomes an input to the next stage in the source-to-consumption chain.

[Back to the Phase 19 lesson index](#)

## What your screen should look like now

- The new Phase 19 objects are visible in their owning application.
- The current branch remains the intended feature branch.
- The current database, catalog, schema, Power BI model, or GitHub run is still identifiable.
- Verification output is visible or recorded; no object is marked complete solely because creation code was displayed.
- Any failed toy demonstration has been repaired or isolated.

## Lesson 19.4 completion checklist

☐

Every required object was built separately — [STATUS]

☐

Every object has a declared responsibility/grain — [STATUS]

☐

Inputs and outputs were inspected — [STATUS]

☐

A rerun or alternate-result branch was tested where applicable — [STATUS]

☐

Counts, keys, measures, relationships, or settings were independently validated — [STATUS]

☐

I can explain one failure and its safest recovery — [STATUS]

## Safe stopping point

---

Stop only after the active command, database transaction, Databricks cell/Job, Python process, warehouse load, or Power BI refresh finishes. Save all files and the Power BI project. Record uncommitted Git changes and exact resume action. Resume at [Lesson 19.5](#).

## Lesson 19.5 — Verify, troubleshoot, commit, teach back, and stop safely

---

### What your screen should look like before starting

---

The Phase 19 outputs are visible, all runs are finished, open files are saved, and you can state the active branch and execution context. Any error you encountered has a recorded message and has not been hidden by deleting evidence.

### Design decision — Infrastructure-free CI

---

#### Question:

What should GitHub Actions validate without database or Databricks credentials?

#### Options considered:

- Run only local repository-contract tests.
- Connect CI to all external services.
- No CI.

#### Beginner path selected:

Run syntax, unit, fixture, secret, notebook, link, and dialect checks that require no external infrastructure.

#### Why this path was selected:

It provides repeatable feedback without storing database or workspace credentials.

#### Tradeoff:

It does not prove live external integrations.

#### What a company might do instead:

A company adds ephemeral environments, integration-test credentials, deployment approvals, and environment protections.

#### How to explain this in an interview:

My CI validates the repository contract safely; live platform execution remains separately evidenced rather than falsely simulated.

### If you see Result A

---

GitHub Actions runs every intended check and finishes green on the pushed commit. Record the exact result, perform the named independent verification, and continue only when the gate is satisfied.

### If you see Result B

---

A workflow does not trigger, YAML is invalid, a test fails, or permissions/actions settings block the run. Treat this as information, not permission to delete or overwrite. Follow the branch-specific diagnostic in the current action, preserve evidence, and continue only after the state is understood.

### If you see an error

---

Read the first meaningful error line, redact secrets, and verify the application, path, branch, server/database, catalog/schema, batch ID, parameters, version/tier, and object name. Run the smallest observational check first. Do not reset Git history, drop data, disable a rule, force-push, or replace the target merely to make the error disappear.

### Phase-specific verification gate

---

☐

Required files/objects exist in the exact location.

☐

I personally created or configured them.

☐

I ran the phase commands in the documented context.

☐

I inspected the output rather than relying on a green icon alone.

☐

Counts, keys, relationships, measures, checksums, statuses, or settings meet the declared contract.

☐

Same-batch/rerun behavior is known where applicable.

☐

A controlled failure or realistic alternate-result branch was tested safely where applicable.

☐

No password, token, or secret appears in tracked files, screenshots, notebook output, terminal history pasted into documentation, or staged changes.

☐

Actual verified result: [ENTER VERIFIED RESULT].

## Point-of-failure troubleshooting record

---

### Exact or representative error message:

[PASTE THE FIRST MEANINGFUL ERROR, WITH SECRETS REDACTED]

### What it means in plain language:

[WRITE YOUR INTERPRETATION]

### Most likely cause:

[WRITE ONE TESTABLE HYPOTHESIS]

### What not to do:

Do not delete data, drop databases, reset Git history, force-push, disable constraints, edit raw evidence, change a quality threshold, or expose credentials merely to make the symptom disappear.

### First diagnostic action:

[ENTER THE SMALLEST OBSERVATIONAL CHECK]

### How to read the diagnostic result:

[RESULT A MEANS... / RESULT B MEANS...]

### Safest fix:

[ENTER THE NARROW FIX]

### Alternative fix when applicable:

[ENTER OR N/A]

### How to verify the fix:

[ENTER THE INDEPENDENT RECHECK]

### How to return to the main tutorial:

Resume at the exact action number that failed; do not skip its verification gate.

## Screenshot checkpoint

---

**Application(s) that should be visible:** VS Code, PowerShell, GitHub repository Actions page, and workflow logs.

**Window/panel:** Show workflow YAML, successful Actions run, and one diagnosed/fixed toy failure.

**Sensitive information to hide:** Passwords, tokens, connection strings, email addresses, cloud account IDs, unnecessary Windows profile details, and any secret revealed by an error.

**Include:** The object name, batch/run ID when relevant, result/status, and enough surrounding UI to prove which application and layer is shown.

**Crop out:** Unrelated desktop windows, notification previews, bookmarks, chat, and empty background.

**Recommended filename:** docs/images/phase19\_build-github-actions-continuous-integration\_verified.png.

**Recommended repository folder:** docs/images/.

**README placement:** The section describing Phase 19's verified result; do not use the image before the result is actually verified.

**What it proves:** The visible state existed under the shown context. It does not prove hidden rows, other batches, every filter combination, or a later run.

[ADD YOUR VERIFIED SCREENSHOT HERE]

## Git checkpoint after the verified Phase 19 changes

---

Do not use `git add` until you understand that it stages every matching change under the current directory, including files you did not intend. Prefer targeted staging after inspecting status and diffs.

### Save open work

1. PRESS: In VS Code, press Ctrl+K, then S if you use **Save All**, or press Ctrl+S in every modified editor.
2. In Power BI, press Ctrl+S and confirm the local file location.
3. Wait for database, Python, Databricks, and refresh operations to finish; Git does not capture uncommitted database/cloud state.

## Action 19.5.G1 — Verify the repository root before Git operations

---

### Application:

Windows PowerShell or the VS Code PowerShell terminal

### Window or panel:

VS Code integrated PowerShell terminal

### Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

### Current folder or location:

The repository root C:\Users\User\Desktop\Northstar\_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username.

### What you are about to do:

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

### Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

### Exact physical actions:

1. CLICK: Bring **Windows PowerShell or the VS Code PowerShell terminal** to the front.
2. LOOK FOR: Confirm the current location matches The repository root C:\Users\User\Desktop\Northstar\_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

### Command or code (PowerShell):

```
git rev-parse --show-toplevel
```

### Where to enter it:

VS Code integrated PowerShell terminal. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

### Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

### What each part means:

- **Line 1:** `git rev-parse --show-toplevel` — `git` calls the Git version-control program; `rev-parse` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `--show` is a command option or flag; its exact behavior is defined beside the command; `-toplevel` is a command option or flag; its exact behavior is defined beside the command

### Does it change anything?

This is intended to inspect or validate state rather than change it.

### Is it safe to rerun?

Normally safe to rerun because it is observational, but still confirm the execution location first.

### What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

### Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

### What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

### How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

### Do not continue unless:

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

### Common mistake:

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

### Exact recovery:

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

### What you just accomplished:

You executed and checked one controlled operation rather than treating a long script as a black box.

### How this connects to the project:

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 19 lesson index](#)

## Action 19.5.G2 — Verify the active Git branch

### Application:

Windows PowerShell or the VS Code PowerShell terminal

### Window or panel:

VS Code integrated PowerShell terminal

### Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

### Current folder or location:

The repository root `C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project`. The User segment is an example; verify your real Windows username.

**What you are about to do:**

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

**Why this action comes now:**

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

**Exact physical actions:**

1. CLICK: Bring **Windows PowerShell or the VS Code PowerShell terminal** to the front.
2. LOOK FOR: Confirm the current location matches The repository root C:\Users\User\Desktop\Northstar\_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

**Command or code (PowerShell):**

```
git branch --show-current
```

**Where to enter it:**

VS Code integrated PowerShell terminal. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

**Plain-English translation:**

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

**What each part means:**

- **Line 1:** `git branch --show-current` — `git` calls the Git version-control program; `branch` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `--show` is a command option or flag; its exact behavior is defined beside the command; `-current` is a command option or flag; its exact behavior is defined beside the command

**Does it change anything?**

This is intended to inspect or validate state rather than change it.

**Is it safe to rerun?**

Normally safe to rerun because it is observational, but still confirm the execution location first.

**What should happen:**

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

**Expected example:**

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

**What may look different:**

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

**How to verify success:**

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

**Do not continue unless:**

The result is visible, understandable, and recorded as RUN BY USER or VERIFIED BY USER. Displaying this workbook does not count as execution.

**Common mistake:**

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

**Exact recovery:**

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

**What you just accomplished:**

You executed and checked one controlled operation rather than treating a long script as a black box.

**How this connects to the project:**

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 19 lesson index](#)

## Action 19.5.G3 — Inspect all current Git changes

---

**Application:**

Windows PowerShell or the VS Code PowerShell terminal

**Window or panel:**

VS Code integrated PowerShell terminal

**Starting condition:**

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

**Current folder or location:**

The repository root C:\Users\User\Desktop\Northstar\_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username.

**What you are about to do:**

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

**Why this action comes now:**

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

**Exact physical actions:**

1. CLICK: Bring **Windows PowerShell or the VS Code PowerShell terminal** to the front.
2. LOOK FOR: Confirm the current location matches The repository root C:\Users\User\Desktop\Northstar\_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

**Command or code (PowerShell):**

```
git status --short
```

**Where to enter it:**

VS Code integrated PowerShell terminal. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

**Plain-English translation:**

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

**What each part means:**

- **Line 1:** `git status --short` — `git` calls the Git version-control program; `status` shows tracked, staged, modified, and untracked work; `--short` is a command option or flag; its exact behavior is defined beside the command

**Does it change anything?**

This is intended to inspect or validate state rather than change it.

**Is it safe to rerun?**

Normally safe to rerun because it is observational, but still confirm the execution location first.

**What should happen:**

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

**Expected example:**

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

**What may look different:**

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

**How to verify success:**

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

**Do not continue unless:**

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

**Common mistake:**

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

**Exact recovery:**

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

**What you just accomplished:**

You executed and checked one controlled operation rather than treating a long script as a black box.

**How this connects to the project:**

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 19 lesson index](#)

**Interpret `git status --short`**

- `??` means untracked: Git sees a new path but it is not staged.
- `M` means modified in the working tree but not staged.
- `M` means the staged version differs from the last commit.
- `MM` means a staged version exists and the file has additional unstaged edits.
- `A` means staged as a new file.
- `D` means deletion; stop and investigate unless deletion is deliberate.
- `R` means rename; inspect both old and new paths.
- A blank result means the working tree is clean. It does not prove database, Databricks, or Power BI work occurred.

## Action 19.5.G4 — Inspect the unstaged diff for .github/workflows/validate\_project.yml

---

### Application:

Windows PowerShell or the VS Code PowerShell terminal

### Window or panel:

VS Code integrated PowerShell terminal

### Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

### Current folder or location:

The repository root C:\Users\User\Desktop\Northstar\_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username.

### What you are about to do:

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

### Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

### Exact physical actions:

1. CLICK: Bring **Windows PowerShell or the VS Code PowerShell terminal** to the front.
2. LOOK FOR: Confirm the current location matches The repository root C:\Users\User\Desktop\Northstar\_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

### Command or code (PowerShell):

```
git diff -- ".github/workflows/validate_project.yml"
```

### Where to enter it:

VS Code integrated PowerShell terminal. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

### Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

### What each part means:

- **Line 1:** `git diff -- ".github/workflows/validate_project.yml"` — `git` calls the Git version-control program; `diff` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `--` is a command option or flag; its exact behavior is defined beside the command; `".github/workflows/validate_project.yml"` is a path, relative location, branch-style name, or file argument; verify every character before running it

### Does it change anything?

This is intended to inspect or validate state rather than change it.

### Is it safe to rerun?

Normally safe to rerun because it is observational, but still confirm the execution location first.

### What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

### Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

### What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

### How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

### Do not continue unless:

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

### What you just accomplished:

You executed and checked one controlled operation rather than treating a long script as a black box.

### How this connects to the project:

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 19 lesson index](#)

## Action 19.5.G5 — Stage only the reviewed file `.github/workflows/validate_project.yml`

### Application:

Windows PowerShell or the VS Code PowerShell terminal

### Window or panel:

VS Code integrated PowerShell terminal

### Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

### Current folder or location:

The repository root `C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project`. The User segment is an example; verify your real Windows username.

### What you are about to do:

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

### Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

### Exact physical actions:

1. CLICK: Bring **Windows PowerShell or the VS Code PowerShell terminal** to the front.
2. LOOK FOR: Confirm the current location matches The repository root `C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project`. The User segment is an example; verify your real Windows username. or the more specific location stated below.

3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

#### Command or code (PowerShell):

```
git add -- ".github/workflows/validate_project.yml"
```

#### Where to enter it:

VS Code integrated PowerShell terminal. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

#### Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

#### What each part means:

- **Line 1:** `git add -- ".github/workflows/validate_project.yml"` — `git` calls the Git version-control program; `add` moves selected changes into the staging area; `--` is a command option or flag; its exact behavior is defined beside the command; `".github/workflows/validate_project.yml"` is a path, relative location, branch-style name, or file argument; verify every character before running it

#### Does it change anything?

This can change files, Git state, packages, database objects, or data.

#### Is it safe to rerun?

Safe to rerun only after reading the idempotency note and confirming that the same batch, file, or object will not be duplicated.

#### What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

#### Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

#### What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

#### How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

#### Do not continue unless:

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

#### Common mistake:

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

#### Exact recovery:

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

**What you just accomplished:**

You executed and checked one controlled operation rather than treating a long script as a black box.

**How this connects to the project:**

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 19 lesson index](#)

For every additional intended path, run a separate targeted `git add -- "path"` after its diff is reviewed. Never stage `.env`, generated raw batches, credentials, tokens, local database files, or an unverified Power BI artifact.

## Action 19.5.G6 — Inspect the staged diff

---

**Application:**

Windows PowerShell or the VS Code PowerShell terminal

**Window or panel:**

VS Code integrated PowerShell terminal

**Starting condition:**

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

**Current folder or location:**

The repository root `C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project`. The User segment is an example; verify your real Windows username.

**What you are about to do:**

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

**Why this action comes now:**

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

**Exact physical actions:**

1. CLICK: Bring **Windows PowerShell or the VS Code PowerShell terminal** to the front.
2. LOOK FOR: Confirm the current location matches The repository root `C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project`. The User segment is an example; verify your real Windows username. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

**Command or code (PowerShell):**

```
git diff --cached
```

**Where to enter it:**

VS Code integrated PowerShell terminal. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

**Plain-English translation:**

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

**What each part means:**

- **Line 1:** `git diff --cached` — `git` calls the Git version-control program; `diff` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `--cached` is a command option or flag; its exact behavior is defined beside the command

**Does it change anything?**

This is intended to inspect or validate state rather than change it.

**Is it safe to rerun?**

Normally safe to rerun because it is observational, but still confirm the execution location first.

**What should happen:**

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

**Expected example:**

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

**What may look different:**

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

**How to verify success:**

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

**Do not continue unless:**

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

**Common mistake:**

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

**Exact recovery:**

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

**What you just accomplished:**

You executed and checked one controlled operation rather than treating a long script as a black box.

**How this connects to the project:**

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 19 lesson index](#)

## Action 19.5.G7 — Create the Phase 19 commit

---

**Application:**

Web browser on GitHub

**Window or panel:**

VS Code integrated PowerShell terminal

**Starting condition:**

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

**Current folder or location:**

The repository root `C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project`. The User segment is an example; verify your real Windows username.

**What you are about to do:**

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

**Why this action comes now:**

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

**Exact physical actions:**

1. CLICK: Bring **Web browser on GitHub** to the front.

2. LOOK FOR: Confirm the current location matches The repository root C:\Users\User\Desktop\Northstar\_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

#### Command or code (PowerShell):

```
git commit -m "ci: validate repository contracts in github actions"
```

#### Where to enter it:

VS Code integrated PowerShell terminal. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

#### Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

#### What each part means:

- **Line 1:** `git commit -m "ci: validate repository contracts in github actions"` — `git` calls the Git version-control program; `commit` records the staged snapshot; `-m` asks Python to run an installed module; `"ci: validate repository contracts in github actions"` is a quoted literal; the quotation marks preserve spaces or mark text

#### Does it change anything?

This can change files, Git state, packages, database objects, or data.

#### Is it safe to rerun?

Safe to rerun only after reading the idempotency note and confirming that the same batch, file, or object will not be duplicated.

#### What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

#### Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

#### What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

#### How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

#### Do not continue unless:

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

#### Common mistake:

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

#### Exact recovery:

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

**What you just accomplished:**

You executed and checked one controlled operation rather than treating a long script as a black box.

**How this connects to the project:**

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 19 lesson index](#)

## Action 19.5.G8 — Verify the new commit

---

**Application:**

Windows PowerShell or the VS Code PowerShell terminal

**Window or panel:**

VS Code integrated PowerShell terminal

**Starting condition:**

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

**Current folder or location:**

The repository root C:\Users\User\Desktop\Northstar\_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username.

**What you are about to do:**

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

**Why this action comes now:**

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

**Exact physical actions:**

1. CLICK: Bring **Windows PowerShell or the VS Code PowerShell terminal** to the front.
2. LOOK FOR: Confirm the current location matches The repository root C:\Users\User\Desktop\Northstar\_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

**Command or code (PowerShell):**

```
git log -1 --oneline --decorate
```

**Where to enter it:**

VS Code integrated PowerShell terminal. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

**Plain-English translation:**

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

**What each part means:**

- **Line 1:** `git log -1 --oneline --decorate` — `git` calls the Git version-control program; `log` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `-1` is a command option or flag; its exact behavior is defined beside the command; `--oneline` is a command option or flag; its exact behavior is defined beside the command; `--decorate` is a command option or flag; its exact behavior is defined beside the command

**Does it change anything?**

This is intended to inspect or validate state rather than change it.

**Is it safe to rerun?**

Normally safe to rerun because it is observational, but still confirm the execution location first.

**What should happen:**

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

**Expected example:**

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

**What may look different:**

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

**How to verify success:**

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

**Do not continue unless:**

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

**Common mistake:**

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

**Exact recovery:**

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

**What you just accomplished:**

You executed and checked one controlled operation rather than treating a long script as a black box.

**How this connects to the project:**

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 19 lesson index](#)

## Action 19.5.G9 — Push the feature branch and set upstream

**Application:**

Windows PowerShell or the VS Code PowerShell terminal

**Window or panel:**

VS Code integrated PowerShell terminal

**Starting condition:**

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

**Current folder or location:**

The repository root `C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project`. The User segment is an example; verify your real Windows username.

**What you are about to do:**

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

**Why this action comes now:**

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

**Exact physical actions:**

1. CLICK: Bring **Windows PowerShell or the VS Code PowerShell terminal** to the front.

2. LOOK FOR: Confirm the current location matches The repository root C:\Users\User\Desktop\Northstar\_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

#### Command or code (PowerShell):

```
git push -u origin "$(git branch --show-current)"
```

#### Where to enter it:

VS Code integrated PowerShell terminal. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

#### Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

#### What each part means:

- **Line 1:** `git push -u origin "$(git branch --show-current)"` — `git` calls the Git version-control program; `push` sends local commits to a remote repository; `-u` is a command option or flag; its exact behavior is defined beside the command; `origin` the conventional name of the GitHub remote; `"$(git branch --show-current)"` is a quoted literal; the quotation marks preserve spaces or mark text

#### Does it change anything?

This can change files, Git state, packages, database objects, or data.

#### Is it safe to rerun?

Safe to rerun only after reading the idempotency note and confirming that the same batch, file, or object will not be duplicated.

#### What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

#### Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

#### What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

#### How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

#### Do not continue unless:

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

#### Common mistake:

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

#### Exact recovery:

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm

the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

### What you just accomplished:

You executed and checked one controlled operation rather than treating a long script as a black box.

### How this connects to the project:

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 19 lesson index](#)

## Verify on GitHub

1. CLICK: Open the repository page in a browser.
2. CLICK: Open the branch selector above the file list.
3. TYPE THIS: The exact branch name returned locally.
4. CLICK: Select that branch.
5. LOOK FOR: The latest commit message `ci: validate repository contracts in github actions` and the intended changed paths.
6. CLICK: Open each changed file and confirm the GitHub version matches the staged diff.
7. Do not merge solely because the push succeeded; CI and review must pass.

## Push-rejected recovery

If Git says the remote contains work you do not have, do not use `--force`. Run `git fetch origin`, inspect `git log --oneline --graph --decorate --all -20`, then rebase or merge only after understanding the divergence. Resolve conflicts one file at a time, run tests again, and push normally. A rejection protects remote work; it is not permission to overwrite it.

## Explain it in your own words

---

Without copying the model answer, explain:

1. What you created or configured in Phase 19.
2. Why it exists.
3. Where it is located on your computer, in a database, in Databricks, in Power BI, or on GitHub.
4. What information enters it.
5. What information leaves it.
6. How it connects to the next phase.
7. How you verified it.
8. What could cause it to fail.
9. Which decision/tradeoff you could defend in an interview.

## My answer

[WRITE YOUR ANSWER BEFORE READING THE REFERENCE]

## OPTIONAL REFERENCE ANSWER — PHASE 19 TEACH-BACK MODEL

---

Read this only after completing **MY TASK** and using the three hints in order. The model is a learning reference, not evidence of your execution.

“Phase 19 created the verified boundary described by **Build GitHub Actions continuous integration**. It consumes only the outputs accepted from earlier phases, produces a named and auditable handoff, and records enough metadata and tests to detect wrong context, missing data, duplicates, failed rules, or unsafe reruns. I verified the result in its owning application and connected the evidence to Git without claiming that displayed instructions were executed.”

## Mini quiz

---

1. Multiple choice: Why does Phase 19 occur at this point in the source-to-consumption chain? A) Because menu order is arbitrary. B) Because its verified upstream input now exists. C) Because later phases do not depend on it. D) To create portfolio screenshots before validation.
2. True or false: A command that displays no error is automatically verified even when it ran in the wrong folder, database, catalog, schema, branch, or filter context.
3. Fill in the blank: The statement that defines what one row represents is the table or entity \_\_\_\_\_.

4. What command would you use first to confirm the PowerShell current folder before a repository command?
  5. Troubleshooting: Your output differs from the example. What should you check before deleting, overwriting, resetting, force-pushing, or weakening a test?
  6. Design choice: Explain one tradeoff of Track A and one production alternative.
  7. Code reading: Why are input, accepted, rejected, and deduplicated counts recorded separately?
  8. Ownership: Which status may you select only after personally performing and inspecting the verification?
- 

## Mini quiz answer key and explanations

---

1. **B.** This phase is ordered after its prerequisites so its output has a trustworthy input. A is wrong because order is intentional; C is wrong because later phases depend on the handoff; D is wrong because screenshots follow verification.
2. **False.** Lack of an error proves only that the application accepted something; context and independent verification still matter.
3. **Grain.** Grain is the precise meaning of one row. A key identifies a row, but it does not by itself state the row's business meaning.
4. **Get-Location.** It shows the shell's current folder. `git rev-parse --show-toplevel` separately verifies the repository root when inside a clone.
5. Check application, folder/path, branch, server/database, catalog/schema, batch ID, parameters, source/target grain, filter context, version/tier differences, and the first meaningful error. Destructive changes are not a diagnostic step.
6. Track A has manual upload/download boundaries and batch latency. A production alternative is routable private connectivity with cloud object storage/managed warehouse, identities, and automated orchestration.
7. Separate counts make every row outcome explainable. A single final count can hide silent drops, duplicates, or records that moved to quarantine.
8. **Verified by me / VERIFIED BY USER.** `PLANNED`, `CREATED BY USER`, and `RUN BY USER` describe earlier states; only inspected evidence supports verification.

## My Phase 19 Learning Journal

### What I learned:

[WRITE YOUR ANSWER]

### What I can now explain without help:

[WRITE YOUR ANSWER]

### What I still need to practice:

[WRITE YOUR ANSWER]

## What your screen should look like now

---

- The phase output and final validation are saved or visible.

- The intended feature branch is still active.
- `git status` is either clean after the commit or lists only deliberately deferred work recorded in the journal.
- The branch exists on GitHub after a successful push.
- No database transaction, Databricks run, loader, test process, or Power BI refresh is still active.
- The next phase's required input is identifiable.

## Lesson 19.5 completion checklist

---

☐

I completed the verification gate with my actual results — [STATUS]

☐

I recorded at least one realistic failure, alternate result, or diagnostic path — [STATUS]

☐

I captured and redacted the required screenshot only after verification — [STATUS]

☐

I reviewed, staged, committed, pushed, and verified only the intended Git changes — [STATUS]

☐

I completed the teach-back, quiz, answer review, and learning journal — [STATUS]

☐

I can name the exact verified handoff to the next phase — [STATUS]

## Safe stopping point

---

All files must be saved. The terminal may be closed after the Git result is recorded. SSMS/pgAdmin may be closed after queries finish and transactions are committed/rolled back. Databricks compute may be stopped when no Job or notebook is running. Power BI may be closed after saving. Resume from the next phase's screen-start checklist and re-verify root, branch, connection, and latest accepted batch.

## How this phase connects to the next phase

---

Phase 20 documents only verified work and links each claim to evidence.

## Phase 19 completion checklist

---

☐

Phase goal explained in my own words — [STATUS]

☐

Required files/objects created by me — [STATUS]

☐

Commands run by me — [STATUS]

☐

Output independently inspected — [STATUS]

☐

Failure/alternate branch understood — [STATUS]

☐

Screenshot captured and redacted — [STATUS]

☐

Targeted Git commit exists — [STATUS]

☐

Branch pushed and verified on GitHub — [STATUS]

☐

Quiz completed before answer key — [STATUS]

☐

Journal completed — [STATUS]

☐

Final phase status manually set — [ ] Not started / [-] In progress / [x] Verified by me / [!] Needs troubleshooting

# Phase 20 — Build the README, evidence package, and portfolio presentation

[Back to the master table of contents](#)

**Track:** Track A required

**Status when first opened:** PLANNED

**Completion rule:** The phase is not complete because its instructions exist. Mark it VERIFIED BY USER only after you perform the work, inspect the output, and save evidence.

## Why this phase happens now

---

**Earlier work this phase depends on:** Verified evidence, screenshots, metrics, and limitations.

**What would go wrong if it happened earlier:** You would create objects without a verified requirement, valid upstream input, protected repository state, or known execution environment.

**Later work that depends on it:** Phase 21 turns the real project into truthful interview explanations.

**Decision being made:** Choose and verify the simplest local-first method that teaches the professional concept without pretending that local services are publicly reachable.

**Alternatives:** A company could use managed cloud databases, infrastructure as code, service principals, direct JDBC publication, deployment bundles, or streaming. Those options are discussed as tradeoffs, not substituted silently.

**Beginner path selected:** Track A: local SQL Server and PostgreSQL, Python batch extracts, manual governed upload to Databricks, Delta Bronze/Silver/Gold, manual verified export, local SQL Server warehouse, and Power BI Import.

**Reason for the order:** Requirements become source decisions; sources become generated data; source data becomes extraction batches; batches become Bronze; Bronze becomes Silver; Silver becomes Gold; Gold becomes warehouse and Power BI input.

## Phase 20 lesson index

---

1. [Lesson 20.1 — Understand the phase and starting screen](#)
2. [Lesson 20.2 — Perform the notebook-guided actions one at a time](#)
3. [Lesson 20.3 — Create and understand the phase files](#)
4. [Lesson 20.4 — Build and validate required objects](#)
5. [Lesson 20.5 — Verify, troubleshoot, commit, teach back, and stop safely](#)

## Lesson 20.1 — Understand the phase and starting screen

---

### What your screen should look like before starting

---

- **Application open:** VS Code Markdown Preview, GitHub repository page, File Explorer, and image editor only for redaction/cropping.
- **Window in front:** The application named by the first action; do not keep an installer, database editor, notebook, and Power BI dialog stacked ambiguously.
- **Repository folder:** C:\Users\User\Desktop\Northstar\_Retail\SQL-Data-Warehouse-Project when repository work is required. Verify User on your computer.
- **Git branch:** A feature branch, not a detached commit. Run `git branch --show-current` and record the exact result.
- **Database/workspace connection:** The connection named in the action, not merely the most recent connection.
- **Files that should already exist:** Only files from verified earlier phases. Do not pre-create the full tree.
- **Files that should not exist yet:** New Phase 20 files remain absent until their creation lesson.
- **Terminal prompt:** It should end in the expected repository path or another explicitly named folder.
- **Previous verification:** Phase 19 must be verified when this phase has a prerequisite.

## Three-level explanation of the phase

---

### Level 1 — Child-simple explanation

Imagine building a store from labeled boxes. This phase handles one box, checks that the label is correct, and makes sure the next box receives the right thing. You do not pour all boxes together and hope the result is understandable.

### Level 2 — Northstar Retail project explanation

Phase 20 creates the specific Northstar Retail files, database objects, transformations, tests, model objects, or evidence described in the lessons. Every output keeps a visible connection to its source and batch so you can trace an order, customer, product, campaign, return, shipment, or inventory record.

### Level 3 — Professional explanation

This phase establishes a controlled boundary in an end-to-end batch platform. It defines contracts, execution context, idempotency behavior, quality expectations, evidence, and handoff artifacts so the downstream layer can be reproduced and reviewed independently.

## Applications to open

---

VS Code Markdown Preview, GitHub repository page, File Explorer, and image editor only for redaction/cropping. Open only the application needed for the immediate action. Extra windows increase the chance of typing a command into the wrong context.

## Phase status gate

---

☐

I changed this phase from [ ] Not started to [-] In progress in the master tracker.

☐

I verified the repository root when repository work is required.

☐

I verified the current branch.

☐

I identified the exact server/database, Databricks workspace/catalog/schema, or Power BI file.

☐

I read the phase ordering explanation.

## What your screen should look like now

---

- The Phase 20 lesson index, starting-screen checklist, and three explanation levels remain visible in this workbook.
- Only the applications required for the next lesson are open; no installer, database transaction, notebook run, or Power BI refresh was started merely to read orientation material.
- The intended repository path, active branch, server/database, Databricks workspace, or Power BI file has been written down when it applies.
- No new Phase 20 project file or object has been created yet unless the lesson explicitly instructed you to create it.
- The Phase 20 master-tracker row is marked [-] In progress only after you personally updated it.

## Lesson 20.1 completion checklist

---

☐

I read why Phase 20 happens now — [STATUS]

☐

I can give the child-simple, Northstar-specific, and professional explanations — [STATUS]

☐

I identified the exact applications and execution context required next — [STATUS]

☐

I verified prerequisites instead of assuming they are complete — [STATUS]

☐

I updated the progress tracker myself — [STATUS]

## Safe stopping point

No command, database transaction, Databricks run, loader, or Power BI refresh should be active after this orientation lesson. Save any journal note you created. You may close the workbook viewer and applications. When returning, reopen [Lesson 20.2](#), re-read its starting-screen checklist, and verify the repository root, branch, connection, and workspace before performing an action.

[Back to the Phase 20 lesson index](#)

## Lesson 20.2 — Perform the notebook-guided actions one at a time

### What your screen should look like before starting

The Phase 20 start gate is checked, only the needed application is in front, and the current context has been verified. The following retained lesson material preserves the Northstar terminology and exercise framing; the action cards then turn each hands-on step into a written screen-recording sequence.

### Retained phase lesson, exercises, rules, and expected results

**Track:** Track A required

**Ownership status at start:** Workbook instructions exist; your execution is not yet verified.

**Evidence rule:** Replace placeholders only after the verification steps pass.

### 1. What you are building

A professional README, architecture/data-flow/star-schema/lineage diagrams, data dictionary, source-to-target mapping, test plan, troubleshooting guide, runbook, manifest, screenshot checklist, demo script, resume bullets, LinkedIn draft, limitations, future improvements, and verified evidence map.

### 2. Why it matters

Documentation is how another engineer reviews, runs, trusts, and discusses the system. A strong portfolio explains decisions and evidence without pretending reference code or unexecuted services are completed achievements.

### 3. Words to know

Term	Plain-language definition
README	The repository landing page and primary project overview.
Manifest	An inventory of files, purposes, and learning phases.
Evidence map	A table connecting a claim to a test, screenshot, log, query, or run ID.
Architecture diagram	A system-level picture of components and data movement.
Lineage diagram	A picture of how data fields/tables flow from source to consumption.
Limitation	A known boundary or weakness described honestly.
Future improvement	A justified next step, not a claim that it already exists.
Portfolio narrative	Business problem, design, implementation, verification, learning, and tradeoffs told as one story.
GitHub topic	A repository label that helps discovery, such as data-engineering or databricks.
Screenshot checkpoint	A required image that proves an action performed by the learner.

### 4. What must already be completed

All required implementation phases have a current status, automated tests are green, and any unexecuted external platform step is marked Not started/In progress rather than described as complete.

## 5. Applications to open

Application	How to open it	Why it is open
VS Code	Open README, docs, diagrams, manifest, and checklist.	Edit and preview documentation.
Windows PowerShell	Open in repository root.	Validate links, required files, placeholders, and clean Git state.
GitHub browser	Open the branch/PR and repository preview.	Review rendering and configure description/topics.
Image viewer	Open SVG and your PNG screenshots.	Check legibility and privacy.

## 6. Exact click-by-click steps

**Beginner rhythm:** Read the whole step. Confirm the application and location. Perform only that step. Verify the visible result. Record an error before attempting a fix.

## 7. Exact commands, one code block at a time

## 8. Where each command runs

Never infer the execution location from the code language. The command headings above identify the application and folder/database/catalog. Before every PowerShell command, run `Get-Location`; before SQL, verify the selected database; before Spark, print the catalog/schema/batch widgets.

## TEACHING EXAMPLE

The following small example or reference pattern explains the concept before you attempt Northstar-specific work. Read it, then complete **MY TASK** without copying the answer.

### Line-by-line code explanation

Line or action	Meaning	Why it belongs here
<code>python -m scripts.validation.check_required_files</code>	Checks portfolio-required paths, documentation links, and notebook structure.	A polished narrative with missing files or broken navigation is not publishable.
<code>Get-ChildItem .\docs\images -File   Sort-Object Name   Select-Object Name, Length</code>	Lists diagram and screenshot files with sizes.	Zero-byte/missing evidence files can otherwise be overlooked.
<code>Select-String -Path README.md,docs*.md,powerbi*.md -Pattern '[ADD YOUR TODO(USER) MANUAL-REPLACE-ME]'   Select-Object Path,LineNumber,Line</code>	Finds ownership and verification placeholders.	Every placeholder must remain intentionally unverified or be replaced with evidence.
<code>git status</code>	Shows remaining changes, whitespace errors, and scope.	The final documentation commit should be deliberate and reviewable.

### Claim-to-evidence rule

Write “reference material includes” for reference examples. Write “I verified” only after your checklist points to a run ID, batch ID, query result, test output, or screenshot. Write future tense for unbuilt extensions. The README reference answer deliberately uses placeholders where your own execution must supply proof.

### Diagram formats

Mermaid files are editable text; DOT files provide a second text representation; SVG files are rendered for GitHub/browser viewing. Text alternatives in the documentation explain each diagram when rendering is unavailable.

## MY TASK

Audit and customize the entire portfolio narrative, replace only evidence-backed placeholders, add your screenshots and lessons, verify every link/diagram/file, configure GitHub description/topics, and publish through a reviewed PR.

# STARTER SKELETON

---

```
Verified result: TODO(USER)

- **Claim:** TODO(USER)
- **Business meaning:** TODO(USER)
- **Evidence file/run/query:** TODO(USER)
- **Batch ID and data-through date:** TODO(USER)
- **Validation method:** TODO(USER)
- **Limitation:** TODO(USER)
- **What I personally did:** TODO(USER)
- **What the workbook taught or provided as reference:** TODO(USER)
```

**Acceptance criteria:** The repository tells a coherent business-to-technical story; every referenced file exists; all diagrams and links render; screenshots are private and evidentiary; claims map to proof; limitations and TODOs are explicit; automated checks and documentation PR pass.

## HINT 1 — CONCEPT

---

Review the repository in the order a stranger sees it: title, problem, architecture, evidence, run guide, model, dashboard, tests, limitations.

## HINT 2 — PSEUDOCODE

---

For every achievement sentence ask: what exact file/run/query/screenshot proves it and did I personally execute it?

## HINT 3 — NEAR-COMPLETE PATTERN

---

Use the manifest/checklist/evidence template, search all placeholders, update only those with evidence, run validators, then review the GitHub rendering from a clean browser view.

## 13. Expected files or output

---

- Professional root README with truthful status.
- Complete technical documentation and rendered diagrams.
- the file-responsibility index and final definition-of-done sections in this workbook.
- Verified screenshots and evidence notes.
- Customized resume, LinkedIn, demo, and interview materials.
- Repository description and topics.
- Passing documentation/CI checks.

## 14. How to verify

---

- Every link and referenced path resolves.
- Every diagram matches actual object/task names.
- Every completed claim has evidence.
- No fabricated row count, runtime, KPI, screenshot, or performance statement remains.
- README commands match actual paths and Windows syntax.
- Current status distinguishes planned, created, run, verified, and optional.
- Public screenshots/data contain no real secret or unnecessary identity detail.
- GitHub preview is readable on desktop without local-only links.

## 15. Automated tests

---

- Required-file, link, notebook, SQL dialect, secret, lint, and pytest suite.
- Manifest-to-files comparison.
- Placeholder/claim review.
- Diagram open/render inspection.
- GitHub preview and clean-clone navigation review.
- Interviewer two-minute findability test.

## 16. Common errors and exact fixes

Message/symptom	Likely cause	Exact diagnostic	Safe fix	Verify
README image is broken	Relative path/case differs or SVG was not committed.	Open the raw link relative to README; check exact case with <code>Get-ChildItem</code> .	Correct path/case and commit the image.	GitHub preview renders it.
Manifest references missing file	File was renamed/deleted after manifest generation.	Run <code>required-file/manifest</code> comparison and inspect Git history.	Restore/rename/update the reference and rerun all links.	Manifest and filesystem match.
README claims completed Databricks run without evidence	Template language was not replaced carefully.	Search achievement verbs and check evidence map.	Change to planned/future/status wording or add genuine run evidence.	Every claim is defensible.
GitHub cannot render a huge notebook	Notebook output or embedded data is too large.	Check file size and cell outputs.	Clear unnecessary outputs, keep selected verified samples, and link HTML.	Notebook preview or HTML opens quickly.
Screenshot exposes personal details	Capture included workspace/account/server/browser data.	Zoom and inspect every corner/metadata.	Crop/redact/retake; rotate any exposed secret.	Privacy checklist passes.

For deeper tool-specific diagnosis, use [the troubleshooting index near the end of this workbook](#).

## 17. Explain it in your own words

1. What is the difference between a reference asset and an achievement claim?
2. How does a limitation strengthen rather than weaken a portfolio?
3. What should an interviewer find in the first two minutes?
4. Why are both editable and rendered diagram formats included?

Write your answers in [the learning-journal fields in this phase](the learning-journal fields in this phase). Do not copy the wording above.

## 18. Mini quiz

1. Which document inventories every created file?
2. When may a verified placeholder be replaced with a number?
3. Name two required limitations of Track A.

Record your answers before opening the answer key.

## 19. Screenshot checkpoint

Capture repository landing page, architecture/model diagrams, tests/Actions, source databases, Databricks Job graph, Power BI model/pages, and evidence map according to the [screenshot checkpoints in this workbook](#).

Save the image under `docs/images/` with a descriptive filename. Check that no credential, token, password, or unnecessary personal account detail is visible.

## 20. Git checkpoint and suggested commit message

Run `git status`, review the Source Control diff in VS Code, stage only the intended files, then commit:

```
docs: complete truthful northstar portfolio package
```

Push the feature branch only after tests pass.

## 21. Completion checklist

Use one status per item: Not started, In progress, Verified by me, or Needs troubleshooting.

☐

README narrative reviewed — [STATUS]

☐

All diagrams/links render — [STATUS]

☐

Manifest and checklist match files — [STATUS]

☐

Claims have evidence — [STATUS]

☐

Limitations/future work honest — [STATUS]

☐

Screenshots complete and private — [STATUS]

☐

Career/demo drafts customized — [STATUS]

☐

Portfolio PR and checks pass — [STATUS]

Attempt the task and record what failed before reading the optional reference answer in this phase: [the optional reference-answer section later in this workbook#phase-20](the optional reference-answer section later in this workbook#phase-20). The quiz answer is in [the answer-key section immediately after the quiz in this workbook#phase-20](the answer-key section immediately after the quiz in this workbook#phase-20).

---

**Next phase:** Phase 21 prepares you to explain, defend, troubleshoot, and teach every design choice in interviews.

## Required action cards

---

### Action 20.2.1 — Open root README.md in VS Code Preview. Confirm the first screen states the business problem, local-first ar

---

**Application:**

Visual Studio Code

**Window or panel:**

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

**Starting condition:**

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

**Current folder or location:**

The repository root C:\Users\User\Desktop\Northstar\_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username.

**What you are about to do:**

Open root README.md in VS Code Preview. Confirm the first screen states the business problem, local-first ar. This is one bounded construction or inspection task.

**Why this action comes now:**

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

**Exact physical actions:**

1. Bring the application named above to the front and confirm that no unrelated window has focus.
2. Read the starting condition and compare it with what is visible on your screen.
3. Perform only this immediate task: Open root README.md in VS Code Preview. Confirm the first screen states the business problem, local-first architecture, current verification status, and how to start.
4. Pause while the application finishes the operation; do not click the same control twice.
5. Inspect the visible result before changing another file, object, or setting.
6. Record the actual result in the verification field for this action.

**Command or code:**

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

**Where to enter it:**

Visual Studio Code. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

## What each part means:

### Step 1

#### Action

Open root README.md in VS Code Preview. Confirm the first screen states the business problem, local-first architecture, current verification status, and how to start.

#### Before continuing

☐

I used the application named in this phase.

☐

I confirmed the current folder/database/catalog/schema.

☐

I can describe what changed on the screen or filesystem.

☐

I know which later verification proves this step worked.

#### What should happen:

A visible file, folder, branch, connection, table, notebook, task, relationship, measure, visual, or verification result should appear exactly where the action predicts.

#### Expected example:

Your exact values may differ. The expected result is the same *type* of object and the same required status, not necessarily the same timestamps, row counts, colors, generated IDs, or screen dimensions.

#### What may look different:

Menu wording can vary by product release or account tier. Use the official-source register and look for the described object rather than guessing from an old screenshot.

#### How to verify success:

Reopen or refresh the relevant panel, locate the named object, and inspect the property or output that proves it exists and is in the intended location.

#### Do not continue unless:

You can point to the visible result and explain what it proves. Mark the action VERIFIED BY USER only after that check.

#### Common mistake:

Combining several clicks or decisions, choosing a similarly named object, or continuing because no error dialog appeared.

#### Exact recovery:

Stop at the current screen. Save a screenshot of the error if useful, hide sensitive values, and compare the selected location with the starting condition. Use Back or Cancel rather than Delete or Overwrite. Correct one mismatch and repeat only this action.

#### What you just accomplished:

You completed one observable piece of the Northstar Retail platform and established a checkpoint that can be audited later.

#### How this connects to the project:

The resulting object, decision, or evidence becomes an input to the next stage in the source-to-consumption chain.

[Back to the Phase 20 lesson index](#)

## Action 20.2.2 — Review all Mermaid sources and rendered SVGs under docs/images/. Verify arrows, table names, task names, and

#### Application:

Visual Studio Code

#### Window or panel:

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

**Starting condition:**

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

**Current folder or location:**

The repository root C:\Users\User\Desktop\Northstar\_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username.

**What you are about to do:**

Review all Mermaid sources and rendered SVGs under docs/images/. Verify arrows, table names, task names, and. This is one bounded construction or inspection task.

**Why this action comes now:**

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

**Exact physical actions:**

1. Bring the application named above to the front and confirm that no unrelated window has focus.
2. Read the starting condition and compare it with what is visible on your screen.
3. Perform only this immediate task: Review all Mermaid sources and rendered SVGs under docs/images/. Verify arrows, table names, task names, and Track A/Track B boundaries match the actual files.
4. Pause while the application finishes the operation; do not click the same control twice.
5. Inspect the visible result before changing another file, object, or setting.
6. Record the actual result in the verification field for this action.

**Command or code:**

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

**Where to enter it:**

Visual Studio Code. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

**What each part means:****Step 2****Action**

Review all Mermaid sources and rendered SVGs under docs/images/. Verify arrows, table names, task names, and Track A/Track B boundaries match the actual files.

**Before continuing**☐

I used the application named in this phase.

☐

I confirmed the current folder/database/catalog/schema.

☐

I can describe what changed on the screen or filesystem.

☐

I know which later verification proves this step worked.

**What should happen:**

A visible file, folder, branch, connection, table, notebook, task, relationship, measure, visual, or verification result should appear exactly where the action predicts.

**Expected example:**

Your exact values may differ. The expected result is the same *type* of object and the same required status, not necessarily the same timestamps, row counts, colors, generated IDs, or screen dimensions.

**What may look different:**

Menu wording can vary by product release or account tier. Use the official-source register and look for the described object rather than guessing from an old screenshot.

**How to verify success:**

Reopen or refresh the relevant panel, locate the named object, and inspect the property or output that proves it exists and is in the intended location.

**Do not continue unless:**

You can point to the visible result and explain what it proves. Mark the action VERIFIED BY USER only after that check.

**Common mistake:**

Combining several clicks or decisions, choosing a similarly named object, or continuing because no error dialog appeared.

**Exact recovery:**

Stop at the current screen. Save a screenshot of the error if useful, hide sensitive values, and compare the selected location with the starting condition. Use Back or Cancel rather than Delete or Overwrite. Correct one mismatch and repeat only this action.

**What you just accomplished:**

You completed one observable piece of the Northstar Retail platform and established a checkpoint that can be audited later.

**How this connects to the project:**

The resulting object, decision, or evidence becomes an input to the next stage in the source-to-consumption chain.

## Action 20.2.3 — Open the file-responsibility index in this workbook and confirm every listed file exists. Use it to locate eac

---

**Application:**

Visual Studio Code

**Window or panel:**

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

**Starting condition:**

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

**Current folder or location:**

The repository root C:\Users\User\Desktop\Northstar\_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username.

**What you are about to do:**

Open the file-responsibility index in this workbook and confirm every listed file exists. Use it to locate eac. This is one bounded construction or inspection task.

**Why this action comes now:**

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

**Exact physical actions:**

1. Bring the application named above to the front and confirm that no unrelated window has focus.
2. Read the starting condition and compare it with what is visible on your screen.
3. Perform only this immediate task: Open the file-responsibility index in this workbook and confirm every listed file exists. Use it to locate each phase artifact rather than duplicating explanations randomly.
4. Pause while the application finishes the operation; do not click the same control twice.
5. Inspect the visible result before changing another file, object, or setting.
6. Record the actual result in the verification field for this action.

**Command or code:**

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

**Where to enter it:**

Visual Studio Code. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

**What each part means:**

### Step 3

#### Action

Open the file-responsibility index in this workbook and confirm every listed file exists. Use it to locate each phase artifact rather than duplicating explanations randomly.

#### Before continuing

☐

I used the application named in this phase.

☐

I confirmed the current folder/database/catalog/schema.

☐

I can describe what changed on the screen or filesystem.

☐

I know which later verification proves this step worked.

#### What should happen:

A visible file, folder, branch, connection, table, notebook, task, relationship, measure, visual, or verification result should appear exactly where the action predicts.

#### Expected example:

Your exact values may differ. The expected result is the same *type* of object and the same required status, not necessarily the same timestamps, row counts, colors, generated IDs, or screen dimensions.

#### What may look different:

Menu wording can vary by product release or account tier. Use the official-source register and look for the described object rather than guessing from an old screenshot.

#### How to verify success:

Reopen or refresh the relevant panel, locate the named object, and inspect the property or output that proves it exists and is in the intended location.

#### Do not continue unless:

You can point to the visible result and explain what it proves. Mark the action VERIFIED BY USER only after that check.

#### Common mistake:

Combining several clicks or decisions, choosing a similarly named object, or continuing because no error dialog appeared.

#### Exact recovery:

Stop at the current screen. Save a screenshot of the error if useful, hide sensitive values, and compare the selected location with the starting condition. Use Back or Cancel rather than Delete or Overwrite. Correct one mismatch and repeat only this action.

#### What you just accomplished:

You completed one observable piece of the Northstar Retail platform and established a checkpoint that can be audited later.

#### How this connects to the project:

The resulting object, decision, or evidence becomes an input to the next stage in the source-to-consumption chain.

[Back to the Phase 20 lesson index](#)

## Action 20.2.4 — Review docs/data\_dictionary.md, source-to-target mapping, KPI definitions, lineage, testing strategy, runboo

#### Application:

Visual Studio Code

#### Window or panel:

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

#### Starting condition:

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

**Current folder or location:**

The repository root C:\Users\User\Desktop\Northstar\_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username.

**What you are about to do:**

Review docs/data\_dictionary.md, source-to-target mapping, KPI definitions, lineage, testing strategy, runboo. This is one bounded construction or inspection task.

**Why this action comes now:**

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

**Exact physical actions:**

1. Bring the application named above to the front and confirm that no unrelated window has focus.
2. Read the starting condition and compare it with what is visible on your screen.
3. Perform only this immediate task: Review docs/data\_dictionary.md, source-to-target mapping, KPI definitions, lineage, testing strategy, runbook, risk register, assumption log, security/cost, and troubleshooting. Resolve contradictions with the code.
4. Pause while the application finishes the operation; do not click the same control twice.
5. Inspect the visible result before changing another file, object, or setting.
6. Record the actual result in the verification field for this action.

**Command or code:**

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

**Where to enter it:**

Visual Studio Code. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

**What each part means:****Step 4****Action**

Review docs/data\_dictionary.md, source-to-target mapping, KPI definitions, lineage, testing strategy, runbook, risk register, assumption log, security/cost, and troubleshooting. Resolve contradictions with the code.

**Before continuing**☐

I used the application named in this phase.

☐

I confirmed the current folder/database/catalog/schema.

☐

I can describe what changed on the screen or filesystem.

☐

I know which later verification proves this step worked.

**What should happen:**

A visible file, folder, branch, connection, table, notebook, task, relationship, measure, visual, or verification result should appear exactly where the action predicts.

**Expected example:**

Your exact values may differ. The expected result is the same *type* of object and the same required status, not necessarily the same timestamps, row counts, colors, generated IDs, or screen dimensions.

**What may look different:**

## Action 20.2.5 — Complete the global screenshot checklist. For every image, state what it proves, run/batch/date context, and w

---

**Application:**

Visual Studio Code

**Window or panel:**

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

**Starting condition:**

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

**Current folder or location:**

The repository root C:\Users\User\Desktop\Northstar\_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username.

**What you are about to do:**

Complete the global screenshot checklist. For every image, state what it proves, run/batch/date context, and w. This is one bounded construction or inspection task.

**Why this action comes now:**

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

**Exact physical actions:**

1. Bring the application named above to the front and confirm that no unrelated window has focus.
2. Read the starting condition and compare it with what is visible on your screen.
3. Perform only this immediate task: Complete the global screenshot checklist. For every image, state what it proves, run/batch/date context, and what sensitive content was checked.
4. Pause while the application finishes the operation; do not click the same control twice.
5. Inspect the visible result before changing another file, object, or setting.
6. Record the actual result in the verification field for this action.

**Command or code:**

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

**Where to enter it:**

Visual Studio Code. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

**What each part means:**

### Step 5

**Action**

Complete the global screenshot checklist. For every image, state what it proves, run/batch/date context, and what sensitive content was checked.

### Before continuing

☐

I used the application named in this phase.

☐

I confirmed the current folder/database/catalog/schema.

☐

I can describe what changed on the screen or filesystem.

☐

I know which later verification proves this step worked.

### What should happen:

A visible file, folder, branch, connection, table, notebook, task, relationship, measure, visual, or verification result should appear exactly where the action predicts.

### Expected example:

Your exact values may differ. The expected result is the same *type* of object and the same required status, not necessarily the same timestamps, row counts, colors, generated IDs, or screen dimensions.

The resulting object, decision, or evidence becomes an input to the next stage in the source-to-consumption chain.

[Back to the Phase 20 lesson index](#)

## Action 20.2.6 — Replace only verified placeholders such as [ADD YOUR VERIFIED ROW COUNT]. Leave unverified placeholders visi

### Application:

Visual Studio Code

### Window or panel:

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

### Starting condition:

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

### Current folder or location:

The repository root C:\Users\User\Desktop\Northstar\_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username.

**What you are about to do:**

Replace only verified placeholders such as [ADD YOUR VERIFIED ROW COUNT]. Leave unverified placeholders visible. This is one bounded construction or inspection task.

**Why this action comes now:**

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

**Exact physical actions:**

1. Bring the application named above to the front and confirm that no unrelated window has focus.
2. Read the starting condition and compare it with what is visible on your screen.
3. Perform only this immediate task: Replace only verified placeholders such as [ADD YOUR VERIFIED ROW COUNT]. Leave unverified placeholders visible or remove the unsupported claim; never guess.
4. Pause while the application finishes the operation; do not click the same control twice.
5. Inspect the visible result before changing another file, object, or setting.
6. Record the actual result in the verification field for this action.

**Command or code:**

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

**Where to enter it:**

Visual Studio Code. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

**What each part means:****Step 6****Action**

Replace only verified placeholders such as [ADD YOUR VERIFIED ROW COUNT]. Leave unverified placeholders visible or remove the unsupported claim; never guess.

**Before continuing**☐

I used the application named in this phase.

☐

I confirmed the current folder/database/catalog/schema.

☐

I can describe what changed on the screen or filesystem.

☐

I know which later verification proves this step worked.

**What should happen:**

A visible file, folder, branch, connection, table, notebook, task, relationship, measure, visual, or verification result should appear exactly where the action predicts.

**Expected example:**

Your exact values may differ. The expected result is the same *type* of object and the same required status, not necessarily the same timestamps, row counts, colors, generated IDs, or screen dimensions.

**What may look different:**

Menu wording can vary by product release or account tier. Use the official-source register and look for the described object rather than guessing from an old screenshot.

**How to verify success:**

Reopen or refresh the relevant panel, locate the named object, and inspect the property or output that proves it exists and is in the intended location.

**Do not continue unless:**

You can point to the visible result and explain what it proves. Mark the action VERIFIED BY USER only after that check.

**Common mistake:**

Combining several clicks or decisions, choosing a similarly named object, or continuing because no error dialog appeared.

**Exact recovery:**

Stop at the current screen. Save a screenshot of the error if useful, hide sensitive values, and compare the selected location with the starting condition. Use Back or Cancel rather than Delete or Overwrite. Correct one mismatch and repeat only this action.

**What you just accomplished:**

You completed one observable piece of the Northstar Retail platform and established a checkpoint that can be audited later.

**How this connects to the project:**

The resulting object, decision, or evidence becomes an input to the next stage in the source-to-consumption chain.

## Action 20.2.7 — Add a section explaining manual Track A upload/download, local services, synthetic data, free-tier quotas, bat

---

**Application:**

Visual Studio Code

**Window or panel:**

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

**Starting condition:**

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

**Current folder or location:**

The repository root C:\Users\User\Desktop\Northstar\_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username.

**What you are about to do:**

Add a section explaining manual Track A upload/download, local services, synthetic data, free-tier quotas, bat. This is one bounded construction or inspection task.

**Why this action comes now:**

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

**Exact physical actions:**

1. Bring the application named above to the front and confirm that no unrelated window has focus.
2. Read the starting condition and compare it with what is visible on your screen.
3. Perform only this immediate task: Add a **Limitations** section explaining manual Track A upload/download, local services, synthetic data, free-tier quotas, batch-only scope, and learner-owned TODO transformations.
4. Pause while the application finishes the operation; do not click the same control twice.
5. Inspect the visible result before changing another file, object, or setting.
6. Record the actual result in the verification field for this action.

**Command or code:**

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

**Where to enter it:**

Visual Studio Code. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

**What each part means:**

### Step 7

**Action**

Add a **Limitations** section explaining manual Track A upload/download, local services, synthetic data, free-tier quotas, batch-only scope, and learner-owned TODO transformations.

**Before continuing**☐

I used the application named in this phase.

☐

I confirmed the current folder/database/catalog/schema.

☐

I can describe what changed on the screen or filesystem.

☐

I know which later verification proves this step worked.

**What should happen:**

A visible file, folder, branch, connection, table, notebook, task, relationship, measure, visual, or verification result should appear exactly where the action predicts.

**Expected example:**

Your exact values may differ. The expected result is the same *type* of object and the same required status, not necessarily the same timestamps, row counts, colors, generated IDs, or screen dimensions.

**What may look different:**

Menu wording can vary by product release or account tier. Use the official-source register and look for the described object rather than guessing from an old screenshot.

**How to verify success:**

Reopen or refresh the relevant panel, locate the named object, and inspect the property or output that proves it exists and is in the intended location.

**Do not continue unless:**

You can point to the visible result and explain what it proves. Mark the action VERIFIED BY USER only after that check.

**Common mistake:**

Combining several clicks or decisions, choosing a similarly named object, or continuing because no error dialog appeared.

**Exact recovery:**

Stop at the current screen. Save a screenshot of the error if useful, hide sensitive values, and compare the selected location with the starting condition. Use Back or Cancel rather than Delete or Overwrite. Correct one mismatch and repeat only this action.

**What you just accomplished:**

You completed one observable piece of the Northstar Retail platform and established a checkpoint that can be audited later.

**How this connects to the project:**

The resulting object, decision, or evidence becomes an input to the next stage in the source-to-consumption chain.

**Where to enter it:**

Visual Studio Code. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

**What each part means:**

## Step 14

### Action

Commit documentation on a branch, open a PR, review rendered diffs and screenshots, then merge after checks pass.

### Before continuing

☐

I used the application named in this phase.

☐

I confirmed the current folder/database/catalog/schema.

☐

I can describe what changed on the screen or filesystem.

☐

I know which later verification proves this step worked.

### What should happen:

A visible file, folder, branch, connection, table, notebook, task, relationship, measure, visual, or verification result should appear exactly where the action predicts.

### Expected example:

Your exact values may differ. The expected result is the same *type* of object and the same required status, not necessarily the same timestamps, row counts, colors, generated IDs, or screen dimensions.

### What may look different:

Menu wording can vary by product release or account tier. Use the official-source register and look for the described object rather than guessing from an old screenshot.

### How to verify success:

Reopen or refresh the relevant panel, locate the named object, and inspect the property or output that proves it exists and is in the intended location.

### Do not continue unless:

You can point to the visible result and explain what it proves. Mark the action VERIFIED BY USER only after that check.

### Common mistake:

Combining several clicks or decisions, choosing a similarly named object, or continuing because no error dialog appeared.

### Exact recovery:

Stop at the current screen. Save a screenshot of the error if useful, hide sensitive values, and compare the selected location with the starting condition. Use Back or Cancel rather than Delete or Overwrite. Correct one mismatch and repeat only this action.

### What you just accomplished:

You completed one observable piece of the Northstar Retail platform and established a checkpoint that can be audited later.

### How this connects to the project:

The resulting object, decision, or evidence becomes an input to the next stage in the source-to-consumption chain.

[Back to the Phase 20 lesson index](#)

## Action 20.2.C1 — Windows PowerShell

### Application:

Windows PowerShell or the VS Code PowerShell terminal

### Window or panel:

Windows PowerShell

### Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

**Current folder or location:**

The repository root C:\Users\User\Desktop\Northstar\_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username.

**What you are about to do:**

Run one explained Powershell instruction and inspect its result before any next command is introduced.

**Why this action comes now:**

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

**Exact physical actions:**

1. CLICK: Bring **Windows PowerShell or the VS Code PowerShell terminal** to the front.
2. LOOK FOR: Confirm the current location matches The repository root C:\Users\User\Desktop\Northstar\_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

**Command or code (Powershell):**

```
python -m scripts.validation.check_required_files
```

**Where to enter it:**

Windows PowerShell. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

**Plain-English translation:**

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

**What each part means:**

- **Line 1:** `python -m scripts.validation.check_required_files` — `python` invokes Python when that command name is registered; `-m` asks Python to run an installed module; `scripts.validation.check_required_files` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation

**Does it change anything?**

This is intended to inspect or validate state rather than change it.

**Is it safe to rerun?**

Normally safe to rerun because it is observational, but still confirm the execution location first.

**What should happen:**

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

**Expected example:**

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

**What may look different:**

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

**How to verify success:**

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

**Do not continue unless:**

The result is visible, understandable, and recorded as RUN BY USER or VERIFIED BY USER. Displaying this workbook does not count as execution.

**Common mistake:**

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

**Exact recovery:**

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

**What you just accomplished:**

You executed and checked one controlled operation rather than treating a long script as a black box.

**How this connects to the project:**

This verified state becomes a dependable input to the next Northstar Retail construction action.

## Action 20.2.C5 — Windows PowerShell

### Application:

Windows PowerShell or the VS Code PowerShell terminal

### Window or panel:

Windows PowerShell

### Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

### Current folder or location:

The repository root C:\Users\User\Desktop\Northstar\_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username.

### What you are about to do:

Run one explained Powershell instruction and inspect its result before any next command is introduced.

### Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

### Exact physical actions:

1. CLICK: Bring **Windows PowerShell or the VS Code PowerShell terminal** to the front.
2. LOOK FOR: Confirm the current location matches The repository root C:\Users\User\Desktop\Northstar\_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

### Command or code (Powershell):

```
Select-String -Path README.md,docs*.md,powerbi*.md -Pattern '[ADD YOUR|TODO\((USER\)|MANUAL-REPLACE-ME' | Select-Object Path,LineNumber,Line
```

### Where to enter it:

Windows PowerShell. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

### Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

### What each part means:

- **Line 1:** `Select-String -Path README.md,docs\*.md,powerbi\*.md -Pattern '[ADD YOUR|TODO\((USER\)|MANUAL-REPLACE-ME' | Select-Object Path,LineNumber,Line` — `Select-String` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `-Path` is a command option or flag; its exact behavior is defined beside the command; `README.md` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `,` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `docs` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `*` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `md` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `,` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `powerbi` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `*` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `md` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `-Pattern` is a command option or flag; its exact behavior is defined beside the command; remaining punctuation and identifiers continue the same statement.

**Does it change anything?**

This is intended to inspect or validate state rather than change it.

**Is it safe to rerun?**

Normally safe to rerun because it is observational, but still confirm the execution location first.

**What should happen:**

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

**Expected example:**

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

**Command or code (Powershell):**

```
git diff --check
```

**Where to enter it:**

Windows PowerShell. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

**Plain-English translation:**

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

**What each part means:**

- **Line 1:** `git diff --check` — `git` calls the Git version-control program; `diff` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `--check` is a command option or flag; its exact behavior is defined beside the command

**Does it change anything?**

This is intended to inspect or validate state rather than change it.

**Is it safe to rerun?**

Normally safe to rerun because it is observational, but still confirm the execution location first.

**What should happen:**

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

**Expected example:**

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

**What may look different:**

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

**How to verify success:**

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

**Do not continue unless:**

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

**Common mistake:**

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

**Exact recovery:**

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

**What you just accomplished:**

You executed and checked one controlled operation rather than treating a long script as a black box.

**How this connects to the project:**

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 20 lesson index](#)

## Action 20.2.C8 — Windows PowerShell

**Application:**

Windows PowerShell or the VS Code PowerShell terminal

**Window or panel:**

Windows PowerShell

**Starting condition:**

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

**Current folder or location:**

The repository root `C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project`. The User segment is an example; verify your real Windows username.

**What you are about to do:**

Run one explained Powershell instruction and inspect its result before any next command is introduced.

**Why this action comes now:**

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

**Exact physical actions:**

1. CLICK: Bring **Windows PowerShell or the VS Code PowerShell terminal** to the front.

2. LOOK FOR: Confirm the current location matches The repository root C:\Users\User\Desktop\Northstar\_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

#### Command or code (Powershell):

```
git diff --stat
```

#### Where to enter it:

Windows PowerShell. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

#### Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

#### What each part means:

- **Line 1:** `git diff --stat` — `git` calls the Git version-control program; `diff` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `--stat` is a command option or flag; its exact behavior is defined beside the command

#### Does it change anything?

This is intended to inspect or validate state rather than change it.

#### Is it safe to rerun?

Normally safe to rerun because it is observational, but still confirm the execution location first.

#### What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

#### Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

#### What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

#### How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

#### Do not continue unless:

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

#### Common mistake:

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

#### Exact recovery:

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

### What you just accomplished:

You executed and checked one controlled operation rather than treating a long script as a black box.

### How this connects to the project:

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 20 lesson index](#)

## What your screen should look like now

---

Each action you actually performed has a visible result and a recorded ownership status. You have not marked unrun reference commands as complete. The branch, connection, batch, and application context remain known.

## Lesson 20.2 completion checklist

---

☐

I performed actions in order — [STATUS]

☐

I verified each command location — [STATUS]

☐

I distinguished typed text from observed output — [STATUS]

☐

I recorded differences caused by versions/tier — [STATUS]

☐

I stopped at the first unexplained error — [STATUS]

## Safe stopping point

---

Save open work and record the next action number. Close an application only after its operation is complete. On return, re-open the Phase 20 starting-screen checklist and re-verify the active context.

## Lesson 20.3 — Create and understand the phase files

---

## What your screen should look like before starting

---

VS Code Explorer shows the repository root, the intended feature branch is active, and no Phase 20 file is assumed to exist merely because a reference answer appears below. Create each folder only when its first file is needed.

### Folder introduction — docs/

**Exact folder name:** docs

**Exact parent:** repository root

**Why it is needed now:** Phase 20 is about to place its first responsibility-specific file here; creating it earlier would have produced an unexplained empty structure.

**What will eventually be inside:** Only files whose purpose matches this folder's name.

**Why another folder is not appropriate:** Separation keeps source SQL, transformations, tests, configuration, documentation, and generated artifacts reviewable.

**Naming rules:** Preserve lowercase/uppercase exactly as shown. Hyphens, underscores, spaces, and plural forms create different paths. This project avoids spaces in technical folder names.

### VS Code method

1. CLICK: Open Explorer in VS Code.
2. LOOK FOR: Confirm the repository root is the top folder.
3. Expand the parent path repository root one level at a time.
4. RIGHT-CLICK: Right-click the immediate parent folder.
5. CLICK: **New Folder**.
6. TYPE THIS: docs.
7. PRESS: Enter.
8. LOOK FOR: The folder appears once, at the correct indentation level.

### Action 20.D1.1 — Create the folder docs

---

**Application:**

Windows PowerShell or the VS Code PowerShell terminal

**Window or panel:**

VS Code integrated PowerShell terminal at the repository root

**Starting condition:**

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

**Current folder or location:**

The repository root C:\Users\User\Desktop\Northstar\_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username.

**What you are about to do:**

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

**Why this action comes now:**

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

**Exact physical actions:**

1. CLICK: Bring **Windows PowerShell or the VS Code PowerShell terminal** to the front.
2. LOOK FOR: Confirm the current location matches The repository root C:\Users\User\Desktop\Northstar\_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

**Command or code (PowerShell):**

```
New-Item -ItemType Directory -Path ".\docs" -ErrorAction Stop
```

**Where to enter it:**

VS Code integrated PowerShell terminal at the repository root. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

**Plain-English translation:**

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

**What each part means:**

- **Line 1:** New-Item -ItemType Directory -Path ".\docs" -ErrorAction Stop — New-Item creates a file or folder; -ItemType is a command option or flag; its exact behavior is defined beside the command; Directory is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; -Path is a command option or flag; its exact behavior is defined beside the command; ".\docs" is a path, relative location, branch-style name, or file argument; verify every character before running it; -ErrorAction is a command option or flag; its exact behavior is defined beside the command; Stop is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation

**Does it change anything?**

This can change files, Git state, packages, database objects, or data.

**Is it safe to rerun?**

Safe to rerun only after reading the idempotency note and confirming that the same batch, file, or object will not be duplicated.

**What should happen:**

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

**Expected example:**

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

**What may look different:**

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

**How to verify success:**

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

**Do not continue unless:**

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

**Common mistake:**

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

**Exact recovery:**

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

**What you just accomplished:**

You executed and checked one controlled operation rather than treating a long script as a black box.

**How this connects to the project:**

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 20 lesson index](#)

**Folder-creation decision branches****If the folder is created**

Run `Test-Path -LiteralPath ".\docs" -PathType Container` and require `True`.

**If PowerShell says the folder already exists**

Do not delete or recreate it. Run `Get-ChildItem -LiteralPath ".\docs" -Force`, inspect its existing files, and preserve them. Continue only when the existing folder is the intended path.

**If the parent path does not exist**

Return to the parent-folder tutorial. Create and verify one parent level at a time; do not create the entire future tree in one command.

**Verify the folder**

1. Run `Test-Path ".\docs" -PathType Container`.
2. Require the output `True` before creating a child file.
3. Remember: Git does not track an empty folder by itself; the folder becomes visible in Git history when a tracked file is added.

**File introduction — README.md**

**Exact filename:** `README.md`

**Filename extension:** `.md`. In this project it identifies project documentation and helps the correct application choose syntax highlighting or execution behavior.

**Exact parent folder:** `.` relative to the repository root.

**Why this file belongs there:** Files with the same responsibility are grouped so a reviewer can find configuration, source

SQL, transformations, tests, documentation, and report assets without guessing.

**What the file will contain:** project documentation for Phase 20.

**Later dependencies:** Later phase commands, tests, GitHub Actions, Databricks tasks, warehouse loads, Power BI work, or portfolio evidence may depend on its exact path.

**Should Git track it?** Yes, unless the lesson explicitly identifies it as generated data, a local secret, a log, or a machine-specific artifact.

**Could it contain secrets?** It should not contain live passwords, tokens, connection strings, or account identifiers.

**What happens if it is missing:** The corresponding phase cannot be reproduced, validated, or explained from the repository alone.

### VS Code click path

1. CLICK: In VS Code, open **Explorer** from the left Activity Bar.
2. LOOK FOR: Confirm the top-level folder name is SQL-Data-Warehouse-Project and the status bar shows the intended Git branch.
3. CLICK: Expand each parent folder in . one level at a time.
4. If a parent folder does not exist, use the folder tutorial in this phase before creating the file.
5. RIGHT-CLICK: Right-click the immediate parent folder.
6. CLICK: Select **New File**.
7. TYPE THIS: README.md.
8. PRESS: Enter.
9. LOOK FOR: A new editor tab labeled README.md and an empty file under the correct parent folder.
10. PRESS: Ctrl+S after adding each explained section.

### PowerShell path

## Action 20.F1.1 — Create the file README.md from PowerShell

---

#### Application:

Windows PowerShell or the VS Code PowerShell terminal

#### Window or panel:

VS Code integrated PowerShell terminal opened at the repository root

#### Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

#### Current folder or location:

The repository root C:\Users\User\Desktop\Northstar\_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username.

#### What you are about to do:

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

#### Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

#### Exact physical actions:

1. CLICK: Bring **Windows PowerShell or the VS Code PowerShell terminal** to the front.
2. LOOK FOR: Confirm the current location matches The repository root C:\Users\User\Desktop\Northstar\_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

#### Command or code (PowerShell):

```
New-Item -ItemType File -Path ".\README.md" -ErrorAction Stop
```

**Where to enter it:**

VS Code integrated PowerShell terminal opened at the repository root. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

**Plain-English translation:**

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

**What each part means:**

- **Line 1:** `New-Item -ItemType File -Path ".\README.md" -ErrorAction Stop` — `New-Item` creates a file or folder; `-ItemType` is a command option or flag; its exact behavior is defined beside the command; `File` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `-Path` is a command option or flag; its exact behavior is defined beside the command; `".\README.md"` is a path, relative location, branch-style name, or file argument; verify every character before running it; `-ErrorAction` is a command option or flag; its exact behavior is defined beside the command; `Stop` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation

**Does it change anything?**

This can change files, Git state, packages, database objects, or data.

**Is it safe to rerun?**

Safe to rerun only after reading the idempotency note and confirming that the same batch, file, or object will not be duplicated.

**What should happen:**

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

**Expected example:**

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

**What may look different:**

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

**How to verify success:**

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

**Do not continue unless:**

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

**Common mistake:**

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

**Exact recovery:**

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

**What you just accomplished:**

You executed and checked one controlled operation rather than treating a long script as a black box.

**How this connects to the project:**

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 20 lesson index](#)

## File-creation decision branches

### If the command creates the file

Run `Test-Path -LiteralPath ".\README.md" -PathType Leaf`. Continue only when it returns `True` and the file is empty because you just created it.

### If PowerShell says the file already exists

Do not add `-Force`, do not clear the file, and do not overwrite it. Open the existing file in VS Code, run `git status --short -- "README.md"`, inspect its contents and Git history, and decide whether this lesson should edit the preserved file rather than create a new one.

### If PowerShell says part of the path does not exist

Stop. Create only the missing parent folder through the earlier folder tutorial, verify it with `Test-Path -PathType Container`, and rerun this one file command.

## File-content construction

1. Start with the smallest header, comment, or first section shown in the phase lesson.
2. Read the purpose before typing the section.
3. Add one logical section at a time.
4. Save with `Ctrl+S`.
5. Run the syntax or content validation named in the phase.
6. Correct the first error before adding another section.
7. Use `TODO(USER)` where the workbook requires your own decision or verified value.

## File verification

1. In the VS Code Explorer, confirm the file appears under `..`.
2. Right-click the editor tab and choose **Copy Path**; compare the ending with `README.md`.
3. In PowerShell at the repository root, run `Test-Path ".\README.md"` and require `True`.
4. Run `git status --short -- "README.md"` to see only this file's Git state.
5. Run the phase-specific validator before committing.

## Optional reference answer for README.md

Attempt the file construction first. This reference is learning material, not evidence that you created or ran the file.

**Language:** Markdown

**Exact file:** `README.md`

**Purpose:** project documentation.

**Inputs:** The requirements, configuration, source data, or upstream objects described in Phase 20.

**Expected outputs:** The file's declared objects, logs, tables, checks, or documentation when the user later runs or reads it.

```
Northstar Retail End-to-End Data Platform

> A beginner-owned, evidence-driven portfolio project for learning SQL Server, PostgreSQL, Python, Databricks, Delta Lake, dimensional modeling, Lakeflow Jobs, SQL Server warehousing, and Power BI.

Original repository: https://github.com/Losboules/SQL-Data-Warehouse-Project
Reference design assembled: 2026-08-16
Status: This is an instructional reference. Kirolos must manually create, run, test, and verify each component before claiming it as completed.

Business problem

Northstar Retail is a fictional omnichannel retailer. Leadership receives inconsistent answers because ERP sales/inventory, website behavior, marketing, shipments, returns, and supplier updates live in separate systems. This project creates a governed daily path from those sources to trusted dimensions, facts, KPIs, and a Power BI report.

Architecture

(docs/images/overall_architecture.svg)

Track A – default local-first path

1. Generate fictional source files with Python.
2. Load ERP data into local SQL Server and digital data into local PostgreSQL.
3. Extract timestamped Parquet/file batches with manifests and checksums.
4. Manually upload one batch folder to a Databricks Unity Catalog volume.
5. Run parameterized Bronze, Silver, Gold, quality, and publication tasks.
6. Download the validated Gold export.
7. Load it transactionally into local `NorthstarRetail_DW`.
8. Import the star schema into Power BI and validate every measure against SQL.
```

Databricks does **not** connect to the local machine's `localhost` in Track A. Manual upload/download steps are explicit learning boundaries.

### ### Track B – optional cloud-connected path

Use network-accessible managed SQL Server/Azure SQL and PostgreSQL, supported JDBC connections, controlled firewall/private networking, secret-managed identities, and cloud storage. This can incur database, compute, storage, egress, networking, and BI costs.

### ## Technology stack

```
| Area | Technology |
|---|---|
| Version control | Git, GitHub, GitHub Actions |
| Local development | Windows PowerShell, VS Code, Python 3.13.x |
| ERP source and serving warehouse | SQL Server + SSMS |
| Digital source | PostgreSQL + pgAdmin/psql |
| Lakehouse | Databricks, PySpark, Spark SQL, Delta Lake, Unity Catalog volumes |
| Orchestration | Databricks Lakeflow Jobs |
| Modeling | Bronze/Silver/Gold, star schema, SCD Type 1/2, unknown members |
| Semantic/consumption | Power BI and Databricks SQL views |
| Trust | pytest, SQL assertions, quality tables, manifests, checksums, reconciliation |
```

### ## Data sources

- SQL Server ERP: customers, addresses, products, categories, suppliers, stores, employees, orders, items, payments, shipments, inventory movements and snapshots.
- PostgreSQL digital: users, sessions, events, campaigns, touchpoints, and marketing spend.
- Files: returns CSV, supplier cost updates CSV, promotion calendar CSV, nested shipment tracking JSONL.

See [``docs/data_dictionary.md``](docs/data\_dictionary.md) and [``docs/source_to_target_mapping.md``](docs/source\_to\_target\_mapping.md).

### ## Pipeline flow

`SQL Server ERP + PostgreSQL digital + CSV/JSON feeds → timestamped local extraction batch → Databricks Bronze → Silver → Gold → blocking quality gate → Gold export → NorthstarRetail\_DW → Power BI / analyst SQL.`

Track A deliberately uses manual upload and download boundaries; Track B replaces those boundaries with network-accessible sources and secured cloud storage.

### ## Medallion layers

- **Bronze**: raw values, source file/system, ingestion timestamp, batch ID, and record hash.
- **Silver**: typed, trimmed, standardized, deduplicated, conformed, quality-flagged, and quarantined records.
- **Gold**: nine dimensions, six facts, SCD2 history for customer/product, unknown members, and governed aggregates/views.

### ## Data model

![Gold star schema](docs/images/gold\_star\_schema.svg)

Every fact's grain is documented in the workbook and data dictionary. `fact\_sales` is one valid order item. Inventory is a periodic snapshot and must not be summed across dates without a deliberate calculation.

### ## Data-quality strategy

The generator intentionally creates controlled defects. Silver handles them with explicit rules and quarantine. Required tests cover not-null, uniqueness, accepted values, referential integrity, date/numeric ranges, freshness, schema drift, duplicate batches, source/layer reconciliation, SCD behavior, and revenue arithmetic. Publication depends on a passing quality gate.

### ## Orchestration

![Lakeflow Jobs dependency](docs/images/jobs\_dependency.svg)

The version-controlled example is [``databricks/jobs/job_definition.example.yml``](databricks/jobs/job\_definition.example.yml). Every task path exists in `databricks/notebooks`.

### ## Semantic model and dashboard

Power BI uses single-direction dimension-to-fact relationships, a marked date table, explicit measures, display folders, descriptions, and validation SQL. Report pages cover executive, sales, products, stores, customers, marketing, inventory, shipping/returns, and data quality. No `.pbix` or result screenshot is fabricated.

### ## How to run the project safely

#### ### 1. Clone the existing repository

Run in **Windows PowerShell**, from the parent folder where you want the clone:

```
```powershell
git clone https://github.com/Losboules/SQL-Data-Warehouse-Project.git
```

```
Set-Location .\SQL-Data-Warehouse-Project
```

```
git switch -c feature/northstar-platform
```

2. Create Python environment

Run in **Windows PowerShell**, from the repository root:

```
py -3.13 -m venv .venv
```

```
Set-ExecutionPolicy -Scope Process -ExecutionPolicy Bypass
```

```
.\.venv\Scripts\Activate.ps1
```

```
python -m pip install --upgrade pip
```

```
python -m pip install -r requirements-dev.txt
```

3. Generate and validate quick data

```
python -m scripts.data_generation.generate_northstar_data --scale quick --seed 20260815 --output-dir datasets\sample
```

```
python -m scripts.validation.validate_generated_data --input-dir datasets\sample
```

4. Run local checks

```
python -m scripts.validation.check_required_files
python -m scripts.validation.validate_sql_dialects
python -m scripts.validation.validate_notebooks
python -m scripts.validation.scan_secrets
python -m scripts.validation.validate_markdown_links
python -m pytest -q
```

Follow the single manual-build workbook during construction. Keep this README limited to repository facts and evidence you have personally verified.

Repository structure

```
SQL-Data-Warehouse-Project/
├─ README.md, LICENSE, configuration and dependency files
├─ datasets/           # small sample, ignored raw batches, issue fixtures
├─ docs/              # workbook, phase chapters, diagrams, contracts, portfolio docs
├─ notebooks/         # GitHub showcase notebook and HTML
├─ scripts/           # setup, generation, extraction, loading, validation, utilities
├─ sql/              # dialect-separated SQL Server, PostgreSQL, Databricks SQL
├─ databricks/        # source notebooks and job definition
├─ powerbi/          # model, DAX, page requirements, screenshot checklist
├─ tests/            # unit, integration, data-quality, reconciliation
└─ .github/          # Actions, issue, and pull-request templates
```

During construction, use the file-responsibility index inside the manual-build workbook; do not create a separate file-manifest document.

Screenshots

Replace these placeholders with your own verified evidence:

- [ADD YOUR VERIFIED ROW COUNT]
- [ADD PHASE 4 SOURCE DATABASE SCREENSHOT]
- [ADD PHASE 14 JOB RUN SCREENSHOT]

Limitations

- Track A has manual cloud handoffs and daily batch latency.
- The sample and quick generator are reference material; record your own local test result before claiming verification. External-platform execution is not claimed.

- Beginner reporting assumes USD and simplified converting-session attribution.
- The Gold fact notebook reference includes a fact_sales teaching pattern and TODO(USER) ownership work for the remaining facts; optional answers appear only inside the manual-build workbook.
- The project is educational, not production certification.

Future improvements

See [docs/optional_extensions.md](#). Choose one only after the required checklist is personally verified.

What I learned

Replace this section after completion. Suggested prompts: How did grain prevent a mistake? Which failure did the quality gate catch? Why was SCD2 needed? What made a rerun safe? How did SQL and DAX validation differ?

[Back to the Phase 20 lesson index](#phase-20-lesson-index)

File introduction – `docs/claim\_to\_evidence\_map.md`

Exact filename: `claim\_to\_evidence\_map.md`

Filename extension: `.md`. In this project it identifies project documentation and helps the correct application choose syntax highlighting or execution behavior.

Exact parent folder: `docs` relative to the repository root.

Why this file belongs there: Files with the same responsibility are grouped so a reviewer can find configuration, source SQL, transformations, tests, documentation, and report assets without guessing.

What the file will contain: project documentation for Phase 20.

Later dependencies: Later phase commands, tests, GitHub Actions, Databricks tasks, warehouse loads, Power BI work, or portfolio evidence may depend on its exact path.

Should Git track it? Yes, unless the lesson explicitly identifies it as generated data, a local secret, a log, or a machine-specific artifact.

Could it contain secrets? It should not contain live passwords, tokens, connection strings, or account identifiers.

What happens if it is missing: The corresponding phase cannot be reproduced, validated, or explained from the repository alone.

VS Code click path

1. CLICK: In VS Code, open **Explorer** from the left Activity Bar.
2. LOOK FOR: Confirm the top-level folder name is `SQL-Data-Warehouse-Project` and the status bar shows the intended Git branch.
3. CLICK: Expand each parent folder in `docs` one level at a time.
4. If a parent folder does not exist, use the folder tutorial in this phase before creating the file.
5. RIGHT-CLICK: Right-click the immediate parent folder.
6. CLICK: Select **New File**.
7. TYPE THIS: `claim\_to\_evidence\_map.md`.
8. PRESS: Enter.
9. LOOK FOR: A new editor tab labeled `claim\_to\_evidence\_map.md` and an empty file under the correct parent folder.
10. PRESS: Ctrl+S after adding each explained section.

PowerShell path

Action 20.F2.1 – Create the file `docs/claim\_to\_evidence\_map.md` from PowerShell

Application:

Windows PowerShell or the VS Code PowerShell terminal

Window or panel:

VS Code integrated PowerShell terminal opened at the repository root

Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

```

**Current folder or location:**
The repository root `C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project`. The `User` segment is an example; verify your real Windows username.

**What you are about to do:**
Run one explained PowerShell instruction and inspect its result before any next command is introduced.

**Why this action comes now:**
The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

**Exact physical actions:**

1. CLICK: Bring **Windows PowerShell or the VS Code PowerShell terminal** to the front.
2. LOOK FOR: Confirm the current location matches `The repository root `C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project`. The `User` segment is an example; verify your real Windows username.` or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

**Command or code (PowerShell):**

``powershell
New-Item -ItemType File -Path ".\docs\claim_to_evidence_map.md" -ErrorAction Stop

```

Where to enter it:

VS Code integrated PowerShell terminal opened at the repository root. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

What each part means:

- **Line 1:** `New-Item -ItemType File -Path ".\docs\claim_to_evidence_map.md" -ErrorAction Stop` — `New-Item` creates a file or folder; `-ItemType` is a command option or flag; its exact behavior is defined beside the command; `File` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `-Path` is a command option or flag; its exact behavior is defined beside the command; `".\docs\claim_to_evidence_map.md"` is a path, relative location, branch-style name, or file argument; verify every character before running it; `-ErrorAction` is a command option or flag; its exact behavior is defined beside the command; `Stop` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation

Does it change anything?

This can change files, Git state, packages, database objects, or data.

Is it safe to rerun?

Safe to rerun only after reading the idempotency note and confirming that the same batch, file, or object will not be duplicated.

What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

Do not continue unless:

The result is visible, understandable, and recorded as RUN BY USER or VERIFIED BY USER. Displaying this workbook does not count as execution.

Common mistake:

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

Exact recovery:

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

What you just accomplished:

You executed and checked one controlled operation rather than treating a long script as a black box.

How this connects to the project:

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 20 lesson index](#)

File-creation decision branches**If the command creates the file**

Run `Test-Path -LiteralPath ".\docs\claim_to_evidence_map.md" -PathType Leaf`. Continue only when it returns True and the file is empty because you just created it.

If PowerShell says the file already exists

Do not add `-Force`, do not clear the file, and do not overwrite it. Open the existing file in VS Code, run `git status --short -- "docs/claim_to_evidence_map.md"`, inspect its contents and Git history, and decide whether this lesson should edit the preserved file rather than create a new one.

If PowerShell says part of the path does not exist

Stop. Create only the missing parent folder through the earlier folder tutorial, verify it with `Test-Path -PathType Container`, and rerun this one file command.

File-content construction

1. Start with the smallest header, comment, or first section shown in the phase lesson.
2. Read the purpose before typing the section.
3. Add one logical section at a time.
4. Save with Ctrl+S.
5. Run the syntax or content validation named in the phase.
6. Correct the first error before adding another section.
7. Use `TODO(USER)` where the workbook requires your own decision or verified value.

File verification

1. In the VS Code Explorer, confirm the file appears under docs.
2. Right-click the editor tab and choose **Copy Path**; compare the ending with `docs/claim_to_evidence_map.md`.
3. In PowerShell at the repository root, run `Test-Path ".\docs\claim_to_evidence_map.md" and require True`.
4. Run `git status --short -- "docs/claim_to_evidence_map.md"` to see only this file's Git state.
5. Run the phase-specific validator before committing.

Optional reference answer for docs/claim_to_evidence_map.md

Attempt the file construction first. This reference is learning material, not evidence that you created or ran the file.

Language: Markdown

Exact file: `docs/claim_to_evidence_map.md`

Purpose: project documentation.

Inputs: The requirements, configuration, source data, or upstream objects described in Phase 20.

Expected outputs: The file's declared objects, logs, tables, checks, or documentation when the user later runs or reads it.

```
# Claim-to-Evidence Map
```

```
Do not convert a reference capability into a personal achievement until the evidence column is complete.
```

```
| Claim | Status | Evidence type | Exact file/run/query | Batch/date/commit | Reviewer note |
```

```

|---|---|---|---|---|
| Quick synthetic fixture is deterministic | Reference only; user verification required | pytest + manifest | `tests/unit/test_generator.py`;
`datasets/sample/generation_manifest.json` | Seed 20260815 | Re-run locally |
| SQL Server ERP is loaded | Not started | SSMS row counts + loader artifact | `[ADD]` | `[ADD]` | Do not claim yet |

[Back to the Phase 20 lesson index](#)

File introduction — docs/resume_bullets.md

Exact filename: resume_bullets.md

Filename extension: .md. In this project it identifies project documentation and helps the correct application choose syntax highlighting or execution behavior.

Exact parent folder: docs relative to the repository root.

Why this file belongs there: Files with the same responsibility are grouped so a reviewer can find configuration, source SQL, transformations, tests, documentation, and report assets without guessing.

What the file will contain: project documentation for Phase 20.

Later dependencies: Later phase commands, tests, GitHub Actions, Databricks tasks, warehouse loads, Power BI work, or portfolio evidence may depend on its exact path.

Should Git track it? Yes, unless the lesson explicitly identifies it as generated data, a local secret, a log, or a machine-specific artifact.

Could it contain secrets? It should not contain live passwords, tokens, connection strings, or account identifiers.

What happens if it is missing: The corresponding phase cannot be reproduced, validated, or explained from the repository alone.

VS Code click path

1. CLICK: In VS Code, open **Explorer** from the left Activity Bar.
2. LOOK FOR: Confirm the top-level folder name is SQL-Data-Warehouse-Project and the status bar shows the intended Git branch.
3. CLICK: Expand each parent folder in docs one level at a time.
4. If a parent folder does not exist, use the folder tutorial in this phase before creating the file.
5. RIGHT-CLICK: Right-click the immediate parent folder.
6. CLICK: Select **New File**.
7. TYPE THIS: `resume_bullets.md`.
8. PRESS: Enter.
9. LOOK FOR: A new editor tab labeled `resume_bullets.md` and an empty file under the correct parent folder.
10. PRESS: Ctrl+S after adding each explained section.

PowerShell path

Action 20.F3.1 — Create the file `docs/resume_bullets.md` from PowerShell

Application:

Windows PowerShell or the VS Code PowerShell terminal

Window or panel:

VS Code integrated PowerShell terminal opened at the repository root

Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

Current folder or location:

The repository root `C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project`. The User segment is an example; verify your real Windows username.

What you are about to do:

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

Exact physical actions:

1. CLICK: Bring **Windows PowerShell or the VS Code PowerShell terminal** to the front.
2. LOOK FOR: Confirm the current location matches The repository root `C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project`. The User segment is an example; verify your real Windows username. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

Command or code (PowerShell):

```
New-Item -ItemType File -Path ".\docs\resume_bullets.md" -ErrorAction Stop
```

Where to enter it:

VS Code integrated PowerShell terminal opened at the repository root. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

What each part means:

- **Line 1:** `New-Item -ItemType File -Path ".\docs\resume_bullets.md" -ErrorAction Stop` — `New-Item` creates a file or folder; `-ItemType` is a command option or flag; its exact behavior is defined beside the command; `File` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `-Path` is a command option or flag; its exact behavior is defined beside the command; `".\docs\resume_bullets.md"` is a path, relative location, branch-style name, or file argument; verify every character before running it; `-ErrorAction` is a command option or flag; its exact behavior is defined beside the command; `Stop` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation

Does it change anything?

This can change files, Git state, packages, database objects, or data.

Is it safe to rerun?

Safe to rerun only after reading the idempotency note and confirming that the same batch, file, or object will not be duplicated.

What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

Do not continue unless:

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

Common mistake:

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

Exact recovery:

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

What you just accomplished:

You executed and checked one controlled operation rather than treating a long script as a black box.

How this connects to the project:

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 20 lesson index](#)

File-creation decision branches

If the command creates the file

Run `Test-Path -LiteralPath ".\docs\resume_bullets.md" -PathType Leaf`. Continue only when it returns True and the file is empty because you just created it.

If PowerShell says the file already exists

Do not add `-Force`, do not clear the file, and do not overwrite it. Open the existing file in VS Code, run `git status --short -- "docs/resume_bullets.md"`, inspect its contents and Git history, and decide whether this lesson should edit the preserved file rather than create a new one.

If PowerShell says part of the path does not exist

Stop. Create only the missing parent folder through the earlier folder tutorial, verify it with `Test-Path -PathType Container`, and rerun this one file command.

File-content construction

1. Start with the smallest header, comment, or first section shown in the phase lesson.
2. Read the purpose before typing the section.
3. Add one logical section at a time.
4. Save with `Ctrl+S`.
5. Run the syntax or content validation named in the phase.
6. Correct the first error before adding another section.
7. Use `TODO(USER)` where the workbook requires your own decision or verified value.

File verification

1. In the VS Code Explorer, confirm the file appears under docs.
2. Right-click the editor tab and choose **Copy Path**; compare the ending with `docs/resume_bullets.md`.
3. In PowerShell at the repository root, run `Test-Path ".\docs\resume_bullets.md"` and require True.
4. Run `git status --short -- "docs/resume_bullets.md"` to see only this file's Git state.
5. Run the phase-specific validator before committing.

Optional reference answer for docs/resume_bullets.md

Attempt the file construction first. This reference is learning material, not evidence that you created or ran the file.

Language: Markdown

Exact file: `docs/resume_bullets.md`

Purpose: project documentation.

Inputs: The requirements, configuration, source data, or upstream objects described in Phase 20.

Expected outputs: The file's declared objects, logs, tables, checks, or documentation when the user later runs or reads it.

```
# Resume Bullet Drafts

Use only after replacing bracketed placeholders with results you personally verified. Do not list the project as production experience.

- Built a portfolio-scale omnichannel data platform integrating synthetic SQL Server ERP, PostgreSQL digital, CSV, and nested JSON sources through Python batch extraction and Databricks Delta Bronze/Silver/Gold layers; verified `[ADD SOURCE COUNT]` sources and `[ADD VERIFIED ROW COUNT]` Gold rows.
- Designed a dimensional warehouse with nine conformed dimensions and six fact tables, including SCD Type 2 customer/product history, unknown-member handling, declared fact grains, and source-to-target mappings.
- Orchestrated a parameterized Lakeflow Job with dependency-aware Bronze, Silver, Gold, quality-gate, publication, and reconciliation tasks; demonstrated idempotent repair behavior using batch ID `[ADD BATCH ID]`.
- Implemented data-quality and reconciliation checks for uniqueness, referential integrity, ranges, freshness, schema drift, quarantine, and revenue, achieving `[ADD VERIFIED PASS COUNT]` required checks after resolving `[ADD REAL ISSUE]`.
- Published validated Gold data to a local SQL Server serving warehouse and built a Power BI star model with documented DAX for revenue, gross margin, return rate, delivery, conversion, ROAS, customers, and inventory; reconciled dashboard measures to SQL within `[ADD VERIFIED TOLERANCE]`.
- Added GitHub Actions checks for Python lint/tests, required artifacts, SQL dialect labels, notebook syntax, secret patterns, and relative documentation links.

## One-line project description

`Northstar Retail Data Platform – a beginner-built, evidence-driven batch lakehouse and dimensional warehouse portfolio using SQL Server, PostgreSQL, Python, Databricks, Delta Lake, Jobs, and Power BI.`
```

Line-by-line explanation

- **Line 1:** `# Resume Bullet Drafts` is a comment for a human reader; it normally does not change data or execute business logic.

- **Line 2:** blank line used only to separate logical sections for readability.
- **Line 3:** Use only after replacing bracketed placeholders with results you personally verified. Do not list the project as production experience. — Use is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; only is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; after is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; replacing is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; bracketed is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; placeholders is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; with is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; results is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; you is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; personally is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; verified is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; . is a path, relative location, branch-style name, or file argument; verify every character before running it; remaining punctuation and identifiers continue the same statement.
- **Line 4:** blank line used only to separate logical sections for readability.
- **Line 5:** - Built a portfolio-scale omnichannel data platform integrating synthetic SQL Server ERP, PostgreSQL digital, CSV, and nested JSON sources through Python batch extraction and Databricks Delta Bronze/Silver/Gold layers; verified \[ADD SOURCE COUNT] sources and \[ADD VERIFIED ROW COUNT] Gold rows.—is a command option or flag; its exact behavior is defined beside the command; Built is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; a is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; portfolio-scale is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; omnichannel is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; data is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; platform is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; integrating is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; synthetic is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; SQL is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; Server is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; ERP is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; remaining punctuation and identifiers continue the same statement.
- **Line 6:** - Designed a dimensional warehouse with nine conformed dimensions and six fact tables, including SCD Type 2 customer/product history, unknown-member handling, declared fact grains, and source-to-target mappings. — - is a command option or flag; its exact behavior is defined beside the command; Designed is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; a is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; dimensional is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; warehouse is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; with is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; nine is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; conformed is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; dimensions is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; and is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; six is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; fact is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; remaining punctuation and identifiers continue the same statement.
- **Line 7:** - Orchestrated a parameterized Lakeflow Job with dependency-aware Bronze, Silver, Gold, quality-gate, publication, and reconciliation tasks; demonstrated idempotent repair behavior using batch ID \[ADD BATCH ID].—is a command option or flag; its exact behavior is defined beside the command; Orchestrated is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; a is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; parameterized is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; Lakeflow is a name,

keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation;Job is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation;With is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation;dependency-aware is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation;Bronze is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation;; is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation;Silver is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation;; is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; remaining punctuation and identifiers continue the same statement.

- **Line 8:** - Implemented data-quality and reconciliation checks for uniqueness, referential integrity, ranges, freshness, schema drift, quarantine, and revenue, achieving \[ADD VERIFIED PASS COUNT] required checks after resolving \[ADD REAL ISSUE]. — is a command option or flag; its exact behavior is defined beside the command; Implemented is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; data-quality is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; and is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; reconciliation is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; checks is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; for is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; uniqueness is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation;; is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; referential is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; integrity is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation;; is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; remaining punctuation and identifiers continue the same statement.
- **Line 9:** - Published validated Gold data to a local SQL Server serving warehouse and built a Power BI star model with documented DAX for revenue, gross margin, return rate, delivery, conversion, ROAS, customers, and inventory; reconciled dashboard measures to SQL within \[ADD VERIFIED TOLERANCE]. — is a command option or flag; its exact behavior is defined beside the command; Published is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; validated is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; Gold is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; data is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; to is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; a is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; local is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; SQL is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; Server is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; serving is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; warehouse is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; remaining punctuation and identifiers continue the same statement.
- **Line 10:** - Added GitHub Actions checks for Python lint/tests, required artifacts, SQL dialect labels, notebook syntax, secret patterns, and relative documentation links. — is a command option or flag; its exact behavior is defined beside the command; Added is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; GitHub is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; Actions is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; checks is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; for is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; Python is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; lint is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; / is a path, relative location, branch-style name, or file argument; verify every character before running it; tests is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; remaining punctuation and identifiers continue the same statement.

the surrounding explanation; , is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; required is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; remaining punctuation and identifiers continue the same statement.

File introduction — docs/linkedin_post.md

Exact filename: `linkedin_post.md`

Filename extension: `.md`. In this project it identifies project documentation and helps the correct application choose syntax highlighting or execution behavior.

Exact parent folder: `docs` relative to the repository root.

Why this file belongs there: Files with the same responsibility are grouped so a reviewer can find configuration, source SQL, transformations, tests, documentation, and report assets without guessing.

What the file will contain: project documentation for Phase 20.

Later dependencies: Later phase commands, tests, GitHub Actions, Databricks tasks, warehouse loads, Power BI work, or portfolio evidence may depend on its exact path.

Should Git track it? Yes, unless the lesson explicitly identifies it as generated data, a local secret, a log, or a machine-specific artifact.

Could it contain secrets? It should not contain live passwords, tokens, connection strings, or account identifiers.

What happens if it is missing: The corresponding phase cannot be reproduced, validated, or explained from the repository alone.

VS Code click path

1. CLICK: In VS Code, open **Explorer** from the left Activity Bar.
2. LOOK FOR: Confirm the top-level folder name is `SQL-Data-Warehouse-Project` and the status bar shows the intended Git branch.
3. CLICK: Expand each parent folder in `docs` one level at a time.
4. If a parent folder does not exist, use the folder tutorial in this phase before creating the file.
5. RIGHT-CLICK: Right-click the immediate parent folder.
6. CLICK: Select **New File**.
7. TYPE THIS: `linkedin_post.md`.
8. PRESS: Enter.
9. LOOK FOR: A new editor tab labeled `linkedin_post.md` and an empty file under the correct parent folder.
10. PRESS: Ctrl+S after adding each explained section.

PowerShell path

Action 20.F4.1 — Create the file docs/linkedin_post.md from PowerShell

Application:

Windows PowerShell or the VS Code PowerShell terminal

Window or panel:

VS Code integrated PowerShell terminal opened at the repository root

Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

Current folder or location:

The repository root C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username.

What you are about to do:

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

Exact physical actions:

1. CLICK: Bring **Windows PowerShell or the VS Code PowerShell terminal** to the front.
2. LOOK FOR: Confirm the current location matches The repository root C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

Command or code (PowerShell):

```
New-Item -ItemType File -Path ".\docs\linkedin_post.md" -ErrorAction Stop
```

Where to enter it:

VS Code integrated PowerShell terminal opened at the repository root. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

What each part means:

- **Line 1:** New-Item -ItemType File -Path ".\docs\linkedin_post.md" -ErrorAction Stop — New-Item creates a file or folder; -ItemType is a command option or flag; its exact behavior is defined beside the command; File is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; -Path is a command option or flag; its exact behavior is defined beside the command; ".\docs\linkedin_post.md" is a path, relative location, branch-style name, or file argument; verify every character before running it; -ErrorAction is a command option or flag; its exact behavior is defined beside the command; Stop is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation

Does it change anything?

This can change files, Git state, packages, database objects, or data.

Is it safe to rerun?

Safe to rerun only after reading the idempotency note and confirming that the same batch, file, or object will not be duplicated.

What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

Do not continue unless:

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

Common mistake:

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

Exact recovery:

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

What you just accomplished:

You executed and checked one controlled operation rather than treating a long script as a black box.

How this connects to the project:

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 20 lesson index](#)

File-creation decision branches**If the command creates the file**

Run `Test-Path -LiteralPath ".\docs\linkedin_post.md" -PathType Leaf`. Continue only when it returns `True` and the file is empty because you just created it.

If PowerShell says the file already exists

Do not add `-Force`, do not clear the file, and do not overwrite it. Open the existing file in VS Code, run `git status --short -- "docs/linkedin_post.md"`, inspect its contents and Git history, and decide whether this lesson should edit the preserved file rather than create a new one.

If PowerShell says part of the path does not exist

Stop. Create only the missing parent folder through the earlier folder tutorial, verify it with `Test-Path -PathType Container`, and rerun this one file command.

File-content construction

1. Start with the smallest header, comment, or first section shown in the phase lesson.
2. Read the purpose before typing the section.
3. Add one logical section at a time.
4. Save with `Ctrl+S`.
5. Run the syntax or content validation named in the phase.
6. Correct the first error before adding another section.
7. Use `TODO(USER)` where the workbook requires your own decision or verified value.

File verification

1. In the VS Code Explorer, confirm the file appears under docs.

2. Right-click the editor tab and choose **Copy Path**; compare the ending with docs/linkedin_post.md.
3. In PowerShell at the repository root, run Test-Path ".\docs\linkedin_post.md" and require True.
4. Run git status --short -- "docs/linkedin_post.md" to see only this file's Git state.
5. Run the phase-specific validator before committing.

Optional reference answer for docs/linkedin_post.md

Attempt the file construction first. This reference is learning material, not evidence that you created or ran the file.

Language: Markdown

Exact file: docs/linkedin_post.md

Purpose: project documentation.

Inputs: The requirements, configuration, source data, or upstream objects described in Phase 20.

Expected outputs: The file's declared objects, logs, tables, checks, or documentation when the user later runs or reads it.

```
# LinkedIn Post Draft

I have been building Northstar Retail, a fictional end-to-end data engineering portfolio project designed to teach me the decisions behind the tools—not just give me code to copy.

The project connects synthetic SQL Server ERP data, PostgreSQL website/marketing data, and CSV/JSON feeds. I use Python for reproducible data generation and batch manifests, Databricks and Delta Lake for Bronze/Silver/Gold processing, Lakeflow Jobs for dependencies and quality gates, SQL Server as a serving warehouse, and Power BI for the semantic and reporting layer.

The most important lessons so far:

- A fact table must have one explicit grain before measures are written.
- A cloud workspace cannot reach my computer's `localhost`, so the beginner track uses an honest manual file handoff.
- Dirty data is useful when it is controlled: it lets me prove deduplication, quarantine, date parsing, SCD Type 2, and rerun behavior.
- A dashboard number is not trustworthy until it reconciles to source rules and independent SQL.

Verified evidence from my run:

- Batch: `[ADD VERIFIED BATCH ID]`
- Required quality checks passed: `[ADD VERIFIED COUNT]`
- Revenue reconciliation difference: `[ADD VERIFIED DIFFERENCE]`
- Same-batch rerun duplicate difference: `[ADD VERIFIED RESULT]`

Next I am improving `[ADD REAL NEXT STEP]`.

File introduction — docs/demo_video_script.md

Exact filename: demo_video_script.md

Filename extension: .md. In this project it identifies project documentation and helps the correct application choose syntax highlighting or execution behavior.

Exact parent folder: docs relative to the repository root.

Why this file belongs there: Files with the same responsibility are grouped so a reviewer can find configuration, source SQL, transformations, tests, documentation, and report assets without guessing.

What the file will contain: project documentation for Phase 20.

Later dependencies: Later phase commands, tests, GitHub Actions, Databricks tasks, warehouse loads, Power BI work, or portfolio evidence may depend on its exact path.

Should Git track it? Yes, unless the lesson explicitly identifies it as generated data, a local secret, a log, or a machine-

specific artifact.

Could it contain secrets? It should not contain live passwords, tokens, connection strings, or account identifiers.

What happens if it is missing: The corresponding phase cannot be reproduced, validated, or explained from the repository alone.

VS Code click path

1. CLICK: In VS Code, open **Explorer** from the left Activity Bar.
2. LOOK FOR: Confirm the top-level folder name is SQL-Data-Warehouse-Project and the status bar shows the intended Git branch.
3. CLICK: Expand each parent folder in docs one level at a time.
4. If a parent folder does not exist, use the folder tutorial in this phase before creating the file.
5. RIGHT-CLICK: Right-click the immediate parent folder.
6. CLICK: Select **New File**.
7. TYPE THIS: demo_video_script.md.
8. PRESS: Enter.
9. LOOK FOR: A new editor tab labeled demo_video_script.md and an empty file under the correct parent folder.
10. PRESS: Ctrl+S after adding each explained section.

PowerShell path

Action 20.F5.1 — Create the file docs/demo_video_script.md from PowerShell

Application:

Windows PowerShell or the VS Code PowerShell terminal

Window or panel:

VS Code integrated PowerShell terminal opened at the repository root

Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

Current folder or location:

The repository root C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username.

What you are about to do:

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

Exact physical actions:

1. CLICK: Bring **Windows PowerShell or the VS Code PowerShell terminal** to the front.
2. LOOK FOR: Confirm the current location matches The repository root C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

Command or code (PowerShell):

```
New-Item -ItemType File -Path ".\docs\demo_video_script.md" -ErrorAction Stop
```

Where to enter it:

VS Code integrated PowerShell terminal opened at the repository root. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

What each part means:

- **Line 1:** `New-Item -ItemType File -Path ".\docs\demo_video_script.md" -ErrorAction Stop` — `New-Item` creates a file or folder; `-ItemType` is a command option or flag; its exact behavior is defined beside the command; `File` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `-Path` is a command option or flag; its exact behavior is defined beside the command; `".\docs\demo_video_script.md"` is a path, relative location, branch-style name, or file argument; verify every character before running it; `-ErrorAction` is a command option or flag; its exact behavior is defined beside the command; `Stop` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation

Does it change anything?

This can change files, Git state, packages, database objects, or data.

Is it safe to rerun?

Safe to rerun only after reading the idempotency note and confirming that the same batch, file, or object will not be duplicated.

What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

Do not continue unless:

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

Common mistake:

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

Exact recovery:

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

What you just accomplished:

You executed and checked one controlled operation rather than treating a long script as a black box.

How this connects to the project:

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 20 lesson index](#)

File-creation decision branches**If the command creates the file**

Run `Test-Path -LiteralPath ".\docs\demo_video_script.md" -PathType Leaf`. Continue only when it returns `True` and the file is empty because you just created it.

If PowerShell says the file already exists

Do not add -Force, do not clear the file, and do not overwrite it. Open the existing file in VS Code, run `git status --short -- "docs/demo_video_script.md"`, inspect its contents and Git history, and decide whether this lesson should edit the preserved file rather than create a new one.

If PowerShell says part of the path does not exist

Stop. Create only the missing parent folder through the earlier folder tutorial, verify it with `Test-Path -PathType Container`, and rerun this one file command.

File-content construction

1. Start with the smallest header, comment, or first section shown in the phase lesson.
2. Read the purpose before typing the section.
3. Add one logical section at a time.
4. Save with Ctrl+S.
5. Run the syntax or content validation named in the phase.
6. Correct the first error before adding another section.
7. Use `TODO(USER)` where the workbook requires your own decision or verified value.

File verification

1. In the VS Code Explorer, confirm the file appears under docs.
2. Right-click the editor tab and choose **Copy Path**; compare the ending with `docs/demo_video_script.md`.
3. In PowerShell at the repository root, run `Test-Path ".\docs\demo_video_script.md"` and require True.
4. Run `git status --short -- "docs/demo_video_script.md"` to see only this file's Git state.
5. Run the phase-specific validator before committing.

Optional reference answer for docs/demo_video_script.md

Attempt the file construction first. This reference is learning material, not evidence that you created or ran the file.

Language: Markdown

Exact file: `docs/demo_video_script.md`

Purpose: project documentation.

Inputs: The requirements, configuration, source data, or upstream objects described in Phase 20.

Expected outputs: The file's declared objects, logs, tables, checks, or documentation when the user later runs or reads it.

```
# Demo Video Script

## 0:00-0:30 – Business problem

“Northstar Retail is a fictional omnichannel retailer whose ERP, website, marketing, shipment, return, and inventory data disagree across systems. My goal was to produce trusted daily metrics with evidence from source through dashboard.”

Show: README business problem and overall architecture. Do not show credentials.

## 0:30-1:30 – Sources and synthetic data

Show SQL Server and PostgreSQL ERDs, then the generator command and sample manifest. Explain fixed seed, scale settings, realistic dependencies, and controlled defects. Show one expected issue fixture and one relevant source row.

## 1:30-2:30 – Lakehouse and workflow

Show Bronze/Silver/Gold contracts and the Lakeflow Job graph. Explain the manual Track A boundary and why localhost is not reachable. Open one Silver notebook and one quarantine rule.

## 2:30-3:30 – Dimensional model and SCD2

Show the star schema and SCD2 timeline. State fact_sales grain in one sentence. Show the current/expired customer versions from your verified run.

## 3:30-4:30 – Quality and publication

Show the test-results table and one failed-then-fixed story. Show Gold export manifest, SQL Server audit row, and revenue reconciliation. Use real batch values only.

## 4:30-5:30 – Power BI and conclusion

Show Model view, date table, measure folder, Executive Overview, and Data Quality page. Put SQL validation next to one KPI. Conclude with limitations and the next extension.

## Recording checklist

- Crop or blur account email, paths, server identifiers, tokens, and passwords.
- Zoom so text is readable.
```

- Keep batch ID visible where it proves lineage.
- Do not claim portfolio-scale timing unless measured.
- Keep the GitHub README open at the final project link.

- **Line 30:** blank line used only to separate logical sections for readability.
- **Line 31:** - Crop or blur account email, paths, server identifiers, tokens, and passwords. — - is a command option or flag; its exact behavior is defined beside the command; Crop is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; or is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; blur is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; account is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; email is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; , is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; paths is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; , is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; server is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; identifiers is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; , is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; remaining punctuation and identifiers continue the same statement.
- **Line 32:** - Zoom so text is readable. — - is a command option or flag; its exact behavior is defined beside the command; Zoom is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; so is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; text is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; is is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; readable is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; . is a path, relative location, branch-style name, or file argument; verify every character before running it
- **Line 33:** - Keep batch ID visible where it proves lineage. — - is a command option or flag; its exact behavior is defined beside the command; Keep is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; batch is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; ID is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; visible is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; where is a name, keyword, argument,

identifier, or literal whose project-specific role is described in the surrounding explanation; it is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; proves is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; lineage is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; . is a path, relative location, branch-style name, or file argument; verify every character before running it

- **Line 34:** - Do not claim portfolio-scale timing unless measured. — - is a command option or flag; its exact behavior is defined beside the command; Do is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; not is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; claim is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; portfolio-scale is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; timing is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; unless is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; measured is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; . is a path, relative location, branch-style name, or file argument; verify every character before running it
- **Line 35:** - Keep the GitHub README open at the final project link. — - is a command option or flag; its exact behavior is defined beside the command; Keep is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; the is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; GitHub is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; README is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; open is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; at is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; the is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; final is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; project is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; link is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; . is a path, relative location, branch-style name, or file argument; verify every character before running it

[Back to the Phase 20 lesson index](#)

What your screen should look like now

- Every Phase 20 file you actually created appears under the correct parent folder.
- Your open editor tab matches the file you are validating.
- The Git branch has not changed unexpectedly.
- `git status --short` lists only expected work.
- Reference answers remain reference material; your status fields are not automatically completed.

Lesson 20.3 completion checklist

☐

README.md was created by me, saved, located correctly, and inspected — [STATUS]

☐

docs/claim_to_evidence_map.md was created by me, saved, located correctly, and inspected — [STATUS]

☐

docs/resume_bullets.md was created by me, saved, located correctly, and inspected — [STATUS]

☐

docs/linkedin_post.md was created by me, saved, located correctly, and inspected — [STATUS]

☐

docs/demo_video_script.md was created by me, saved, located correctly, and inspected — [STATUS]

Safe stopping point

Save every open file with Ctrl+S. You may close VS Code only after `git status --short` is recorded in your journal. The terminal may be closed when no installer, transaction, Python process, Databricks run, warehouse load, or Power BI refresh is active. Resume at [Lesson 20.4](#) and recheck the root and branch.

Lesson 20.4 — Build and validate required objects

What your screen should look like before starting

The phase files are saved, the correct application and connection are visible, and the upstream input has passed its verification gate. Build one object at a time; do not create many objects and inspect them only at the end.

Action 20.4.G1 — Inspect the current state without changing it

Application:

VS Code Markdown Preview

Window or panel:

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

Starting condition:

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

Current folder or location:

The repository root C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username.

What you are about to do:

Inspect the current state without changing it. This is one bounded construction or inspection task.

Why this action comes now:

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

Exact physical actions:

1. Record the exact starting folders, branch, versions, connections, settings, counts, or evidence.
2. Inspect the result.
3. Record the actual value.
4. Continue only after verification.

Command or code:

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

Where to enter it:

VS Code Markdown Preview. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

What each part means:

1. Record the exact starting folders, branch, versions, connections, settings, counts, or evidence.
2. Inspect the result.
3. Record the actual value.
4. Continue only after verification.

What should happen:

A visible file, folder, branch, connection, table, notebook, task, relationship, measure, visual, or verification result should appear exactly where the action predicts.

Expected example:

Your exact values may differ. The expected result is the same *type* of object and the same required status, not necessarily the same timestamps, row counts, colors, generated IDs, or screen dimensions.

What may look different:

Menu wording can vary by product release or account tier. Use the official-source register and look for the described object rather than guessing from an old screenshot.

How to verify success:

Reopen or refresh the relevant panel, locate the named object, and inspect the property or output that proves it exists and is in the intended location.

Do not continue unless:

You can point to the visible result and explain what it proves. Mark the action VERIFIED BY USER only after that check.

Common mistake:

Combining several clicks or decisions, choosing a similarly named object, or continuing because no error dialog appeared.

Exact recovery:

Stop at the current screen. Save a screenshot of the error if useful, hide sensitive values, and compare the selected location with the starting condition. Use Back or Cancel rather than Delete or Overwrite. Correct one mismatch and repeat only this action.

What you just accomplished:

You completed one observable piece of the Northstar Retail platform and established a checkpoint that can be audited later.

How this connects to the project:

The resulting object, decision, or evidence becomes an input to the next stage in the source-to-consumption chain.

[Back to the Phase 20 lesson index](#)

Action 20.4.G2 — Create the smallest required object or decision

Application:

Visual Studio Code

Window or panel:

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

Starting condition:

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

Current folder or location:

The repository root C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username.

What you are about to do:

Create the smallest required object or decision. This is one bounded construction or inspection task.

Why this action comes now:

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

Exact physical actions:

1. Use the phase file tutorial and one bounded action card.
2. Inspect the result.
3. Record the actual value.
4. Continue only after verification.

Command or code:

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

Where to enter it:

Visual Studio Code. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

What each part means:

1. Use the phase file tutorial and one bounded action card.
2. Inspect the result.
3. Record the actual value.
4. Continue only after verification.

What should happen:

A visible file, folder, branch, connection, table, notebook, task, relationship, measure, visual, or verification result should appear exactly where the action predicts.

Expected example:

Your exact values may differ. The expected result is the same *type* of object and the same required status, not necessarily the same timestamps, row counts, colors, generated IDs, or screen dimensions.

What may look different:

Menu wording can vary by product release or account tier. Use the official-source register and look for the described object rather than guessing from an old screenshot.

How to verify success:

Reopen or refresh the relevant panel, locate the named object, and inspect the property or output that proves it exists and is in the intended location.

Do not continue unless:

You can point to the visible result and explain what it proves. Mark the action VERIFIED BY USER only after that check.

Common mistake:

Combining several clicks or decisions, choosing a similarly named object, or continuing because no error dialog appeared.

Exact recovery:

Stop at the current screen. Save a screenshot of the error if useful, hide sensitive values, and compare the selected location with the starting condition. Use Back or Cancel rather than Delete or Overwrite. Correct one mismatch and repeat only this action.

What you just accomplished:

You completed one observable piece of the Northstar Retail platform and established a checkpoint that can be audited later.

How this connects to the project:

The resulting object, decision, or evidence becomes an input to the next stage in the source-to-consumption chain.

[Back to the Phase 20 lesson index](#)

Action 20.4.G3 — Run the phase-specific verification

Application:

VS Code Markdown Preview

Window or panel:

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

Starting condition:

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

Current folder or location:

The repository root C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username.

What you are about to do:

Run the phase-specific verification. This is one bounded construction or inspection task.

Why this action comes now:

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

Exact physical actions:

1. Compare actual output with the required condition and record differences.
2. Inspect the result.
3. Record the actual value.
4. Continue only after verification.

Command or code:

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

Where to enter it:

VS Code Markdown Preview. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

What each part means:

1. Compare actual output with the required condition and record differences.
2. Inspect the result.
3. Record the actual value.
4. Continue only after verification.

What should happen:

A visible file, folder, branch, connection, table, notebook, task, relationship, measure, visual, or verification result should appear exactly where the action predicts.

Expected example:

Your exact values may differ. The expected result is the same *type* of object and the same required status, not necessarily the same timestamps, row counts, colors, generated IDs, or screen dimensions.

What may look different:

Menu wording can vary by product release or account tier. Use the official-source register and look for the described object rather than guessing from an old screenshot.

How to verify success:

Reopen or refresh the relevant panel, locate the named object, and inspect the property or output that proves it exists and is in the intended location.

Do not continue unless:

You can point to the visible result and explain what it proves. Mark the action VERIFIED BY USER only after that check.

Common mistake:

Combining several clicks or decisions, choosing a similarly named object, or continuing because no error dialog appeared.

Exact recovery:

Stop at the current screen. Save a screenshot of the error if useful, hide sensitive values, and compare the selected location with the starting condition. Use Back or Cancel rather than Delete or Overwrite. Correct one mismatch and repeat only this action.

What you just accomplished:

You completed one observable piece of the Northstar Retail platform and established a checkpoint that can be audited later.

How this connects to the project:

The resulting object, decision, or evidence becomes an input to the next stage in the source-to-consumption chain.

[Back to the Phase 20 lesson index](#)

Action 20.4.G4 — Demonstrate one safe failure or alternate-result branch

Application:

VS Code Markdown Preview

Window or panel:

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

Starting condition:

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

Current folder or location:

The repository root C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username.

What you are about to do:

Demonstrate one safe failure or alternate-result branch. This is one bounded construction or inspection task.

Why this action comes now:

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

Exact physical actions:

1. Use a toy/disposable case and prove recovery without damaging verified work.
2. Inspect the result.
3. Record the actual value.
4. Continue only after verification.

Command or code:

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

Where to enter it:

VS Code Markdown Preview. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

What each part means:

1. Use a toy/disposable case and prove recovery without damaging verified work.
2. Inspect the result.
3. Record the actual value.
4. Continue only after verification.

What should happen:

A visible file, folder, branch, connection, table, notebook, task, relationship, measure, visual, or verification result should appear exactly where the action predicts.

Expected example:

Your exact values may differ. The expected result is the same *type* of object and the same required status, not necessarily the same timestamps, row counts, colors, generated IDs, or screen dimensions.

What may look different:

Menu wording can vary by product release or account tier. Use the official-source register and look for the described object rather than guessing from an old screenshot.

How to verify success:

Reopen or refresh the relevant panel, locate the named object, and inspect the property or output that proves it exists and is in the intended location.

Do not continue unless:

You can point to the visible result and explain what it proves. Mark the action VERIFIED BY USER only after that check.

Common mistake:

Combining several clicks or decisions, choosing a similarly named object, or continuing because no error dialog appeared.

Exact recovery:

Stop at the current screen. Save a screenshot of the error if useful, hide sensitive values, and compare the selected location with the starting condition. Use Back or Cancel rather than Delete or Overwrite. Correct one mismatch and repeat only this action.

What you just accomplished:

You completed one observable piece of the Northstar Retail platform and established a checkpoint that can be audited later.

How this connects to the project:

The resulting object, decision, or evidence becomes an input to the next stage in the source-to-consumption chain.

[Back to the Phase 20 lesson index](#)

Action 20.4.G5 — Record evidence and prepare the downstream handoff

Application:

VS Code Markdown Preview

Window or panel:

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

Starting condition:

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

Current folder or location:

The repository root C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username.

What you are about to do:

Record evidence and prepare the downstream handoff. This is one bounded construction or inspection task.

Why this action comes now:

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

Exact physical actions:

1. Save the verified input that the next phase consumes.
2. Inspect the result.
3. Record the actual value.
4. Continue only after verification.

Command or code:

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

Where to enter it:

VS Code Markdown Preview. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

What each part means:

1. Save the verified input that the next phase consumes.
2. Inspect the result.
3. Record the actual value.
4. Continue only after verification.

What should happen:

A visible file, folder, branch, connection, table, notebook, task, relationship, measure, visual, or verification result should appear exactly where the action predicts.

Expected example:

Your exact values may differ. The expected result is the same *type* of object and the same required status, not necessarily the same timestamps, row counts, colors, generated IDs, or screen dimensions.

What may look different:

Menu wording can vary by product release or account tier. Use the official-source register and look for the described object rather than guessing from an old screenshot.

How to verify success:

Reopen or refresh the relevant panel, locate the named object, and inspect the property or output that proves it exists and is in the intended location.

Do not continue unless:

You can point to the visible result and explain what it proves. Mark the action VERIFIED BY USER only after that check.

Common mistake:

Combining several clicks or decisions, choosing a similarly named object, or continuing because no error dialog appeared.

Exact recovery:

Stop at the current screen. Save a screenshot of the error if useful, hide sensitive values, and compare the selected location with the starting condition. Use Back or Cancel rather than Delete or Overwrite. Correct one mismatch and repeat only this action.

What you just accomplished:

You completed one observable piece of the Northstar Retail platform and established a checkpoint that can be audited later.

How this connects to the project:

The resulting object, decision, or evidence becomes an input to the next stage in the source-to-consumption chain.

What your screen should look like now

- The new Phase 20 objects are visible in their owning application.
- The current branch remains the intended feature branch.
- The current database, catalog, schema, Power BI model, or GitHub run is still identifiable.
- Verification output is visible or recorded; no object is marked complete solely because creation code was displayed.
- Any failed toy demonstration has been repaired or isolated.

Lesson 20.4 completion checklist

☐

Every required object was built separately — [STATUS]

☐

Every object has a declared responsibility/grain — [STATUS]

☐

Inputs and outputs were inspected — [STATUS]

☐

A rerun or alternate-result branch was tested where applicable — [STATUS]

☐

Counts, keys, measures, relationships, or settings were independently validated — [STATUS]

☐

I can explain one failure and its safest recovery — [STATUS]

Safe stopping point

Stop only after the active command, database transaction, Databricks cell/Job, Python process, warehouse load, or Power BI refresh finishes. Save all files and the Power BI project. Record uncommitted Git changes and exact resume action. Resume at [Lesson 20.5](#).

Lesson 20.5 — Verify, troubleshoot, commit, teach back, and stop safely

What your screen should look like before starting

The Phase 20 outputs are visible, all runs are finished, open files are saved, and you can state the active branch and execution context. Any error you encountered has a recorded message and has not been hidden by deleting evidence.

Design decision — Verification before automation

Question:

Should the phase prioritize a visible manual verification or jump directly to automation?

Options considered:

- Manual verification first, then automation.
- Automation without a known-good baseline.
- Manual operation forever.

Beginner path selected:

Establish one verified manual baseline and then automate repeatable checks.

Why this path was selected:

A known-good example makes failures interpretable and prevents automation from hiding a wrong assumption.

Tradeoff:

The first run takes longer.

What a company might do instead:

Teams often pair infrastructure as code and automated tests with controlled bootstrap and acceptance procedures.

How to explain this in an interview:

I established a verified baseline, then encoded the same contract in tests and orchestration so automation preserved meaning rather than just speed.

If you see Result A

GitHub renders the README, links, evidence, limitations, and verified claims correctly. Record the exact result, perform the named independent verification, and continue only when the gate is satisfied.

If you see Result B

A link/image is broken or a claim lacks execution evidence and must be softened or removed. Treat this as information, not permission to delete or overwrite. Follow the branch-specific diagnostic in the current action, preserve evidence, and continue only after the state is understood.

If you see an error

Read the first meaningful error line, redact secrets, and verify the application, path, branch, server/database, catalog/schema, batch ID, parameters, version/tier, and object name. Run the smallest observational check first. Do not reset Git history, drop data, disable a rule, force-push, or replace the target merely to make the error disappear.

Phase-specific verification gate

☐

Required files/objects exist in the exact location.

☐

I personally created or configured them.

☐

I ran the phase commands in the documented context.

☐

I inspected the output rather than relying on a green icon alone.

☐

Counts, keys, relationships, measures, checksums, statuses, or settings meet the declared contract.

☐

Same-batch/rerun behavior is known where applicable.

☐

A controlled failure or realistic alternate-result branch was tested safely where applicable.

☐

No password, token, or secret appears in tracked files, screenshots, notebook output, terminal history pasted into documentation, or staged changes.

☐

Actual verified result: [ENTER VERIFIED RESULT].

Point-of-failure troubleshooting record

Exact or representative error message:

[PASTE THE FIRST MEANINGFUL ERROR, WITH SECRETS REDACTED]

What it means in plain language:

[WRITE YOUR INTERPRETATION]

Most likely cause:

[WRITE ONE TESTABLE HYPOTHESIS]

What not to do:

Do not delete data, drop databases, reset Git history, force-push, disable constraints, edit raw evidence, change a quality threshold, or expose credentials merely to make the symptom disappear.

First diagnostic action:

[ENTER THE SMALLEST OBSERVATIONAL CHECK]

How to read the diagnostic result:

[RESULT A MEANS... / RESULT B MEANS...]

Safest fix:

[ENTER THE NARROW FIX]

Alternative fix when applicable:

[ENTER OR N/A]

How to verify the fix:

[ENTER THE INDEPENDENT RECHECK]

How to return to the main tutorial:

Resume at the exact action number that failed; do not skip its verification gate.

Screenshot checkpoint

Application(s) that should be visible: VS Code Markdown Preview, GitHub repository page, File Explorer, and image editor only for redaction/cropping.

Window/panel: Show GitHub README preview with verified screenshots, limitations, and evidence links.

Sensitive information to hide: Passwords, tokens, connection strings, email addresses, cloud account IDs, unnecessary Windows profile details, and any secret revealed by an error.

Include: The object name, batch/run ID when relevant, result/status, and enough surrounding UI to prove which application and layer is shown.

Crop out: Unrelated desktop windows, notification previews, bookmarks, chat, and empty background.

Recommended filename: docs/images/phase20_build-the-readme-evidence-package-and-portfolio-present_verified.png.

Recommended repository folder: docs/images/.

README placement: The section describing Phase 20's verified result; do not use the image before the result is actually verified.

What it proves: The visible state existed under the shown context. It does not prove hidden rows, other batches, every filter combination, or a later run.

[ADD YOUR VERIFIED SCREENSHOT HERE]

Git checkpoint after the verified Phase 20 changes

Do not use `git add .` until you understand that it stages every matching change under the current directory, including files you did not intend. Prefer targeted staging after inspecting status and diffs.

Save open work

1. PRESS: In VS Code, press Ctrl+K, then S if you use **Save All**, or press Ctrl+S in every modified editor.
2. In Power BI, press Ctrl+S and confirm the local file location.
3. Wait for database, Python, Databricks, and refresh operations to finish; Git does not capture uncommitted database/cloud state.

Action 20.5.G1 — Verify the repository root before Git operations

Application:

Windows PowerShell or the VS Code PowerShell terminal

Window or panel:

VS Code integrated PowerShell terminal

Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

Current folder or location:

The repository root C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username.

What you are about to do:

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

Exact physical actions:

1. CLICK: Bring **Windows PowerShell or the VS Code PowerShell terminal** to the front.
2. LOOK FOR: Confirm the current location matches The repository root C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

Command or code (PowerShell):

```
git rev-parse --show-toplevel
```

Where to enter it:

VS Code integrated PowerShell terminal. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

What each part means:

- **Line 1:** `git rev-parse --show-toplevel` — `git` calls the Git version-control program; `rev-parse` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `--show` is a command option or flag; its exact behavior is defined beside the command; `-toplevel` is a command option or flag; its exact behavior is defined beside the command

Does it change anything?

This is intended to inspect or validate state rather than change it.

Is it safe to rerun?

Normally safe to rerun because it is observational, but still confirm the execution location first.

What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

Do not continue unless:

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

Common mistake:

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

Exact recovery:

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

What you just accomplished:

You executed and checked one controlled operation rather than treating a long script as a black box.

How this connects to the project:

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 20 lesson index](#)

Action 20.5.G2 — Verify the active Git branch

Application:

Windows PowerShell or the VS Code PowerShell terminal

Window or panel:

VS Code integrated PowerShell terminal

Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

Current folder or location:

The repository root C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username.

What you are about to do:

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

Exact physical actions:

1. CLICK: Bring **Windows PowerShell or the VS Code PowerShell terminal** to the front.
2. LOOK FOR: Confirm the current location matches The repository root C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

Command or code (PowerShell):

```
git branch --show-current
```

Where to enter it:

VS Code integrated PowerShell terminal. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

What each part means:

- **Line 1:** `git branch --show-current` — `git` calls the Git version-control program; `branch` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `--show` is a command option or flag; its exact behavior is defined beside the command; `-current` is a command option or flag; its exact behavior is defined beside the command

Does it change anything?

This is intended to inspect or validate state rather than change it.

Is it safe to rerun?

Normally safe to rerun because it is observational, but still confirm the execution location first.

What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

Do not continue unless:

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

Common mistake:

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

Exact recovery:

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

What you just accomplished:

You executed and checked one controlled operation rather than treating a long script as a black box.

How this connects to the project:

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 20 lesson index](#)

Action 20.5.G3 — Inspect all current Git changes

Application:

Windows PowerShell or the VS Code PowerShell terminal

Window or panel:

VS Code integrated PowerShell terminal

Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

Current folder or location:

The repository root `C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project`. The User segment is an example; verify your real Windows username.

What you are about to do:

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

Exact physical actions:

1. CLICK: Bring **Windows PowerShell or the VS Code PowerShell terminal** to the front.
2. LOOK FOR: Confirm the current location matches The repository root `C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project`. The User segment is an example; verify your real Windows username. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

Command or code (PowerShell):

```
git status --short
```

Where to enter it:

VS Code integrated PowerShell terminal. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

What each part means:

- **Line 1:** `git status --short` — `git` calls the Git version-control program; `status` shows tracked, staged, modified, and untracked work; `--short` is a command option or flag; its exact behavior is defined beside the command

Does it change anything?

This is intended to inspect or validate state rather than change it.

Is it safe to rerun?

Normally safe to rerun because it is observational, but still confirm the execution location first.

What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

Do not continue unless:

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

Common mistake:

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

Exact recovery:

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

What you just accomplished:

You executed and checked one controlled operation rather than treating a long script as a black box.

How this connects to the project:

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 20 lesson index](#)

Interpret git status --short

- ?? means untracked: Git sees a new path but it is not staged.
- M means modified in the working tree but not staged.
- M means the staged version differs from the last commit.
- MM means a staged version exists and the file has additional unstaged edits.
- A means staged as a new file.
- D means deletion; stop and investigate unless deletion is deliberate.
- R means rename; inspect both old and new paths.
- A blank result means the working tree is clean. It does not prove database, Databricks, or Power BI work occurred.

Action 20.5.G4 — Inspect the unstaged diff for README.md

Application:

Windows PowerShell or the VS Code PowerShell terminal

Window or panel:

VS Code integrated PowerShell terminal

Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

Current folder or location:

The repository root C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username.

What you are about to do:

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

Exact physical actions:

1. CLICK: Bring **Windows PowerShell or the VS Code PowerShell terminal** to the front.
2. LOOK FOR: Confirm the current location matches The repository root C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

Command or code (PowerShell):

```
git diff -- "README.md"
```

Where to enter it:

VS Code integrated PowerShell terminal. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

What each part means:

- **Line 1:** `git diff -- "README.md"` — `git` calls the Git version-control program; `diff` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `--` is a command option or flag; its exact behavior is defined beside the command; `"README.md"` is a quoted literal; the quotation marks preserve spaces or mark text

Does it change anything?

This is intended to inspect or validate state rather than change it.

Is it safe to rerun?

Normally safe to rerun because it is observational, but still confirm the execution location first.

What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

Do not continue unless:

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

Common mistake:

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

Exact recovery:

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

What you just accomplished:

You executed and checked one controlled operation rather than treating a long script as a black box.

How this connects to the project:

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 20 lesson index](#)

Action 20.5.G5 — Stage only the reviewed file README.md

Application:

Windows PowerShell or the VS Code PowerShell terminal

Window or panel:

VS Code integrated PowerShell terminal

Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

Current folder or location:

The repository root C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username.

What you are about to do:

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

Exact physical actions:

1. CLICK: Bring **Windows PowerShell or the VS Code PowerShell terminal** to the front.
2. LOOK FOR: Confirm the current location matches The repository root C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

Command or code (PowerShell):

```
git add -- "README.md"
```

Where to enter it:

VS Code integrated PowerShell terminal. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

What each part means:

- **Line 1:** `git add -- "README.md"` — `git` calls the Git version-control program; `add` moves selected changes into the staging area; `--` is a command option or flag; its exact behavior is defined beside the command; `"README.md"` is a quoted literal; the quotation marks preserve spaces or mark text

Does it change anything?

This can change files, Git state, packages, database objects, or data.

Is it safe to rerun?

Safe to rerun only after reading the idempotency note and confirming that the same batch, file, or object will not be duplicated.

What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row

count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use Get-Location or Test-Path; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

Do not continue unless:

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

Common mistake:

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

Exact recovery:

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

What you just accomplished:

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 20 lesson index](#)

For every additional intended path, run a separate targeted `git add -- "path"` after its diff is reviewed. Never stage `.env`, generated raw batches, credentials, tokens, local database files, or an unverified Power BI artifact.

Action 20.5.G6 — Inspect the staged diff

Application:

Windows PowerShell or the VS Code PowerShell terminal

Window or panel:

VS Code integrated PowerShell terminal

Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

Current folder or location:

The repository root `C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project`. The User segment is an example; verify your real Windows username.

What you are about to do:

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

Exact physical actions:

1. CLICK: Bring **Windows PowerShell or the VS Code PowerShell terminal** to the front.
2. LOOK FOR: Confirm the current location matches The repository root `C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project`. The User segment is an example; verify your real Windows username. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

Command or code (PowerShell):

```
git diff --cached
```

Where to enter it:

VS Code integrated PowerShell terminal. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

What each part means:

- **Line 1:** `git diff --cached` — `git` calls the Git version-control program; `diff` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `--cached` is a command option or flag; its exact behavior is defined beside the command

Does it change anything?

This is intended to inspect or validate state rather than change it.

Is it safe to rerun?

Normally safe to rerun because it is observational, but still confirm the execution location first.

What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

Do not continue unless:

Action 20.5.G7 — Create the Phase 20 commit

Application:

Windows PowerShell or the VS Code PowerShell terminal

Window or panel:

VS Code integrated PowerShell terminal

Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

Current folder or location:

The repository root C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username.

What you are about to do:

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

Exact physical actions:

1. CLICK: Bring **Windows PowerShell or the VS Code PowerShell terminal** to the front.
2. LOOK FOR: Confirm the current location matches The repository root C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

Command or code (PowerShell):

```
git commit -m "docs: publish verified portfolio evidence"
```

Where to enter it:

VS Code integrated PowerShell terminal. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

What each part means:

- **Line 1:** `git commit -m "docs: publish verified portfolio evidence"` — `git` calls the Git version-control program; `commit` records the staged snapshot; `-m` asks Python to run an installed module; `"docs: publish verified portfolio evidence"` is a quoted literal; the quotation marks preserve spaces or mark text

Does it change anything?

This can change files, Git state, packages, database objects, or data.

Is it safe to rerun?

Safe to rerun only after reading the idempotency note and confirming that the same batch, file, or object will not be duplicated.

What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row

count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use Get-Location or Test-Path; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

Do not continue unless:

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

Common mistake:

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

Exact recovery:

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

What you just accomplished:

You executed and checked one controlled operation rather than treating a long script as a black box.

How this connects to the project:

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 20 lesson index](#)

Action 20.5.G8 — Verify the new commit

Application:

Windows PowerShell or the VS Code PowerShell terminal

Window or panel:

VS Code integrated PowerShell terminal

Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

Current folder or location:

The repository root `C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project`. The User segment is an example; verify your real Windows username.

What you are about to do:

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

Exact physical actions:

1. CLICK: Bring **Windows PowerShell or the VS Code PowerShell terminal** to the front.
2. LOOK FOR: Confirm the current location matches The repository root `C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project`. The User segment is an example; verify your real Windows username. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

Command or code (PowerShell):

```
git log -1 --oneline --decorate
```

Where to enter it:

VS Code integrated PowerShell terminal. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

What each part means:

- **Line 1:** `git log -1 --oneline --decorate` — `git` calls the Git version-control program; `log` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `-1` is a command option or flag; its exact behavior is defined beside the command; `--oneline` is a command option or flag; its exact behavior is defined beside the command; `--decorate` is a command option or flag; its exact behavior is defined beside the command

Does it change anything?

This is intended to inspect or validate state rather than change it.

Is it safe to rerun?

Normally safe to rerun because it is observational, but still confirm the execution location first.

What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

Do not continue unless:

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

Common mistake:

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

Exact recovery:

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

What you just accomplished:

You executed and checked one controlled operation rather than treating a long script as a black box.

How this connects to the project:

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 20 lesson index](#)

Action 20.5.G9 — Push the feature branch and set upstream

Application:

Windows PowerShell or the VS Code PowerShell terminal

Window or panel:

VS Code integrated PowerShell terminal

Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

Current folder or location:

The repository root C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username.

What you are about to do:

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

Exact physical actions:

1. CLICK: Bring **Windows PowerShell or the VS Code PowerShell terminal** to the front.
2. LOOK FOR: Confirm the current location matches The repository root C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

Command or code (PowerShell):

```
git push -u origin "$(git branch --show-current)"
```

Where to enter it:

VS Code integrated PowerShell terminal. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

What each part means:

- **Line 1:** `git push -u origin "$(git branch --show-current)"` — `git` calls the Git version-control program; `push` sends local commits to a remote repository; `-u` is a command option or flag; its exact behavior is defined beside the command; `origin` the conventional name of the GitHub remote; `"$(git branch --show-current)"` is a quoted literal; the quotation marks preserve spaces or mark text

Does it change anything?

This can change files, Git state, packages, database objects, or data.

Is it safe to rerun?

Safe to rerun only after reading the idempotency note and confirming that the same batch, file, or object will not be duplicated.

What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

Do not continue unless:

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

Common mistake:

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

Exact recovery:

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

What you just accomplished:

You executed and checked one controlled operation rather than treating a long script as a black box.

How this connects to the project:

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 20 lesson index](#)

Verify on GitHub

1. CLICK: Open the repository page in a browser.
2. CLICK: Open the branch selector above the file list.
3. TYPE THIS: The exact branch name returned locally.
4. CLICK: Select that branch.
5. LOOK FOR: The latest commit message docs: publish verified portfolio evidence and the intended changed paths.
6. CLICK: Open each changed file and confirm the GitHub version matches the staged diff.
7. Do not merge solely because the push succeeded; CI and review must pass.

Push-rejected recovery

If Git says the remote contains work you do not have, do not use `--force`. Run `git fetch origin`, inspect `git log --oneline --graph --decorate --all -20`, then rebase or merge only after understanding the divergence. Resolve conflicts one file at a time, run tests again, and push normally. A rejection protects remote work; it is not permission to overwrite it.

Explain it in your own words

Without copying the model answer, explain:

1. What you created or configured in Phase 20.
2. Why it exists.
3. Where it is located on your computer, in a database, in Databricks, in Power BI, or on GitHub.
4. What information enters it.
5. What information leaves it.
6. How it connects to the next phase.
7. How you verified it.
8. What could cause it to fail.
9. Which decision/tradeoff you could defend in an interview.

My answer

[WRITE YOUR ANSWER BEFORE READING THE REFERENCE]

OPTIONAL REFERENCE ANSWER — PHASE 20 TEACH-BACK MODEL

Read this only after completing **MY TASK** and using the three hints in order. The model is a learning reference, not evidence of your execution.

"Phase 20 created the verified boundary described by **Build the README, evidence package, and portfolio presentation**. It consumes only the outputs accepted from earlier phases, produces a named and auditable handoff, and records enough metadata and tests to detect wrong context, missing data, duplicates, failed rules, or unsafe reruns. I verified the result in its owning application and connected the evidence to Git without claiming that displayed instructions were executed."

Mini quiz

1. Multiple choice: Why does Phase 20 occur at this point in the source-to-consumption chain? A) Because menu order is arbitrary. B) Because its verified upstream input now exists. C) Because later phases do not depend on it. D) To create portfolio screenshots before validation.
 2. True or false: A command that displays no error is automatically verified even when it ran in the wrong folder, database, catalog, schema, branch, or filter context.
 3. Fill in the blank: The statement that defines what one row represents is the table or entity _____.
 4. What command would you use first to confirm the PowerShell current folder before a repository command?
 5. Troubleshooting: Your output differs from the example. What should you check before deleting, overwriting, resetting, force-pushing, or weakening a test?
 6. Design choice: Explain one tradeoff of Track A and one production alternative.
 7. Code reading: Why are input, accepted, rejected, and deduplicated counts recorded separately?
 8. Ownership: Which status may you select only after personally performing and inspecting the verification?
-

Mini quiz answer key and explanations

1. **B.** This phase is ordered after its prerequisites so its output has a trustworthy input. A is wrong because order is intentional; C is wrong because later phases depend on the handoff; D is wrong because screenshots follow verification.
2. **False.** Lack of an error proves only that the application accepted something; context and independent verification still matter.
3. **Grain.** Grain is the precise meaning of one row. A key identifies a row, but it does not by itself state the row's business meaning.
4. **Get-Location.** It shows the shell's current folder. `git rev-parse --show-toplevel` separately verifies the repository root when inside a clone.
5. Check application, folder/path, branch, server/database, catalog/schema, batch ID, parameters, source/target grain, filter context, version/tier differences, and the first meaningful error. Destructive changes are not a diagnostic step.
6. Track A has manual upload/download boundaries and batch latency. A production alternative is routable private connectivity with cloud object storage/managed warehouse, identities, and automated orchestration.
7. Separate counts make every row outcome explainable. A single final count can hide silent drops, duplicates, or records that moved to quarantine.
8. **Verified by me / VERIFIED BY USER.** `PLANNED`, `CREATED BY USER`, and `RUN BY USER` describe earlier states; only inspected evidence supports verification.

[WRITE YOUR ANSWER]

What I still need to practice:

[WRITE YOUR ANSWER]

What your screen should look like now

- The phase output and final validation are saved or visible.
- The intended feature branch is still active.
- `git status` is either clean after the commit or lists only deliberately deferred work recorded in the journal.
- The branch exists on GitHub after a successful push.
- No database transaction, Databricks run, loader, test process, or Power BI refresh is still active.
- The next phase's required input is identifiable.

Lesson 20.5 completion checklist

☐

I completed the verification gate with my actual results — [STATUS]

☐

I recorded at least one realistic failure, alternate result, or diagnostic path — [STATUS]

☐

I captured and redacted the required screenshot only after verification — [STATUS]

☐

I reviewed, staged, committed, pushed, and verified only the intended Git changes — [STATUS]

☐

I completed the teach-back, quiz, answer review, and learning journal — [STATUS]

☐

I can name the exact verified handoff to the next phase — [STATUS]

Safe stopping point

All files must be saved. The terminal may be closed after the Git result is recorded. SSMS/pgAdmin may be closed after queries finish and transactions are committed/rolled back. Databricks compute may be stopped when no Job or notebook is running. Power BI may be closed after saving. Resume from the next phase's screen-start checklist and re-verify root, branch, connection, and latest accepted batch.

How this phase connects to the next phase

Phase 21 turns the real project into truthful interview explanations.

Phase 20 completion checklist

☐

Phase goal explained in my own words — [STATUS]

☐

Required files/objects created by me — [STATUS]

☐

Commands run by me — [STATUS]

☐

Output independently inspected — [STATUS]

☐

Failure/alternate branch understood — [STATUS]

☐

Screenshot captured and redacted — [STATUS]

☐

Targeted Git commit exists — [STATUS]

☐

Branch pushed and verified on GitHub — [STATUS]

☐

Quiz completed before answer key — [STATUS]

☐

Journal completed — [STATUS]

☐

Final phase status manually set — [] Not started / [-] In progress / [x] Verified by me / [!] Needs troubleshooting

[Back to the master table of contents](#)

Phase 21 — Prepare interview explanations and defend every design choice

[Back to the master table of contents](#)

Track: Track A required

Status when first opened: PLANNED

Completion rule: The phase is not complete because its instructions exist. Mark it VERIFIED BY USER only after you perform the work, inspect the output, and save evidence.

Why this phase happens now

Earlier work this phase depends on: A completed claim-to-evidence map and defensible decisions.

What would go wrong if it happened earlier: You would create objects without a verified requirement, valid upstream input, protected repository state, or known execution environment.

Later work that depends on it: Phase 22 evaluates advanced alternatives only after the required path is stable.

Decision being made: Choose and verify the simplest local-first method that teaches the professional concept without pretending that local services are publicly reachable.

Alternatives: A company could use managed cloud databases, infrastructure as code, service principals, direct JDBC publication, deployment bundles, or streaming. Those options are discussed as tradeoffs, not substituted silently.

Beginner path selected: Track A: local SQL Server and PostgreSQL, Python batch extracts, manual governed upload to Databricks, Delta Bronze/Silver/Gold, manual verified export, local SQL Server warehouse, and Power BI Import.

Reason for the order: Requirements become source decisions; sources become generated data; source data becomes extraction batches; batches become Bronze; Bronze becomes Silver; Silver becomes Gold; Gold becomes warehouse and Power BI input.

Phase 21 lesson index

1. [Lesson 21.1 — Understand the phase and starting screen](#)
2. [Lesson 21.2 — Perform the notebook-guided actions one at a time](#)
3. [Lesson 21.3 — Create and understand the phase files](#)
4. [Lesson 21.4 — Build and validate required objects](#)
5. [Lesson 21.5 — Verify, troubleshoot, commit, teach back, and stop safely](#)

Lesson 21.1 — Understand the phase and starting screen

What your screen should look like before starting

- **Application open:** VS Code, the completed workbook journal, repository evidence, and a timer.
- **Window in front:** The application named by the first action; do not keep an installer, database editor, notebook, and Power BI dialog stacked ambiguously.
- **Repository folder:** C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project when repository work is required. Verify User on your computer.
- **Git branch:** A feature branch, not a detached commit. Run `git branch --show-current` and record the exact result.
- **Database/workspace connection:** The connection named in the action, not merely the most recent connection.
- **Files that should already exist:** Only files from verified earlier phases. Do not pre-create the full tree.
- **Files that should not exist yet:** New Phase 21 files remain absent until their creation lesson.
- **Terminal prompt:** It should end in the expected repository path or another explicitly named folder.
- **Previous verification:** Phase 20 must be verified when this phase has a prerequisite.

Three-level explanation of the phase

Level 1 — Child-simple explanation

Imagine building a store from labeled boxes. This phase handles one box, checks that the label is correct, and makes sure the next box receives the right thing. You do not pour all boxes together and hope the result is understandable.

Level 2 — Northstar Retail project explanation

Phase 21 creates the specific Northstar Retail files, database objects, transformations, tests, model objects, or evidence described in the lessons. Every output keeps a visible connection to its source and batch so you can trace an order, customer, product, campaign, return, shipment, or inventory record.

Level 3 — Professional explanation

This phase establishes a controlled boundary in an end-to-end batch platform. It defines contracts, execution context, idempotency behavior, quality expectations, evidence, and handoff artifacts so the downstream layer can be reproduced and reviewed independently.

Applications to open

VS Code, the completed workbook journal, repository evidence, and a timer. Open only the application needed for the immediate action. Extra windows increase the chance of typing a command into the wrong context.

Phase status gate

☐

I changed this phase from [] Not started to [-] In progress in the master tracker.

☐

I verified the repository root when repository work is required.

☐

I verified the current branch.

☐

I identified the exact server/database, Databricks workspace/catalog/schema, or Power BI file.

☐

I read the phase ordering explanation.

What your screen should look like now

- The Phase 21 lesson index, starting-screen checklist, and three explanation levels remain visible in this workbook.
- Only the applications required for the next lesson are open; no installer, database transaction, notebook run, or Power BI refresh was started merely to read orientation material.
- The intended repository path, active branch, server/database, Databricks workspace, or Power BI file has been written down when it applies.
- No new Phase 21 project file or object has been created yet unless the lesson explicitly instructed you to create it.
- The Phase 21 master-tracker row is marked [-] In progress only after you personally updated it.

Lesson 21.1 completion checklist

☐

I read why Phase 21 happens now — [STATUS]

☐

I can give the child-simple, Northstar-specific, and professional explanations — [STATUS]

☐

I identified the exact applications and execution context required next — [STATUS]

☐

I verified prerequisites instead of assuming they are complete — [STATUS]

☐

I updated the progress tracker myself — [STATUS]

Safe stopping point

No command, database transaction, Databricks run, loader, or Power BI refresh should be active after this orientation lesson. Save any journal note you created. You may close the workbook viewer and applications. When returning, reopen [Lesson 21.2](#), re-read its starting-screen checklist, and verify the repository root, branch, connection, and workspace before performing an action.

[Back to the Phase 21 lesson index](#)

Lesson 21.2 — Perform the notebook-guided actions one at a time

What your screen should look like before starting

The Phase 21 start gate is checked, only the needed application is in front, and the current context has been verified. The following retained lesson material preserves the Northstar terminology and exercise framing; the action cards then turn each hands-on step into a written screen-recording sequence.

Retained phase lesson, exercises, rules, and expected results

Track: Track A required

Ownership status at start: Workbook instructions exist; your execution is not yet verified.

Evidence rule: Replace placeholders only after the verification steps pass.

1. What you are building

A 30-second explanation, 2-minute story, 5-minute architecture walkthrough, 10-minute technical walkthrough, at least 40 interview questions with beginner-friendly answers and follow-ups, a design-defense worksheet, STAR troubleshooting template, glossary, and final self-assessment rubric.

2. Why it matters

A portfolio helps only when you can explain what happened, why each choice was made, what failed, what evidence proves correctness, and what you would change at greater scale.

3. Words to know

Term	Plain-language definition
Elevator pitch	A short problem-and-solution explanation for someone with limited time.
Tradeoff	A benefit gained while accepting a cost or limitation.
Design defense	Explaining the requirement, alternatives, decision, consequences, and evidence for a choice.
STAR	Situation, Task, Action, Result: a structured story format.
Teach-back	Explaining a concept in your own words to prove understanding.
Follow-up question	A deeper interviewer question that tests whether an answer was memorized or understood.
Scale thought experiment	Explaining what changes if volume, velocity, users, or reliability requirements increase.
Failure mode	A way the system can break and how it is detected/recovered.
Self-assessment rubric	A scored checklist of understanding, execution, evidence, and communication.

4. What must already be completed

You have completed or accurately status-labeled every project phase, recorded at least one real troubleshooting story, and can open the repository evidence during a walkthrough.

5. Applications to open

Application	How to open it	Why it is open
VS Code Markdown Preview	Open docs/interview_walkthrough.md and glossary.	Practice from prompts without changing evidence.
Timer/voice recorder	Use a local phone or desktop recorder.	Measure pacing and hear unclear explanations.
Repository/browser	Open README, diagrams, code, tests, screenshots.	Support answers with evidence rather than memory alone.
Learning journal	Open the learning-journal fields in this phase.	Select real failures and lessons for STAR stories.

6. Exact click-by-click steps

Beginner rhythm: Read the whole step. Confirm the application and location. Perform only that step. Verify the visible result. Record an error before attempting a fix.

7. Exact commands, one code block at a time

8. Where each command runs

Never infer the execution location from the code language. The command headings above identify the application and folder/database/catalog. Before every PowerShell command, run `Get-Location`; before SQL, verify the selected database; before Spark, print the catalog/schema/batch widgets.

TEACHING EXAMPLE

The following small example or reference pattern explains the concept before you attempt Northstar-specific work. Read it, then complete **MY TASK** without copying the answer.

Line-by-line code explanation

Line or action	Meaning	Why it belongs here
code .\docs\interview_walkthrough.md	Opens the interview guide and glossary in VS Code.	These are the practice source, not a script to read during an interview.
(Select-String -Path .\docs\interview_walkthrough.md -Pattern '^##[0-9]+.').Count	Counts the labeled interview questions.	The workbook requirement is at least 40.
Select-String -Path the learning-journal fields in this workbook -Pattern 'What broke How I diagnosed What I learned'	Locates the troubleshooting-story prompts.	STAR answers should come from your actual work.
Get-ChildItem .\docs\images*.svg Select-Object Name	Lists diagrams available for a live walkthrough.	You should know which visual supports each explanation.

Answer structure

Use: **requirement -> decision -> implementation -> validation -> tradeoff -> next-scale change**. Example: leadership needed consistent daily product metrics; a star schema was chosen for understandable BI; fact_sales uses one row per order item and surrogate dimension keys; grain/RI/revenue tests validate it; SCD2/history adds complexity; at 100x volume, incremental/partition/CDC and performance testing would become more important.

Honest uncertainty

When you did not execute an optional feature, say so, explain the designed extension, and distinguish what you know conceptually from evidence in this repository.

MY TASK

Record all four timed explanations, answer every in-workbook question aloud, complete the design-defense and STAR worksheets with your evidence, run a follow-up practice session, and score the self-assessment honestly.

STARTER SKELETON

```
DESIGN CHOICE: TODO(USER)
REQUIREMENT: TODO(USER)
ALTERNATIVES CONSIDERED: TODO(USER)
DECISION AND WHY: TODO(USER)
IMPLEMENTATION FILES: TODO(USER)
VALIDATION EVIDENCE: TODO(USER)
TRADEOFF/LIMITATION: TODO(USER)
WHAT CHANGES AT 100x: TODO(USER)
FOLLOW-UP I EXPECT: TODO(USER)
```

Acceptance criteria: Each timed version fits its limit and sounds natural; every major component/design choice can be explained without jargon-only answers; 40+ questions are attempted with evidence; one real STAR story is complete; limitations and 100x changes are defensible; rubric gaps become tasks.

HINT 1 — CONCEPT

Do not memorize paragraphs; memorize the architecture, grains, validations, and tradeoffs.

HINT 2 — PSEUDOCODE

For every answer, connect one requirement to one file/query/run and one limitation.

HINT 3 — NEAR-COMPLETE PATTERN

Use the in-workbook question bank, hide the answer, speak for 60–90 seconds, then compare and add your own verified example/follow-up.

13. Expected files or output

- Four timed recordings or practice notes.
- Attempt log for 40+ questions and follow-ups.
- Completed design-defense worksheets.
- At least one genuine STAR troubleshooting story.
- Glossary teach-back notes.
- Completed self-assessment rubric and learning tasks.

14. How to verify

- 30-second pitch states problem, solution, and honest status.
- 2-minute story covers full flow without drowning in tools.
- 5-minute architecture follows actual arrows/boundaries.
- 10-minute walkthrough includes dirty data, SCD2, grain, gate, and reconciliation evidence.
- Every metric/achievement statement can be traced to evidence.
- You can explain why SQL Server and PostgreSQL are separate and why dialects differ.
- You can state Track A manual limitations and Track B requirements.
- Rubric is not self-scored as complete without proof.

15. Automated tests

- Timed practice against limits.
- Random-question practice without reading answers.
- Follow-up interruption practice.
- Diagram teach-back.
- Evidence lookup under two minutes.
- Self-assessment scored with examples.

16. Common errors and exact fixes

Message/symptom	Likely cause	Exact diagnostic	Safe fix	Verify
Answer becomes a list of tools	The business requirement and data flow are missing.	Listen for a problem, decision, validation, and tradeoff.	Start with the stakeholder question; mention tools only where they solve a requirement.	A nontechnical listener can summarize the value.
Cannot state fact_sales grain	Model was memorized by table name rather than row meaning.	Open mapping/DDI and identify unique business event.	Repeat: one row per valid order item; show duplicate-grain test.	You can explain keys and measures at that grain.
Claims direct Databricks-to-local SQL connectivity	Track A boundary was forgotten.	Trace local-first diagram and notebook headers.	Explain manual upload/download and optional networked Track B.	Answer matches architecture.
STAR result is vague	No measurable/evidentiary outcome was recorded.	Open journal/test/run evidence.	State pass/fail, reconciled value, prevented publication, or corrected behavior; avoid invented metrics.	Result links to proof.

Message/symptom	Likely cause	Exact diagnostic	Safe fix	Verify
Cannot answer scale follow-up	Tradeoffs were not separated from current implementation.	List current bottlenecks/ boundaries by source, storage, compute, model, serving.	Discuss incremental/CDC, partitioning, concurrent jobs, observability, networking, security, and semantic performance as conditional changes.	Answer is requirement-driven rather than buzzwords.

For deeper tool-specific diagnosis, use [the troubleshooting index near the end of this workbook](#).

17. Explain it in your own words

1. Explain the entire platform to a nontechnical manager in two minutes.
2. Defend the grain of fact_sales and the use of SCD2.
3. Explain one failure from symptom to verification.
4. State what you would change first at 100 times the data volume and why.

Write your answers in the learning-journal fields in this phase. Do not copy the wording above.

18. Mini quiz

1. What six-part answer structure is recommended?
2. Which manual boundary must always be disclosed for Track A?
3. What kind of story should use the STAR format?

Record your answers before opening the answer key.

19. Screenshot checkpoint

Capture your completed design-defense worksheet, self-assessment rubric, and a practice setup showing the architecture/evidence—not recordings or personal details unless you choose to keep them private.

Save the image under docs/images/ with a descriptive filename. Check that no credential, token, password, or unnecessary personal account detail is visible.

20. Git checkpoint and suggested commit message

Run `git status`, review the Source Control diff in VS Code, stage only the intended files, then commit:

```
docs: add interview teach-back and design defense evidence
```

Push the feature branch only after tests pass.

21. Completion checklist

Use one status per item: Not started, In progress, Verified by me, or Needs troubleshooting.

☐

30-second explanation practiced — [STATUS]

☐

2-minute explanation practiced — [STATUS]

☐

5-minute architecture walkthrough practiced — [STATUS]

☐

10-minute technical walkthrough practiced — [STATUS]

☐

40+ questions attempted — [STATUS]

☐

Design defenses completed — [STATUS]

☐

STAR story evidence complete — [STATUS]

Self-assessment gaps converted to tasks — [STATUS]

Attempt the task and record what failed before reading the optional reference answer in this phase: the optional reference-answer section later in this workbook#phase-21. The quiz answer is in the answer-key section immediately after the quiz in this workbook#phase-21.

Next phase: Phase 22 presents optional extensions as separate choices after the required batch platform is verified.

Required action cards

Action 21.2.0 — Review your completed in-workbook journals and glossary before drafting interview answers

Application:

Visual Studio Code

Window or panel:

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

Starting condition:

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

Current folder or location:

The repository root C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username.

What you are about to do:

Review your completed in-workbook journals and glossary before drafting interview answers. This is one bounded construction or inspection task.

Why this action comes now:

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

Exact physical actions:

1. CLICK: Open this manual-build workbook in VS Code.
2. PRESS: Ctrl+F.
3. TYPE THIS: ## My Phase.
4. PRESS: Enter repeatedly to visit each phase journal you actually completed.
5. LOOK FOR: Record real errors, diagnostic actions, fixes, and lessons that can support truthful STAR stories.
6. PRESS: Ctrl+F.
7. TYPE THIS: # Complete glossary.
8. PRESS: Enter.
9. LOOK FOR: Rehearse the interview-ready definitions only after explaining each term in your own words.
10. DO NOT: Open or create a separate journal, glossary, or troubleshooting file.
11. DO NOT CONTINUE UNTIL: Every interview claim points to a real phase, commit, run result, or screenshot.

Command or code:

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

Where to enter it:

Visual Studio Code. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

What each part means:

1. CLICK: Open this manual-build workbook in VS Code.
2. PRESS: Ctrl+F.
3. TYPE THIS: ## My Phase.

4. PRESS: Enter repeatedly to visit each phase journal you actually completed.
5. LOOK FOR: Record real errors, diagnostic actions, fixes, and lessons that can support truthful STAR stories.
6. PRESS: Ctrl+F.
7. TYPE THIS: # Complete glossary.
8. PRESS: Enter.
9. LOOK FOR: Rehearse the interview-ready definitions only after explaining each term in your own words.
10. DO NOT: Open or create a separate journal, glossary, or troubleshooting file.
11. DO NOT CONTINUE UNTIL: Every interview claim points to a real phase, commit, run result, or screenshot.

What should happen:

A visible file, folder, branch, connection, table, notebook, task, relationship, measure, visual, or verification result should appear exactly where the action predicts.

Expected example:

Your exact values may differ. The expected result is the same *type* of object and the same required status, not necessarily the same timestamps, row counts, colors, generated IDs, or screen dimensions.

What may look different:

Menu wording can vary by product release or account tier. Use the official-source register and look for the described object rather than guessing from an old screenshot.

How to verify success:

Reopen or refresh the relevant panel, locate the named object, and inspect the property or output that proves it exists and is in the intended location.

Do not continue unless:

You can point to the visible result and explain what it proves. Mark the action VERIFIED BY USER only after that check.

Common mistake:

Combining several clicks or decisions, choosing a similarly named object, or continuing because no error dialog appeared.

Exact recovery:

Stop at the current screen. Save a screenshot of the error if useful, hide sensitive values, and compare the selected location with the starting condition. Use Back or Cancel rather than Delete or Overwrite. Correct one mismatch and repeat only this action.

What you just accomplished:

You completed one observable piece of the Northstar Retail platform and established a checkpoint that can be audited later.

How this connects to the project:

The resulting object, decision, or evidence becomes an input to the next stage in the source-to-consumption chain.

[Back to the Phase 21 lesson index](#)

Action 21.2.1 — Read the 30-second version once, then close it and explain the business problem, architecture, and outcome in

Application:

Visual Studio Code

Window or panel:

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

Starting condition:

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

Current folder or location:

The repository root C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username.

What you are about to do:

Read the 30-second version once, then close it and explain the business problem, architecture, and outcome in . This is one bounded construction or inspection task.

Why this action comes now:

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

Exact physical actions:

1. Bring the application named above to the front and confirm that no unrelated window has focus.
2. Read the starting condition and compare it with what is visible on your screen.
3. Perform only this immediate task: Read the 30-second version once, then close it and explain the business problem, architecture, and outcome in your own words. Record and compare.
4. Pause while the application finishes the operation; do not click the same control twice.
5. Inspect the visible result before changing another file, object, or setting.
6. Record the actual result in the verification field for this action.

Command or code:

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

Where to enter it:

Visual Studio Code. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

What each part means:**Step 1****Action**

Read the 30-second version once, then close it and explain the business problem, architecture, and outcome in your own words. Record and compare.

Before continuing☐

I used the application named in this phase.

☐

I confirmed the current folder/database/catalog/schema.

☐

I can describe what changed on the screen or filesystem.

☐

I know which later verification proves this step worked.

What should happen:

A visible file, folder, branch, connection, table, notebook, task, relationship, measure, visual, or verification result should appear exactly where the action predicts.

Expected example:

Your exact values may differ. The expected result is the same *type* of object and the same required status, not necessarily the same timestamps, row counts, colors, generated IDs, or screen dimensions.

What may look different:

Menu wording can vary by product release or account tier. Use the official-source register and look for the described object rather than guessing from an old screenshot.

How to verify success:

Reopen or refresh the relevant panel, locate the named object, and inspect the property or output that proves it exists and is in the intended location.

Do not continue unless:

You can point to the visible result and explain what it proves. Mark the action VERIFIED BY USER only after that check.

Common mistake:

Combining several clicks or decisions, choosing a similarly named object, or continuing because no error dialog appeared.

Exact recovery:

Stop at the current screen. Save a screenshot of the error if useful, hide sensitive values, and compare the selected location with the starting condition. Use Back or Cancel rather than Delete or Overwrite. Correct one mismatch and repeat only this action.

What you just accomplished:

You completed one observable piece of the Northstar Retail platform and established a checkpoint that can be audited later.

How this connects to the project:

The resulting object, decision, or evidence becomes an input to the next stage in the source-to-consumption chain.

The repository root C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username.

What you are about to do:

Practice scale changes: 100x data, CDC, streaming, partitioning, orchestration concurrency, data contracts, ob. This is one bounded construction or inspection task.

Why this action comes now:

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

Exact physical actions:

1. Bring the application named above to the front and confirm that no unrelated window has focus.
2. Read the starting condition and compare it with what is visible on your screen.
3. Perform only this immediate task: Practice scale changes: 100x data, CDC, streaming, partitioning, orchestration concurrency, data contracts, observability, cloud networking, security, and semantic performance.
4. Pause while the application finishes the operation; do not click the same control twice.
5. Inspect the visible result before changing another file, object, or setting.
6. Record the actual result in the verification field for this action.

Command or code:

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

Where to enter it:

Visual Studio Code. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

What each part means:

Step 9

Action

Practice scale changes: 100x data, CDC, streaming, partitioning, orchestration concurrency, data contracts, observability, cloud networking, security, and semantic performance.

Before continuing

☐

I used the application named in this phase.

☐

I confirmed the current folder/database/catalog/schema.

☐

I can describe what changed on the screen or filesystem.

☐

I know which later verification proves this step worked.

What should happen:

A visible file, folder, branch, connection, table, notebook, task, relationship, measure, visual, or verification result should appear exactly where the action predicts.

Expected example:

Your exact values may differ. The expected result is the same *type* of object and the same required status, not necessarily the same timestamps, row counts, colors, generated IDs, or screen dimensions.

What may look different:

Menu wording can vary by product release or account tier. Use the official-source register and look for the described object rather than guessing from an old screenshot.

How to verify success:

Reopen or refresh the relevant panel, locate the named object, and inspect the property or output that proves it exists and is in the intended location.

Do not continue unless:

You can point to the visible result and explain what it proves. Mark the action VERIFIED BY USER only after that check.

Common mistake:

Combining several clicks or decisions, choosing a similarly named object, or continuing because no error dialog appeared.

Exact recovery:

Stop at the current screen. Save a screenshot of the error if useful, hide sensitive values, and compare the selected location with the starting condition. Use Back or Cancel rather than Delete or Overwrite. Correct one mismatch and repeat only this action.

What you just accomplished:

You completed one observable piece of the Northstar Retail platform and established a checkpoint that can be audited later.

How this connects to the project:

The resulting object, decision, or evidence becomes an input to the next stage in the source-to-consumption chain.

[Back to the Phase 21 lesson index](#)

Action 21.2.C1 — Windows PowerShell

Application:

Windows PowerShell or the VS Code PowerShell terminal

Window or panel:

Windows PowerShell

Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

Current folder or location:

The repository root C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username.

What you are about to do:

Run one explained Powershell instruction and inspect its result before any next command is introduced.

Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

Exact physical actions:

1. CLICK: Bring **Windows PowerShell or the VS Code PowerShell terminal** to the front.
2. LOOK FOR: Confirm the current location matches The repository root C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

Command or code (Powershell):

```
code .\docs\interview_walkthrough.md
```

Where to enter it:

Windows PowerShell. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

What each part means:

- **Line 1:** code .\docs\interview_walkthrough.md — code is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; . is a path, relative location, branch-style name, or file argument; verify every character before running it; docs is a name, keyword, argument, identifier, or literal whose pro-

ject-specific role is described in the surrounding explanation; `interview_walkthrough.md` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation

Does it change anything?

This is intended to inspect or validate state rather than change it.

Is it safe to rerun?

Normally safe to rerun because it is observational, but still confirm the execution location first.

What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

Do not continue unless:

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

Common mistake:

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

Exact recovery:

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

What you just accomplished:

You executed and checked one controlled operation rather than treating a long script as a black box.

How this connects to the project:

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 21 lesson index](#)

Action 21.2.C2 — Windows PowerShell

Application:

Windows PowerShell or the VS Code PowerShell terminal

Window or panel:

Windows PowerShell

Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

Current folder or location:

The repository root `C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project`. The User segment is an example; verify your real Windows username.

What you are about to do:

Run one explained Powershell instruction and inspect its result before any next command is introduced.

Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

Exact physical actions:

1. CLICK: Bring **Windows PowerShell or the VS Code PowerShell terminal** to the front.
2. LOOK FOR: Confirm the current location matches The repository root C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

Command or code (Powershell):

Open the complete glossary section in this workbook

Where to enter it:

Windows PowerShell. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

What each part means:

- **Line 1:** Open the complete glossary section in this workbook — Open is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; the is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; complete is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; glossary is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; section is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; in is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; this is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; workbook is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation

Does it change anything?

This is intended to inspect or validate state rather than change it.

Is it safe to rerun?

Normally safe to rerun because it is observational, but still confirm the execution location first.

What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

Command or code (Powershell):

```
Select-String -Path the learning-journal fields in this workbook -Pattern 'What broke|How I diagnosed|What I learned'
```

Where to enter it:

Windows PowerShell. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

What each part means:

- **Line 1:** `Select-String -Path the learning-journal fields in this workbook -Pattern 'What broke|How I diagnosed|What I learned'` — `Select-String` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `-Path` is a command option or flag; its exact behavior is defined beside the command; `the` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `learning-journal` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `fields` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `in` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `this` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `workbook` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `-Pattern` is a command option or flag; its exact behavior is defined beside the command; `'What broke|How I diagnosed|What I learned'` is a quoted literal; the quotation marks preserve spaces or mark text

Does it change anything?

This is intended to inspect or validate state rather than change it.

Is it safe to rerun?

Normally safe to rerun because it is observational, but still confirm the execution location first.

What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

Do not continue unless:

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

Common mistake:

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

Exact recovery:

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

What you just accomplished:

You executed and checked one controlled operation rather than treating a long script as a black box.

How this connects to the project:

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 21 lesson index](#)

Action 21.2.C5 — Windows PowerShell

Application:

Windows PowerShell or the VS Code PowerShell terminal

Window or panel:

Windows PowerShell

Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

Current folder or location:

The repository root `C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project`. The User segment is an example; verify your real Windows username.

What you are about to do:

Run one explained Powershell instruction and inspect its result before any next command is introduced.

Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

Exact physical actions:

1. CLICK: Bring **Windows PowerShell or the VS Code PowerShell terminal** to the front.

2. LOOK FOR: Confirm the current location matches The repository root C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

Command or code (Powershell):

```
Get-ChildItem .\docs\images\*.svg | Select-Object Name
```

Where to enter it:

Windows PowerShell. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

What each part means:

- **Line 1:** `Get-ChildItem .\docs\images\*.svg | Select-Object Name` — `Get-ChildItem` lists files and folders; `.` is a path, relative location, branch-style name, or file argument; verify every character before running it; `docs` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `images` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `*` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `svg` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `Select-Object` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `Name` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation

Does it change anything?

This is intended to inspect or validate state rather than change it.

Is it safe to rerun?

Normally safe to rerun because it is observational, but still confirm the execution location first.

What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

Do not continue unless:

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

Common mistake:

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

Exact recovery:

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

What you just accomplished:

You executed and checked one controlled operation rather than treating a long script as a black box.

How this connects to the project:

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 21 lesson index](#)

What your screen should look like now

Each action you actually performed has a visible result and a recorded ownership status. You have not marked unrun reference commands as complete. The branch, connection, batch, and application context remain known.

Lesson 21.2 completion checklist

☐

I performed actions in order — [STATUS]

☐

I verified each command location — [STATUS]

☐

I distinguished typed text from observed output — [STATUS]

☐

I recorded differences caused by versions/tier — [STATUS]

☐

I stopped at the first unexplained error — [STATUS]

Safe stopping point

Save open work and record the next action number. Close an application only after its operation is complete. On return, re-open the Phase 21 starting-screen checklist and re-verify the active context.

Lesson 21.3 — Create and understand the phase files

What your screen should look like before starting

VS Code Explorer shows the repository root, the intended feature branch is active, and no Phase 21 file is assumed to exist merely because a reference answer appears below. Create each folder only when its first file is needed.

Folder introduction — docs/

Exact folder name: docs

Exact parent: repository root

Why it is needed now: Phase 21 is about to place its first responsibility-specific file here; creating it earlier would have produced an unexplained empty structure.

What will eventually be inside: Only files whose purpose matches this folder's name.

Why another folder is not appropriate: Separation keeps source SQL, transformations, tests, configuration, documentation, and generated artifacts reviewable.

Naming rules: Preserve lowercase/uppercase exactly as shown. Hyphens, underscores, spaces, and plural forms create different paths. This project avoids spaces in technical folder names.

VS Code method

1. CLICK: Open Explorer in VS Code.
2. LOOK FOR: Confirm the repository root is the top folder.

3. Expand the parent path repository root one level at a time.
4. RIGHT-CLICK: Right-click the immediate parent folder.
5. CLICK: **New Folder**.
6. TYPE THIS: docs.
7. PRESS: Enter.
8. LOOK FOR: The folder appears once, at the correct indentation level.

PowerShell method

Action 21.D1.1 — Create the folder docs

Application:

Windows PowerShell or the VS Code PowerShell terminal

Window or panel:

VS Code integrated PowerShell terminal at the repository root

Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

Current folder or location:

The repository root C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username.

What you are about to do:

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

Exact physical actions:

1. CLICK: Bring **Windows PowerShell or the VS Code PowerShell terminal** to the front.
2. LOOK FOR: Confirm the current location matches The repository root C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

Command or code (PowerShell):

```
New-Item -ItemType Directory -Path ".\docs" -ErrorAction Stop
```

Where to enter it:

VS Code integrated PowerShell terminal at the repository root. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

What each part means:

- **Line 1:** New-Item -ItemType Directory -Path ".\docs" -ErrorAction Stop — New-Item creates a file or folder; -ItemType is a command option or flag; its exact behavior is defined beside the command; Directory is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; -Path is a command option or flag; its exact behavior is defined beside the command; ".\docs" is a path, relative location, branch-style name, or file argument; verify every character before running it; -ErrorAction is a command option or

flag; its exact behavior is defined beside the command; Stop is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation

Does it change anything?

This can change files, Git state, packages, database objects, or data.

Is it safe to rerun?

Safe to rerun only after reading the idempotency note and confirming that the same batch, file, or object will not be duplicated.

What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use Get-Location or Test-Path; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

Do not continue unless:

The result is visible, understandable, and recorded as RUN BY USER or VERIFIED BY USER. Displaying this workbook does not count as execution.

Common mistake:

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

Exact recovery:

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

What you just accomplished:

You executed and checked one controlled operation rather than treating a long script as a black box.

How this connects to the project:

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 21 lesson index](#)

Folder-creation decision branches

If the folder is created

Run `Test-Path -LiteralPath ".\docs" -PathType Container` and require True.

If PowerShell says the folder already exists

Do not delete or recreate it. Run `Get-ChildItem -LiteralPath ".\docs" -Force`, inspect its existing files, and preserve them. Continue only when the existing folder is the intended path.

If the parent path does not exist

Return to the parent-folder tutorial. Create and verify one parent level at a time; do not create the entire future tree in one command.

Verify the folder

1. Run `Test-Path ".\docs" -PathType Container`.
2. Require the output True before creating a child file.
3. Remember: Git does not track an empty folder by itself; the folder becomes visible in Git history when a tracked file is added.

File introduction — docs/interview_walkthrough.md

Exact filename: interview_walkthrough.md

Filename extension: .md. In this project it identifies project documentation and helps the correct application choose syntax highlighting or execution behavior.

Exact parent folder: docs relative to the repository root.

Why this file belongs there: Files with the same responsibility are grouped so a reviewer can find configuration, source SQL, transformations, tests, documentation, and report assets without guessing.

What the file will contain: project documentation for Phase 21.

Later dependencies: Later phase commands, tests, GitHub Actions, Databricks tasks, warehouse loads, Power BI work, or portfolio evidence may depend on its exact path.

Should Git track it? Yes, unless the lesson explicitly identifies it as generated data, a local secret, a log, or a machine-specific artifact.

Could it contain secrets? It should not contain live passwords, tokens, connection strings, or account identifiers.

What happens if it is missing: The corresponding phase cannot be reproduced, validated, or explained from the repository alone.

VS Code click path

1. CLICK: In VS Code, open **Explorer** from the left Activity Bar.
2. LOOK FOR: Confirm the top-level folder name is SQL-Data-Warehouse-Project and the status bar shows the intended Git branch.
3. CLICK: Expand each parent folder in docs one level at a time.
4. If a parent folder does not exist, use the folder tutorial in this phase before creating the file.
5. RIGHT-CLICK: Right-click the immediate parent folder.
6. CLICK: Select **New File**.
7. TYPE THIS: interview_walkthrough.md.
8. PRESS: Enter.
9. LOOK FOR: A new editor tab labeled interview_walkthrough.md and an empty file under the correct parent folder.
10. PRESS: Ctrl+S after adding each explained section.

PowerShell path

Action 21.F1.1 — Create the file docs/interview_walkthrough.md from PowerShell

Application:

Windows PowerShell or the VS Code PowerShell terminal

Window or panel:

VS Code integrated PowerShell terminal opened at the repository root

Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

Current folder or location:

The repository root C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username.

What you are about to do:

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

Exact physical actions:

1. CLICK: Bring **Windows PowerShell or the VS Code PowerShell terminal** to the front.
2. LOOK FOR: Confirm the current location matches The repository root C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.

4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

Command or code (PowerShell):

```
New-Item -ItemType File -Path ".\docs\interview_walkthrough.md" -ErrorAction Stop
```

Where to enter it:

VS Code integrated PowerShell terminal opened at the repository root. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

What each part means:

- **Line 1:** `New-Item -ItemType File -Path ".\docs\interview_walkthrough.md" -ErrorAction Stop` — `New-Item` creates a file or folder; `-ItemType` is a command option or flag; its exact behavior is defined beside the command; `File` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `-Path` is a command option or flag; its exact behavior is defined beside the command; `".\docs\interview_walkthrough.md"` is a path, relative location, branch-style name, or file argument; verify every character before running it; `-ErrorAction` is a command option or flag; its exact behavior is defined beside the command; `Stop` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation

Does it change anything?

This can change files, Git state, packages, database objects, or data.

Is it safe to rerun?

Safe to rerun only after reading the idempotency note and confirming that the same batch, file, or object will not be duplicated.

What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

Do not continue unless:

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

Common mistake:

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

Exact recovery:

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

What you just accomplished:

You executed and checked one controlled operation rather than treating a long script as a black box.

How this connects to the project:

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 21 lesson index](#)

File-creation decision branches

If the command creates the file

Run `Test-Path -LiteralPath ".\docs\interview_walkthrough.md" -PathType Leaf`. Continue only when it returns True and the file is empty because you just created it.

If PowerShell says the file already exists

Do not add `-Force`, do not clear the file, and do not overwrite it. Open the existing file in VS Code, run `git status --short -- "docs/interview_walkthrough.md"`, inspect its contents and Git history, and decide whether this lesson should edit the preserved file rather than create a new one.

If PowerShell says part of the path does not exist

Stop. Create only the missing parent folder through the earlier folder tutorial, verify it with `Test-Path -PathType Container`, and rerun this one file command.

File-content construction

1. Start with the smallest header, comment, or first section shown in the phase lesson.
2. Read the purpose before typing the section.
3. Add one logical section at a time.
4. Save with Ctrl+S.
5. Run the syntax or content validation named in the phase.
6. Correct the first error before adding another section.
7. Use TODO(USER) where the workbook requires your own decision or verified value.

File verification

1. In the VS Code Explorer, confirm the file appears under docs.
2. Right-click the editor tab and choose **Copy Path**; compare the ending with `docs/interview_walkthrough.md`.
3. In PowerShell at the repository root, run `Test-Path ".\docs\interview_walkthrough.md"` and require True.
4. Run `git status --short -- "docs/interview_walkthrough.md"` to see only this file's Git state.
5. Run the phase-specific validator before committing.

Optional reference answer for docs/interview_walkthrough.md

Attempt the file construction first. This reference is learning material, not evidence that you created or ran the file.

Language: Markdown

Exact file: `docs/interview_walkthrough.md`

Purpose: project documentation.

Inputs: The requirements, configuration, source data, or upstream objects described in Phase 21.

Expected outputs: The file's declared objects, logs, tables, checks, or documentation when the user later runs or reads it.

```
# Interview and Teach-Back Preparation
```

```
## 30-second explanation
```

```
Northstar Retail is a fictional omnichannel data platform I am building from local SQL Server, PostgreSQL, and file feeds. I generate reproducible synthetic data, extract it in traceable batches, process Bronze, Silver, and Gold Delta layers in Databricks Jobs, publish a dimensional warehouse back to SQL Server, and define Power BI measures. I only present results after reconciliation and data-quality gates pass.
```

```
## 2-minute explanation
```

```
Leadership's reports disagree because operational sales and inventory, digital behavior, marketing, shipping, and returns are separated. The local-first architecture keeps SQL Server and PostgreSQL on my Windows computer, uses Python for generation, load, manifest-driven extraction, and publication, and uses a manual Unity Catalog volume boundary because cloud Databricks cannot reach localhost. Bronze preserves source evidence, Silver standardizes and quarantines controlled defects, and Gold uses conformed dimensions, SCD Type 2 for customers/products, and facts with explicit grain. A Lakeflow Job enforces dependencies and blocks publication on failed tests. The validated Gold export is loaded transactionally into 'NorthstarRetail_DW', and Power BI uses a single-direction star schema and documented DAX measures. My proof is the batch manifest, job run, quality results, SQL reconciliation, and matching Power BI values—not file existence alone.
```

```
## 5-minute architecture walkthrough
```

```
1. Requirements: define stakeholders, grains, KPI formulas, date roles, quality expectations, and exclusions first.
```

2. ****Sources:**** normalized ERP in SQL Server, digital model in PostgreSQL, and file feeds. All records are fictional and reproducible.

3. ****Local orchestration boundary:**** Python extracts full or incremental batches with batch ID, row count, and checksum; I manually upload one immutable folder.

4. ****Lakehouse:**** Bronze appends/replaces the batch with audit metadata; Silver casts, cleans, deduplicates, conforms, and quarantines; Gold resolves SCD-aware dimensions and fact grains.

5. ****Workflow:**** environment, parallel Bronze tasks, dependent Silver domains, dimensions, facts, data-quality gate, publish, and final reconciliation.

6. ****Serving:**** download validated Gold, stage and load SQL Server warehouse in a transaction, then refresh Power BI.

7. ****Trust:**** reconcile source-to-Bronze, Bronze-to-Silver, Silver-to-Gold, revenue, duplicate reruns, and semantic measures.

8. ****Limitations:**** manual handoffs and simplified attribution are intentional Track A constraints; Track B covers managed networking and direct JDBC as an extension.

10-minute technical walkthrough outline

- Minute 0–1: business problem and definitions.
- Minute 1–2: source ERDs and generated quality fixtures.
- Minute 2–3: repository, configuration, credentials, and batch manifest.
- Minute 3–5: medallion contracts, example customer cleanup, and quarantine.
- Minute 5–6: SCD2 timeline and event-time dimension lookup.
- Minute 6–7: fact_sales grain, revenue arithmetic, unknown keys.
- Minute 7–8: Jobs dependency and failure/repair behavior.
- Minute 8–9: SQL Server publication and Power BI relationships/measures.
- Minute 9–10: verification evidence, limitations, and next scaling step.

Interview questions and beginner-friendly answers

1. What business problem does the project solve?

****Answer:**** It brings operational sales, digital behavior, batch files, inventory, shipping, returns, and marketing into a governed daily platform so different teams use the same definitions. The technical success criterion is not merely moving data; it is producing traceable, reconciled facts and reusable semantic measures.

****Likely follow-up:**** Give one concrete file, query, test, or screenshot from your verified run that proves the answer.

2. Why use Bronze, Silver, and Gold?

****Answer:**** Each layer has a different contract. Bronze preserves the source and batch evidence, Silver applies explicit quality and conformance rules, and Gold presents stable dimensional grains. Separating them makes reruns, debugging, lineage, and ownership clearer than one giant transformation.

****Likely follow-up:**** Give one concrete file, query, test, or screenshot from your verified run that proves the answer.

3. Why use both SQL Server and PostgreSQL?

****Answer:**** The fictional company has separate operational domains and the project demonstrates heterogeneous-source integration. It also teaches that SQL dialects, drivers, tools, and operational design differ; it is not an argument that every real company needs both.

****Likely follow-up:**** Give one concrete file, query, test, or screenshot from your verified run that proves the answer.

4. Why is the source model normalized but the warehouse dimensional?

****Answer:**** Operational systems normalize data to support correct transactional updates and reduce repeated facts. Analytics favors dimensions and facts because users repeatedly filter, group, and aggregate; a star schema reduces join ambiguity and makes business grain visible.

****Likely follow-up:**** Give one concrete file, query, test, or screenshot from your verified run that proves the answer.

5. What is the grain of fact_sales?

****Answer:**** One valid order item, identified by `order_item_id`. Quantity, revenue, discounts, cost, and profit are additive at that grain, and order-level metrics use distinct `order_id` rather than counting fact rows.

****Likely follow-up:**** Give one concrete file, query, test, or screenshot from your verified run that proves the answer.

6. What is grain and why declare it first?

****Answer:**** Grain is exactly what one row represents. Without it, keys and measures can silently double-count. Declaring grain determines uniqueness tests, dimension lookups, additive behavior, and valid joins.

****Likely follow-up:**** Give one concrete file, query, test, or screenshot from your verified run that proves the answer.

7. What is a surrogate key?

****Answer:**** A warehouse-controlled key such as `customer_key`. It is separate from the source `customer_number` and allows multiple historical versions, unknown members, and source-system integration without changing the natural business identifier.

****Likely follow-up:**** Give one concrete file, query, test, or screenshot from your verified run that proves the answer.

8. How did you prevent duplicate loads?

****Answer:**** Each task receives one batch ID. Bronze replaces the same batch before appending; Silver uses batch replacement or merge; Gold enforces deterministic grain and uniqueness checks; the Job permits only one concurrent run. I verify a repair rerun leaves counts stable.

****Likely follow-up:**** Give one concrete file, query, test, or screenshot from your verified run that proves the answer.

9. What makes a pipeline idempotent?

****Answer:**** Running the same input and batch again produces the same trusted state rather than an extra copy. Idempotency requires stable identities, controlled overwrite/merge scopes, transactions where appropriate, and tests—not merely a statement in documentation.

****Likely follow-up:**** Give one concrete file, query, test, or screenshot from your verified run that proves the answer.

10. How did you handle SCD Type 2?

****Answer:**** I compare a hash of tracked attributes on the current dimension row. A change expires the old version with an end date and current flag false, then inserts a new current version. Facts look up the version whose effective dates contain the event date.

****Likely follow-up:**** Give one concrete file, query, test, or screenshot from your verified run that proves the answer.
11. Why Type 2 for customer and product?

****Answer:**** Historical customer tier/address attributes and product category/cost/descriptions can change, and past reports may need the attributes that were true at the event time. Type 1 would overwrite history. I choose tracked columns deliberately because Type 2 on every field creates noise.

****Likely follow-up:**** Give one concrete file, query, test, or screenshot from your verified run that proves the answer.
12. What is the unknown member?

****Answer:**** Dimension key 0 represents missing, invalid, or late-arriving dimension context. It keeps fact foreign keys valid and makes the problem measurable. It is not permission to ignore source quality; unknown-key rates are quality checks.

****Likely follow-up:**** Give one concrete file, query, test, or screenshot from your verified run that proves the answer.
13. How do you handle late-arriving dimensions?

****Answer:**** The fact can temporarily use key 0 while retaining the natural key and batch evidence. A later repair resolves the dimension and updates the fact under a controlled rule. Alternatively, a minimal inferred member can be created, but that policy must be explicit.

****Likely follow-up:**** Give one concrete file, query, test, or screenshot from your verified run that proves the answer.
14. How did you validate revenue?

****Answer:**** I use the same valid-line population and formula—quantity times unit price minus line discount—from Silver through Gold, SQL Server, and Power BI. I compare row counts and sums, define exclusions, and accept only documented rounding tolerance.

****Likely follow-up:**** Give one concrete file, query, test, or screenshot from your verified run that proves the answer.
15. What does a data-quality gate do?

****Answer:**** It stores test results and raises a task failure when a required rule fails. Publication depends on that task, so a bad batch cannot be exported just because a user clicks the next notebook.

****Likely follow-up:**** Give one concrete file, query, test, or screenshot from your verified run that proves the answer.
16. What kinds of dirty data are included?

****Answer:**** Controlled duplicate business keys, null/malformed emails, whitespace/case issues, invalid codes, impossible quantities, unknown references, mixed date formats, late records, out-of-order events, currency differences, and time-zone variations. A fixture records configured injections.

****Likely follow-up:**** Give one concrete file, query, test, or screenshot from your verified run that proves the answer.
17. Why intentionally generate dirty data?

****Answer:**** Real engineering is mostly about behavior when inputs are imperfect. Controlled defects make quality rules testable and repeatable without using real personal data. Clean-only fixtures would let transformations appear correct without proving rejection and quarantine paths.

****Likely follow-up:**** Give one concrete file, query, test, or screenshot from your verified run that proves the answer.
18. What is quarantine?

****Answer:**** A governed table or path for records that cannot enter a trusted layer under current rules. It retains the source values, rule, batch, and timestamp so owners can investigate. Quarantine counts must reconcile with layer input.

****Likely follow-up:**** Give one concrete file, query, test, or screenshot from your verified run that proves the answer.
19. What is the difference between ETL and ELT here?

****Answer:**** Local source loading and extraction include ETL-like movement, while Databricks primarily follows ELT: land raw data first, then transform in the lakehouse. The important point is where transformation occurs and which copy is preserved.

****Likely follow-up:**** Give one concrete file, query, test, or screenshot from your verified run that proves the answer.
20. What happens when a Databricks task fails?

****Answer:**** Dependent tasks do not run. I inspect the exact task log and quality/quarantine evidence, fix the cause in version control, rerun local checks, then use a repair run from the earliest affected task. Same-batch behavior must not duplicate data.

****Likely follow-up:**** Give one concrete file, query, test, or screenshot from your verified run that proves the answer.
21. Why can't Databricks connect to localhost?

****Answer:**** The Databricks compute runs in a remote environment; its localhost is not my Windows computer. Track A therefore uses an uploaded file batch. Track B needs a network-accessible managed source, firewall/private networking, supported driver, and secret-managed identity.

****Likely follow-up:**** Give one concrete file, query, test, or screenshot from your verified run that proves the answer.
22. Why is Track A partly manual?

****Answer:**** It is a low-cost, honest learning architecture. The manual boundary isolates local systems from cloud networking while still teaching source extraction, manifests, lakehouse layers, orchestration, publication, and consumption. I label the operational limitation rather than disguising it.

****Likely follow-up:**** Give one concrete file, query, test, or screenshot from your verified run that proves the answer.
23. What is a high-water mark?

****Answer:**** The latest source update value that a successful extraction has fully processed. The next incremental run requests rows greater than that value. It advances only after success, and tie-breaker keys may be needed when timestamps are not unique.

****Likely follow-up:**** Give one concrete file, query, test, or screenshot from your verified run that proves the answer.
24. How do you handle a failure halfway through extraction?

****Answer:**** The extractor writes to a unique batch folder and records status in a manifest. I do not advance the watermark until the batch is complete. A failed partial batch is not treated as trusted input; I rerun with the same logical bounds or a new controlled batch.

****Likely follow-up:**** Give one concrete file, query, test, or screenshot from your verified run that proves the answer.
25. Why use checksums?

****Answer:**** A checksum helps prove that the file uploaded or processed is the same bytes the extractor wrote. It detects accidental change or corruption; it does not prove the data is semantically correct.

****Likely follow-up:**** Give one concrete file, query, test, or screenshot from your verified run that proves the answer.
26. What is Delta Lake adding?

****Answer:**** Delta tables provide transactional table behavior over lake files, schema metadata, versioned changes, and merge/update patterns. In this project they support batch replacement, merge, reproducible table access, and governed medallion layers.

****Likely follow-up:**** Give one concrete file, query, test, or screenshot from your verified run that proves the answer.
27. Why use a star schema?

****Answer:**** It gives each business event a clear fact grain and shared descriptive dimensions. BI relationships are predictable, SQL is understandable, and measures aggregate correctly when keys and relationships are designed well.

****Likely follow-up:**** Give one concrete file, query, test, or screenshot from your verified run that proves the answer.
28. What are additive and non-additive measures?

****Answer:**** Revenue and quantity are generally additive across all relevant dimensions. Ratios such as margin percentage are recalculated from aggregated numerator and denominator. Inventory snapshots are not additive across time because summing daily stock double-counts the same inventory.

****Likely follow-up:**** Give one concrete file, query, test, or screenshot from your verified run that proves the answer.
29. How do you define return rate?

****Answer:**** Returned units divided by sold units for a compatible population. I must state whether date filtering is by purchase date or return date, and I do not divide return rows by orders unless the business explicitly wants an order-return incidence metric.

****Likely follow-up:**** Give one concrete file, query, test, or screenshot from your verified run that proves the answer.
30. How do you define on-time delivery?

****Answer:**** Delivered shipments with actual delivery date on or before promised date divided by delivered shipments with an actual date. The grain is shipment, not order, because one order may split into multiple shipments.

****Likely follow-up:**** Give one concrete file, query, test, or screenshot from your verified run that proves the answer.
31. How is ROAS limited?

****Answer:**** The beginner model links converting sessions to order IDs and is essentially simplified last-session attribution. It does not establish causality or allocate multi-touch credit. I check duplicate links and present the attribution assumption beside the metric.

****Likely follow-up:**** Give one concrete file, query, test, or screenshot from your verified run that proves the answer.
32. Why use a semantic layer?

****Answer:**** It centralizes relationships, date behavior, measure formulas, formatting, descriptions, and reusable business definitions. Otherwise each report author can compute a different version of revenue or return rate.

****Likely follow-up:**** Give one concrete file, query, test, or screenshot from your verified run that proves the answer.
33. Why prefer explicit DAX measures?

****Answer:**** They are named, documented, format-controlled, reusable, and testable. Implicit sums hide business logic and can encourage users to aggregate technical columns incorrectly.

****Likely follow-up:**** Give one concrete file, query, test, or screenshot from your verified run that proves the answer.
34. Import or DirectQuery for Track A?

****Answer:**** Import is the default because the local warehouse is modest, interactive performance is predictable, and refresh can be controlled after publication. DirectQuery has freshness advantages but adds source load, latency, feature, and modeling constraints.

****Likely follow-up:**** Give one concrete file, query, test, or screenshot from your verified run that proves the answer.
35. How do you avoid ambiguous Power BI relationships?

****Answer:**** I use one-to-many, single-direction dimension-to-fact relationships. Secondary shipment date roles are inactive and activated in specific measures if needed. I avoid direct fact-to-fact joins and bidirectional filtering without a tested reason.

****Likely follow-up:**** Give one concrete file, query, test, or screenshot from your verified run that proves the answer.
36. What is data lineage?

****Answer:**** Evidence connecting a report value back through a measure, serving table, Gold fact/dimension, Silver transformation, Bronze record, source file/table, and batch. This project uses mappings, batch IDs, source/file metadata, task order, and reconciliation results.

****Likely follow-up:**** Give one concrete file, query, test, or screenshot from your verified run that proves the answer.
37. How do you protect secrets?

****Answer:**** Passwords stay in ignored ``.env`` files; Databricks uses secret management or identities; logs/screenshots are redacted; CI scans common patterns. If a secret is committed, I revoke or rotate it before cleaning history.

****Likely follow-up:**** Give one concrete file, query, test, or screenshot from your verified run that proves the answer.
38. What does least privilege mean here?

****Answer:**** Each identity gets only the permissions needed: source extractor read-only, workflow access to its catalog/schema/volume, publisher stage/load rights, and analysts read-only semantic access. An administrator credential is not a normal runtime credential.

****Likely follow-up:**** Give one concrete file, query, test, or screenshot from your verified run that proves the answer.
39. How does CI/CD help this project?

****Answer:**** The free GitHub Actions workflow checks structure, SQL dialect labels, notebook syntax/JSON, secret patterns, relative links, linting, and local tests. It cannot execute SQL Server or Databricks without paid/secured infrastructure, so those gates remain documented run evidence.

****Likely follow-up:**** Give one concrete file, query, test, or screenshot from your verified run that proves the answer.
40. What would change at 100 times the data volume?

****Answer:**** I would profile bottlenecks before redesigning. Likely changes include source-side partitioned/incremental extraction, bulk copy, optimized file sizes, partition/clustering choices, incremental Gold, stronger orchestration observability, scalable serving mode, and cost/performance testing. I would not simply use the portfolio scale setting.

****Likely follow-up:**** Give one concrete file, query, test, or screenshot from your verified run that proves the answer.
41. Which parts are batch and what could stream?

****Answer:**** All required phases are daily batch. Web events, inventory movements, and shipment tracking could become streaming, but dimensions, late data, deduplication, watermarks, cost, and exactly-once expectations would need a separate design.

****Likely follow-up:**** Give one concrete file, query, test, or screenshot from your verified run that proves the answer.
42. What are the limitations of the local-first track?

****Answer:**** Manual handoffs, no real-time operation, local service availability, no production identity/network design, simplified attribution, USD-only reporting, and incomplete production observability. Those are explicitly documented rather than presented as enterprise production readiness.

****Likely follow-up:**** Give one concrete file, query, test, or screenshot from your verified run that proves the answer.
43. How would you add CDC?

****Answer:**** Choose source-supported change data capture, retain operation type and source ordering metadata in Bronze, deduplicate by source position, apply deletes deliberately, and test replay/idempotency. It requires database configuration and privileges beyond the beginner path.

****Likely follow-up:**** Give one concrete file, query, test, or screenshot from your verified run that proves the answer.
44. How would you handle schema drift?

****Answer:**** Bronze may permit intentional additive columns while recording schema; Silver uses explicit selections/casts and fails or quarantines unsupported changes. A schema-drift test alerts before Gold and semantic contracts silently change.

****Likely follow-up:**** Give one concrete file, query, test, or screenshot from your verified run that proves the answer.
45. What did you personally implement versus use as reference material?

****Answer:**** The workbook provides curriculum, boilerplate, patterns, TODO skeletons, tests, and reference answers. I only claim tasks after I type/adapt them, run them in my environment, capture evidence, and explain them. The final definition-of-done distinguishes reference material from personal verification.

****Likely follow-up:**** Give one concrete file, query, test, or screenshot from your verified run that proves the answer.

Defend every design choice worksheet

For each decision, complete all columns before an interview.

Decision	Requirement it serves	Alternative	Why not chosen now	Failure mode	Test/evidence	What would change at scale
Manual volume handoff	Low-cost local sources	Direct JDBC	No safe route to localhost	Wrong/missing batch	Manifest + environment check	Cloud-managed sources/network
SCD2 customer	Historical attributes	Type 1	Would rewrite history	Overlap/multiple current rows	SCD tests	Identity resolution/MDM
[ADD DECISION]						

STAR troubleshooting story template

- ****Situation:**** What business/pipeline context existed? Include phase and batch, not confidential details.
- ****Task:**** What trustworthy outcome were you responsible for?
- ****Action:**** What evidence did you inspect, how did you isolate the cause, what code/config/test changed, and how did you protect data?
- ****Result:**** What verified test/reconciliation passed? Use real numbers only after your run.
- ****Reflection:**** What prevention or monitoring did you add?

Final self-assessment rubric

Score each 0–3: 0 not started, 1 can follow, 2 can explain and reproduce, 3 can adapt and defend.

Area	0	1	2	3
Requirements/KPIs	Cannot define	Reads definitions	Reproduces and validates	Resolves ambiguity with stakeholders
SQL/source design	Cannot navigate	Runs provided DDL	Explains keys/indexes/dialects	Adapts model safely
Python/generation	Cannot run	Runs quick mode	Explains functions/seed/FKS	Adds a domain and tests
Ingestion/manifest	Cannot trace batch	Follows steps	Explains checksums/watermarks	Repairs/replays safely
Spark/Delta	Cannot identify layers	Runs notebooks	Explains transformations/merge	Tunes and handles drift
Dimensional model	Cannot state grain	Names facts/dims	Defends grain/SCD/unknowns	Evolves model without breaking history
Quality/reconciliation	Relies on screenshots	Runs tests	Explains gates and tie-outs	Designs new risk-based checks
Jobs/operations	Clicks run	Follows graph	Repairs failed run safely	Designs alerts and operational SLOs
Power BI	Builds visuals only	Adds measures	Validates context/relationships	Diagnoses complex totals/roles
Security/cost/Git	Uses defaults	Follows checklist	Explains least privilege/CI	Designs production controls
Communication	Recites tools	Gives overview	Tells evidence-based story	Handles follow-up tradeoffs calmly

Line-by-line explanation

- **Line 7:** ## 2-minute explanation is a comment for a human reader; it normally does not change data or execute business logic.
- **Line 8:** blank line used only to separate logical sections for readability.
- **Line 9:** Leadership's reports disagree because operational sales and inventory, digital behavior, marketing, shipping, and returns are separated. The local-first architecture keeps SQL Server and PostgreSQL on my Windows computer, uses Python for generation, load, manifest-driven extraction, and publication, and uses a manual Unity Catalog volume boundary because cloud Databricks cannot reach localhost. Bronze preserves source evidence, Silver standardizes and quarantines controlled defects, and Gold uses conformed dimensions, SCD Type 2 for customers/products, and facts with explicit grain. A Lakeflow Job enforces dependencies and blocks publication on failed tests. The validated Gold export is loaded transactionally into \NorthstarRetail_DW`, and Power BI uses a single-direction star schema and documented DAX measures. My proof is the batch manifest, job run, quality results, SQL reconciliation, and matching Power BI values—not file existence alone.—Leadership is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; sis a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; reports is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; disagree is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; because is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; operational is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; sales is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; and is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; inventory is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; , is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; digital is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; behavior is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; remaining punctuation and identifiers continue the same statement.

- **Line 33:** blank line used only to separate logical sections for readability.
- **Line 34:** # Interview questions and beginner-friendly answers is a comment for a human reader; it normally does not change data or execute business logic.
- **Line 35:** blank line used only to separate logical sections for readability.
- **Line 36:** ## 1. What business problem does the project solve? is a comment for a human reader; it normally does not change data or execute business logic.
- **Line 37:** blank line used only to separate logical sections for readability.
- **Line 38:** **Answer:** It brings operational sales, digital behavior, batch files, inventory, shipping, returns, and marketing into a governed daily platform so different teams use the same definitions. The technical success criterion is not merely moving data; it is producing traceable, reconciled facts and reusable semantic measures. — ** is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; Answer is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; : ** is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; It is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; brings is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; operational is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; sales is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; , is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; digital is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; behavior is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; , is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; batch is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; remaining punctuation and identifiers continue the same statement.
- **Line 39:** blank line used only to separate logical sections for readability.
- **Line 40:** **Likely follow-up:** Give one concrete file, query, test, or screenshot from your verified run that proves the answer. — ** is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; Likely is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; follow-up is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; : ** is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; Give is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; one is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; concrete is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; file is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; , is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; query is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; , is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; test is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; remaining punctuation and identifiers continue the same statement.
- **Line 41:** ## 2. Why use Bronze, Silver, and Gold? is a comment for a human reader; it normally does not change data or execute business logic.
- **Line 42:** blank line used only to separate logical sections for readability.
- **Line 43:** **Answer:** Each layer has a different contract. Bronze preserves the source and batch evidence, Silver applies explicit quality and conformance rules, and Gold presents stable dimensional grains. Separating them makes reruns, debugging, lineage, and ownership clearer than one giant transformation. — ** is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; Answer is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; : ** is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; Each is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; layer is a name, keyword, argument, identifier, or literal

whose project-specific role is described in the surrounding explanation; has is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; a is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; different is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; contract is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; . is a path, relative location, branch-style name, or file argument; verify every character before running it; Bronze is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; preserves is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; remaining punctuation and identifiers continue the same statement.

- **Line 44:** blank line used only to separate logical sections for readability.
- **Line 45:** ****Likely follow-up:**** Give one concrete file, query, test, or screenshot from your verified run that proves the answer. — ****** is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; Likely is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; follow-up is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; **:**** is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; Give is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; one is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; concrete is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; file is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; , is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; query is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; , is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; test is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; remaining punctuation and identifiers continue the same statement.
- **Line 46:** **## 3. Why use both SQL Server and PostgreSQL?** is a comment for a human reader; it normally does not change data or execute business logic.
- **Line 47:** blank line used only to separate logical sections for readability.
- **Line 48:** ****Answer:**** The fictional company has separate operational domains and the project demonstrates heterogeneous-source integration. It also teaches that SQL dialects, drivers, tools, and operational design differ; it is not an argument that every real company needs both. — ****** is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; Answer is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; **:**** is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; The is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; fictional is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; company is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; has is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; separate is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; operational is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; domains is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; and is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; the is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; remaining punctuation and identifiers continue the same statement.

File introduction — docs/claim_to_evidence_map.md

Exact filename: claim_to_evidence_map.md

Filename extension: .md. In this project it identifies project documentation and helps the correct application choose syntax highlighting or execution behavior.

Exact parent folder: docs relative to the repository root.

Why this file belongs there: Files with the same responsibility are grouped so a reviewer can find configuration, source SQL, transformations, tests, documentation, and report assets without guessing.

What the file will contain: project documentation for Phase 21.

Later dependencies: Later phase commands, tests, GitHub Actions, Databricks tasks, warehouse loads, Power BI work, or portfolio evidence may depend on its exact path.

Should Git track it? Yes, unless the lesson explicitly identifies it as generated data, a local secret, a log, or a machine-specific artifact.

Could it contain secrets? It should not contain live passwords, tokens, connection strings, or account identifiers.

What happens if it is missing: The corresponding phase cannot be reproduced, validated, or explained from the repository alone.

VS Code click path

1. CLICK: In VS Code, open **Explorer** from the left Activity Bar.
2. LOOK FOR: Confirm the top-level folder name is SQL-Data-Warehouse-Project and the status bar shows the intended Git branch.
3. CLICK: Expand each parent folder in docs one level at a time.
4. If a parent folder does not exist, use the folder tutorial in this phase before creating the file.
5. RIGHT-CLICK: Right-click the immediate parent folder.
6. CLICK: Select **New File**.
7. TYPE THIS: claim_to_evidence_map.md.
8. PRESS: Enter.
9. LOOK FOR: A new editor tab labeled claim_to_evidence_map.md and an empty file under the correct parent folder.
10. PRESS: Ctrl+S after adding each explained section.

PowerShell path

Action 21.F2.1 — Create the file docs/claim_to_evidence_map.md from PowerShell

Application:

Windows PowerShell or the VS Code PowerShell terminal

Window or panel:

VS Code integrated PowerShell terminal opened at the repository root

Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

Current folder or location:

The repository root C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username.

What you are about to do:

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

Exact physical actions:

1. CLICK: Bring **Windows PowerShell or the VS Code PowerShell terminal** to the front.
2. LOOK FOR: Confirm the current location matches The repository root C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.

4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

Command or code (PowerShell):

```
New-Item -ItemType File -Path ".\docs\claim_to_evidence_map.md" -ErrorAction Stop
```

Where to enter it:

VS Code integrated PowerShell terminal opened at the repository root. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

What each part means:

- **Line 1:** `New-Item -ItemType File -Path ".\docs\claim_to_evidence_map.md" -ErrorAction Stop` — `New-Item` creates a file or folder; `-ItemType` is a command option or flag; its exact behavior is defined beside the command; `File` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `-Path` is a command option or flag; its exact behavior is defined beside the command; `".\docs\claim_to_evidence_map.md"` is a path, relative location, branch-style name, or file argument; verify every character before running it; `-ErrorAction` is a command option or flag; its exact behavior is defined beside the command; `Stop` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation

Does it change anything?

This can change files, Git state, packages, database objects, or data.

Is it safe to rerun?

Safe to rerun only after reading the idempotency note and confirming that the same batch, file, or object will not be duplicated.

What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

Do not continue unless:

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

Common mistake:

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

Exact recovery:

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

What you just accomplished:

You executed and checked one controlled operation rather than treating a long script as a black box.

How this connects to the project:

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 21 lesson index](#)

File-creation decision branches

If the command creates the file

Run `Test-Path -LiteralPath ".\docs\claim_to_evidence_map.md" -PathType Leaf`. Continue only when it returns True and the file is empty because you just created it.

If PowerShell says the file already exists

Do not add `-Force`, do not clear the file, and do not overwrite it. Open the existing file in VS Code, run `git status --short -- "docs/claim_to_evidence_map.md"`, inspect its contents and Git history, and decide whether this lesson should edit the preserved file rather than create a new one.

If PowerShell says part of the path does not exist

Stop. Create only the missing parent folder through the earlier folder tutorial, verify it with `Test-Path -PathType Container`, and rerun this one file command.

File-content construction

1. Start with the smallest header, comment, or first section shown in the phase lesson.
2. Read the purpose before typing the section.
3. Add one logical section at a time.
4. Save with `Ctrl+S`.
5. Run the syntax or content validation named in the phase.
6. Correct the first error before adding another section.
7. Use `TODD(USER)` where the workbook requires your own decision or verified value.

File verification

1. In the VS Code Explorer, confirm the file appears under docs.
2. Right-click the editor tab and choose **Copy Path**; compare the ending with `docs/claim_to_evidence_map.md`.
3. In PowerShell at the repository root, run `Test-Path ".\docs\claim_to_evidence_map.md"` and require True.
4. Run `git status --short -- "docs/claim_to_evidence_map.md"` to see only this file's Git state.
5. Run the phase-specific validator before committing.

Optional reference answer for docs/claim_to_evidence_map.md

Attempt the file construction first. This reference is learning material, not evidence that you created or ran the file.

Language: Markdown

Exact file: `docs/claim_to_evidence_map.md`

Purpose: project documentation.

Inputs: The requirements, configuration, source data, or upstream objects described in Phase 21.

Expected outputs: The file's declared objects, logs, tables, checks, or documentation when the user later runs or reads it.

```
# Claim-to-Evidence Map

Do not convert a reference capability into a personal achievement until the evidence column is complete.

| Claim | Status | Evidence type | Exact file/run/query | Batch/date/commit | Reviewer note |
|---|---|---|---|---|---|
| Quick synthetic fixture is deterministic | Reference only; user verification required | pytest + manifest | `tests/unit/test_generator.py`; `datasets/sample/generation_manifest.json` | Seed 20260815 | Re-run locally |
| SQL Server ERP is loaded | Not started | SSMS row counts + loader artifact | `[ADD]` | `[ADD]` | Do not claim yet |
| PostgreSQL digital source is loaded | Not started | pgAdmin/psql counts + artifact | `[ADD]` | `[ADD]` | Do not claim yet |
| Databricks Job completed and quality passed | Not started | Job run ID + quality table | `[ADD]` | `[ADD]` | Do not claim yet |
| Gold reconciles to SQL Server warehouse | Not started | export manifest + audit SQL | `[ADD]` | `[ADD]` | Do not claim yet |
| Power BI measures match SQL | Not started | validation table/screenshot | `[ADD]` | `[ADD]` | Do not claim yet |
| GitHub Actions validates repository | Not started | Actions run URL/checks | `[ADD]` | `[ADD]` | Do not claim yet |
```

Line-by-line explanation

- **Line 1:** `# Claim-to-Evidence Map` is a comment for a human reader; it normally does not change data or execute business logic.

- **Line 2:** blank line used only to separate logical sections for readability.
- **Line 3:** Do not convert a reference capability into a personal achievement until the evidence column is complete. — Do is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; not is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; convert is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; a is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; reference is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; capability is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; into is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; a is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; personal is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; achievement is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; until is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; the is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; remaining punctuation and identifiers continue the same statement.

[Back to the Phase 21 lesson index](#)

File introduction — docs/data_lineage.md

Exact filename: data_lineage.md

Filename extension: .md. In this project it identifies project documentation and helps the correct application choose syntax highlighting or execution behavior.

Exact parent folder: docs relative to the repository root.

Why this file belongs there: Files with the same responsibility are grouped so a reviewer can find configuration, source SQL, transformations, tests, documentation, and report assets without guessing.

What the file will contain: project documentation for Phase 21.

Later dependencies: Later phase commands, tests, GitHub Actions, Databricks tasks, warehouse loads, Power BI work, or portfolio evidence may depend on its exact path.

Should Git track it? Yes, unless the lesson explicitly identifies it as generated data, a local secret, a log, or a machine-specific artifact.

Could it contain secrets? It should not contain live passwords, tokens, connection strings, or account identifiers.

What happens if it is missing: The corresponding phase cannot be reproduced, validated, or explained from the repository alone.

VS Code click path

1. CLICK: In VS Code, open **Explorer** from the left Activity Bar.

2. LOOK FOR: Confirm the top-level folder name is SQL-Data-Warehouse-Project and the status bar shows the intended Git branch.
3. CLICK: Expand each parent folder in docs one level at a time.
4. If a parent folder does not exist, use the folder tutorial in this phase before creating the file.
5. RIGHT-CLICK: Right-click the immediate parent folder.
6. CLICK: Select **New File**.
7. TYPE THIS: `data_lineage.md`.
8. PRESS: Enter.
9. LOOK FOR: A new editor tab labeled `data_lineage.md` and an empty file under the correct parent folder.
10. PRESS: Ctrl+S after adding each explained section.

PowerShell path

Action 21.F3.1 — Create the file `docs/data_lineage.md` from PowerShell

Application:

Windows PowerShell or the VS Code PowerShell terminal

Window or panel:

VS Code integrated PowerShell terminal opened at the repository root

Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

Current folder or location:

The repository root `C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project`. The User segment is an example; verify your real Windows username.

What you are about to do:

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

Exact physical actions:

1. CLICK: Bring **Windows PowerShell or the VS Code PowerShell terminal** to the front.
2. LOOK FOR: Confirm the current location matches The repository root `C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project`. The User segment is an example; verify your real Windows username. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

Command or code (PowerShell):

```
New-Item -ItemType File -Path ".\docs\data_lineage.md" -ErrorAction Stop
```

Where to enter it:

VS Code integrated PowerShell terminal opened at the repository root. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

What each part means:

- **Line 1:** `New-Item -ItemType File -Path ".\docs\data_lineage.md" -ErrorAction Stop` — `New-Item` creates a file or folder; `-ItemType` is a command option or flag; its exact behavior is defined beside the command; `File` is a name,

keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; -Path is a command option or flag; its exact behavior is defined beside the command; ".\docs\data_lineage.md" is a path, relative location, branch-style name, or file argument; verify every character before running it; -ErrorAction is a command option or flag; its exact behavior is defined beside the command; Stop is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation

Does it change anything?

This can change files, Git state, packages, database objects, or data.

Is it safe to rerun?

Safe to rerun only after reading the idempotency note and confirming that the same batch, file, or object will not be duplicated.

What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use Get-Location or Test-Path; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

Do not continue unless:

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

Common mistake:

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

Exact recovery:

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

What you just accomplished:

You executed and checked one controlled operation rather than treating a long script as a black box.

How this connects to the project:

This verified state becomes a dependable input to the next Northstar Retail construction action.

Exact file: docs/data_lineage.md

Purpose: project documentation.

Inputs: The requirements, configuration, source data, or upstream objects described in Phase 21.

Expected outputs: The file's declared objects, logs, tables, checks, or documentation when the user later runs or reads it.

```
# Data Lineage

Lineage answers, "Where did this number come from?" The project records technical lineage through source names, file paths, batch IDs, load
timestamps, record hashes, task order, source-to-target mapping, and reconciliation results.

## Example: Total Revenue

1. `SQLSERVER_ERP.erp.order_items.quantity`, `unit_price`, and `discount_amount` are extracted to a batch Parquet file.
2. Bronze preserves source values and adds `source_file`, `batch_id`, `ingested_at_utc`, and `record_hash`.
3. Silver casts numeric fields, quarantines quantity `<= 0`, joins valid order context, and derives `net_sales_amount`.
4. Gold stores one row per valid order item in `fact_sales` and resolves dimension keys.
5. The local publisher stages and transactionally loads `dw.fact_sales`.
6. Power BI measure `[Total Revenue]` sums `fact_sales[net_sales_amount]` under the current filter context.
7. The SQL validation query independently sums the same column.

![[Lineage diagram](images/lineage.svg)]

## Evidence to retain per run

- Local extraction `batch_manifest.json` with row counts and SHA-256 checksums.
- Databricks job run ID and task logs.
- Bronze/Silver/Gold row-count and rejection results.
- `quality.test_results` rows.
- Gold export manifest.
- SQL Server `audit.etl_batch` and `audit.reconciliation_result` rows.
- Power BI refresh timestamp and validation screenshot.
```

Line-by-line explanation

- **Line 1:** # Data Lineage is a comment for a human reader; it normally does not change data or execute business logic.
- **Line 2:** blank line used only to separate logical sections for readability.
- **Line 3:** Lineage answers, "Where did this number come from?" The project records technical lineage through source names, file paths, batch IDs, load timestamps, record hashes, task order, source-to-target mapping, and reconciliation results. — Lineage is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; answers is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; , is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; Where is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; did is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; this is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; number is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; come is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; from is a name, keyword, argument, identifier, or literal whose project-specific role is

described in the surrounding explanation; The is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; project is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; records is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; remaining punctuation and identifiers continue the same statement.

- **Line 4:** blank line used only to separate logical sections for readability.
- **Line 5:** `##` Example: Total Revenue is a comment for a human reader; it normally does not change data or execute business logic.
- **Line 6:** blank line used only to separate logical sections for readability.
- **Line 7:** 1. `\SQLSERVER_ERP.erp.order_items.quantity`, `unit_price`, and `discount_amount`` are extracted to a batch Parquet file.–1 is a numeric literal used by the command or expression; is a path, relative location, branch-style name, or file argument; verify every character before running it; `SQLSERVER_ERP.erp.order_items.quantity` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `unit_price` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; and is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `discount_amount` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `are` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `extracted` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `to` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `a`` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; remaining punctuation and identifiers continue the same statement.
- **Line 8:** 2. Bronze preserves source values and adds `\_source_file`, `_batch_id`, `_ingested_at_utc`, and `_record_hash``.–2 is a numeric literal used by the command or expression; is a path, relative location, branch-style name, or file argument; verify every character before running it; `Bronze` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `preserves` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `source` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `values` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; and is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `adds` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `_source_file` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `_batch_id` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; ``` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; remaining punctuation and identifiers continue the same statement.
- **Line 9:** 3. Silver casts numeric fields, quarantines quantity `\<= 0``, joins valid order context, and derives ``net_sales_amount``.–3 is a numeric literal used by the command or expression; is a path, relative location, branch-style name, or file argument; verify every character before running it; `Silver` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `casts` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `numeric` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `fields` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `quarantines` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `quantity` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `<=` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `0` is a numeric literal used by the command or expression; ``` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; remaining punctuation and identifiers continue the same statement.

- **Line 10:** 4. Gold stores one row per valid order item in `\fact_sales` and resolves dimension keys.—4 is a numeric literal used by the command or expression; . is a path, relative location, branch-style name, or file argument; verify every character before running it; Gold is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; Stores is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; one is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; row is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; per is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; valid is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; order is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; item is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; in is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `fact_sales` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; remaining punctuation and identifiers continue the same statement.
- **Line 11:** 5. The local publisher stages and transactionally loads `\dw.fact_sales`.—5 is a numeric literal used by the command or expression; . is a path, relative location, branch-style name, or file argument; verify every character before running it; The is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; local is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; publisher is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; stages is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; and is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; transactionally is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; loads is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `dw.fact_sales` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; . is a path, relative location, branch-style name, or file argument; verify every character before running it
- **Line 12:** 6. Power BI measure `\[Total Revenue]` sums `\fact_sales[net_sales_amount]` under the current filter context.—6 is a numeric literal used by the command or expression; . is a path, relative location, branch-style name, or file argument; verify every character before running it; Power is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; BI is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; measure is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; [is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; Total is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; Revenue is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation;] is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; sums is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `fact_sales` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; [is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; net_sales_amount is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation;] is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; remaining punctuation and identifiers continue the same statement.
- **Line 13:** 7. The SQL validation query independently sums the same column. — 7 is a numeric literal used by the command or expression; . is a path, relative location, branch-style name, or file argument; verify every character before running it; The is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; SQL is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; validation is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; query is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; independently is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; sums is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; the is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; same is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; column is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; . is a path, relative location, branch-style name, or file argument; verify every character before running it

- **Line 14:** blank line used only to separate logical sections for readability.
- **Line 15:** `![Lineage diagram](images/lineage.svg)` — `[` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `Lineage` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `diagram` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `]` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `images` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `/` is a path, relative location, branch-style name, or file argument; verify every character before running it; `lineage.svg` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `)` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation

[Back to the Phase 21 lesson index](#)

What your screen should look like now

- Every Phase 21 file you actually created appears under the correct parent folder.
- Your open editor tab matches the file you are validating.
- The Git branch has not changed unexpectedly.
- `git status --short` lists only expected work.
- Reference answers remain reference material; your status fields are not automatically completed.

Lesson 21.3 completion checklist

☐

docs/interview_walkthrough.md was created by me, saved, located correctly, and inspected — [STATUS]

☐

docs/claim_to_evidence_map.md was created by me, saved, located correctly, and inspected — [STATUS]

☐

docs/data_lineage.md was created by me, saved, located correctly, and inspected — [STATUS]

Safe stopping point

Save every open file with Ctrl+S. You may close VS Code only after `git status --short` is recorded in your journal. The terminal may be closed when no installer, transaction, Python process, Databricks run, warehouse load, or Power BI refresh is active. Resume at [Lesson 21.4](#) and recheck the root and branch.

Lesson 21.4 — Build and validate required objects

What your screen should look like before starting

The phase files are saved, the correct application and connection are visible, and the upstream input has passed its verification gate. Build one object at a time; do not create many objects and inspect them only at the end.

Action 21.4.G1 — Inspect the current state without changing it

Application:

VS Code

Window or panel:

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

Starting condition:

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

Current folder or location:

The repository root C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username.

What you are about to do:

Inspect the current state without changing it. This is one bounded construction or inspection task.

Why this action comes now:

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

Exact physical actions:

1. Record the exact starting folders, branch, versions, connections, settings, counts, or evidence.
2. Inspect the result.
3. Record the actual value.
4. Continue only after verification.

Command or code:

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

Where to enter it:

VS Code. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

What each part means:

1. Record the exact starting folders, branch, versions, connections, settings, counts, or evidence.
2. Inspect the result.
3. Record the actual value.
4. Continue only after verification.

What should happen:

A visible file, folder, branch, connection, table, notebook, task, relationship, measure, visual, or verification result should appear exactly where the action predicts.

Expected example:

Your exact values may differ. The expected result is the same *type* of object and the same required status, not necessarily the same timestamps, row counts, colors, generated IDs, or screen dimensions.

What may look different:

Menu wording can vary by product release or account tier. Use the official-source register and look for the described object rather than guessing from an old screenshot.

How to verify success:

Reopen or refresh the relevant panel, locate the named object, and inspect the property or output that proves it exists and is in the intended location.

Do not continue unless:

You can point to the visible result and explain what it proves. Mark the action VERIFIED BY USER only after that check.

Common mistake:

Combining several clicks or decisions, choosing a similarly named object, or continuing because no error dialog appeared.

Exact recovery:

Stop at the current screen. Save a screenshot of the error if useful, hide sensitive values, and compare the selected location

with the starting condition. Use Back or Cancel rather than Delete or Overwrite. Correct one mismatch and repeat only this action.

What you just accomplished:

You completed one observable piece of the Northstar Retail platform and established a checkpoint that can be audited later.

How this connects to the project:

The resulting object, decision, or evidence becomes an input to the next stage in the source-to-consumption chain.

[Back to the Phase 21 lesson index](#)

Action 21.4.G2 — Create the smallest required object or decision

Application:

Visual Studio Code

Window or panel:

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

Starting condition:

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

Current folder or location:

The repository root C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username.

What you are about to do:

Create the smallest required object or decision. This is one bounded construction or inspection task.

Why this action comes now:

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

Exact physical actions:

1. Use the phase file tutorial and one bounded action card.
2. Inspect the result.
3. Record the actual value.
4. Continue only after verification.

Command or code:

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

Where to enter it:

Visual Studio Code. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

What each part means:

1. Use the phase file tutorial and one bounded action card.
2. Inspect the result.
3. Record the actual value.
4. Continue only after verification.

What should happen:

A visible file, folder, branch, connection, table, notebook, task, relationship, measure, visual, or verification result should appear exactly where the action predicts.

Expected example:

Your exact values may differ. The expected result is the same *type* of object and the same required status, not necessarily the same timestamps, row counts, colors, generated IDs, or screen dimensions.

What may look different:

Menu wording can vary by product release or account tier. Use the official-source register and look for the described object rather than guessing from an old screenshot.

How to verify success:

Reopen or refresh the relevant panel, locate the named object, and inspect the property or output that proves it exists and is in the intended location.

Do not continue unless:

You can point to the visible result and explain what it proves. Mark the action VERIFIED BY USER only after that check.

Common mistake:

Combining several clicks or decisions, choosing a similarly named object, or continuing because no error dialog appeared.

Exact recovery:

Stop at the current screen. Save a screenshot of the error if useful, hide sensitive values, and compare the selected location with the starting condition. Use Back or Cancel rather than Delete or Overwrite. Correct one mismatch and repeat only this action.

What you just accomplished:

You completed one observable piece of the Northstar Retail platform and established a checkpoint that can be audited later.

How this connects to the project:

The resulting object, decision, or evidence becomes an input to the next stage in the source-to-consumption chain.

Action 21.4.G3 — Run the phase-specific verification

Application:

VS Code

Window or panel:

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

Starting condition:

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

Current folder or location:

The repository root C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username.

What you are about to do:

Run the phase-specific verification. This is one bounded construction or inspection task.

Why this action comes now:

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

Exact physical actions:

1. Compare actual output with the required condition and record differences.
2. Inspect the result.
3. Record the actual value.
4. Continue only after verification.

Command or code:

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

Where to enter it:

VS Code. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

What each part means:

1. Compare actual output with the required condition and record differences.
2. Inspect the result.
3. Record the actual value.
4. Continue only after verification.

What should happen:

A visible file, folder, branch, connection, table, notebook, task, relationship, measure, visual, or verification result should appear exactly where the action predicts.

Expected example:

Your exact values may differ. The expected result is the same *type* of object and the same required status, not necessarily the same timestamps, row counts, colors, generated IDs, or screen dimensions.

What may look different:

Menu wording can vary by product release or account tier. Use the official-source register and look for the described object rather than guessing from an old screenshot.

How to verify success:

Reopen or refresh the relevant panel, locate the named object, and inspect the property or output that proves it exists and is in the intended location.

Do not continue unless:

You can point to the visible result and explain what it proves. Mark the action VERIFIED BY USER only after that check.

Common mistake:

Combining several clicks or decisions, choosing a similarly named object, or continuing because no error dialog appeared.

Exact recovery:

Stop at the current screen. Save a screenshot of the error if useful, hide sensitive values, and compare the selected location with the starting condition. Use Back or Cancel rather than Delete or Overwrite. Correct one mismatch and repeat only this action.

What you just accomplished:

You completed one observable piece of the Northstar Retail platform and established a checkpoint that can be audited later.

How this connects to the project:

The resulting object, decision, or evidence becomes an input to the next stage in the source-to-consumption chain.

[Back to the Phase 21 lesson index](#)

Action 21.4.G4 — Demonstrate one safe failure or alternate-result branch

Application:

VS Code

Window or panel:

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

Starting condition:

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

Current folder or location:

The repository root C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username.

What you are about to do:

Demonstrate one safe failure or alternate-result branch. This is one bounded construction or inspection task.

Why this action comes now:

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

Exact physical actions:

1. Use a toy/disposable case and prove recovery without damaging verified work.
2. Inspect the result.
3. Record the actual value.
4. Continue only after verification.

Command or code:

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

Where to enter it:

VS Code. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

What each part means:

1. Use a toy/disposable case and prove recovery without damaging verified work.
2. Inspect the result.
3. Record the actual value.
4. Continue only after verification.

What should happen:

A visible file, folder, branch, connection, table, notebook, task, relationship, measure, visual, or verification result should appear exactly where the action predicts.

Expected example:

Your exact values may differ. The expected result is the same *type* of object and the same required status, not necessarily the same timestamps, row counts, colors, generated IDs, or screen dimensions.

What may look different:

Menu wording can vary by product release or account tier. Use the official-source register and look for the described object rather than guessing from an old screenshot.

How to verify success:

Reopen or refresh the relevant panel, locate the named object, and inspect the property or output that proves it exists and is in the intended location.

Do not continue unless:

You can point to the visible result and explain what it proves. Mark the action VERIFIED BY USER only after that check.

Common mistake:

Combining several clicks or decisions, choosing a similarly named object, or continuing because no error dialog appeared.

Exact recovery:

Stop at the current screen. Save a screenshot of the error if useful, hide sensitive values, and compare the selected location with the starting condition. Use Back or Cancel rather than Delete or Overwrite. Correct one mismatch and repeat only this action.

What you just accomplished:

You completed one observable piece of the Northstar Retail platform and established a checkpoint that can be audited later.

How this connects to the project:

The resulting object, decision, or evidence becomes an input to the next stage in the source-to-consumption chain.

[Back to the Phase 21 lesson index](#)

Action 21.4.G5 — Record evidence and prepare the downstream handoff

Application:

VS Code

Window or panel:

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

Starting condition:

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

Current folder or location:

The repository root C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username.

What you are about to do:

Record evidence and prepare the downstream handoff. This is one bounded construction or inspection task.

Why this action comes now:

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

Exact physical actions:

1. Save the verified input that the next phase consumes.
2. Inspect the result.
3. Record the actual value.
4. Continue only after verification.

Command or code:

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

Where to enter it:

VS Code. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

What each part means:

1. Save the verified input that the next phase consumes.
2. Inspect the result.
3. Record the actual value.
4. Continue only after verification.

What should happen:

A visible file, folder, branch, connection, table, notebook, task, relationship, measure, visual, or verification result should appear exactly where the action predicts.

Expected example:

Your exact values may differ. The expected result is the same *type* of object and the same required status, not necessarily the same timestamps, row counts, colors, generated IDs, or screen dimensions.

What may look different:

Menu wording can vary by product release or account tier. Use the official-source register and look for the described object rather than guessing from an old screenshot.

How to verify success:

Reopen or refresh the relevant panel, locate the named object, and inspect the property or output that proves it exists and is in the intended location.

Do not continue unless:

You can point to the visible result and explain what it proves. Mark the action VERIFIED BY USER only after that check.

Common mistake:

Combining several clicks or decisions, choosing a similarly named object, or continuing because no error dialog appeared.

Exact recovery:

Stop at the current screen. Save a screenshot of the error if useful, hide sensitive values, and compare the selected location with the starting condition. Use Back or Cancel rather than Delete or Overwrite. Correct one mismatch and repeat only this action.

What you just accomplished:

You completed one observable piece of the Northstar Retail platform and established a checkpoint that can be audited later.

How this connects to the project:

The resulting object, decision, or evidence becomes an input to the next stage in the source-to-consumption chain.

[Back to the Phase 21 lesson index](#)

What your screen should look like now

- The new Phase 21 objects are visible in their owning application.
- The current branch remains the intended feature branch.
- The current database, catalog, schema, Power BI model, or GitHub run is still identifiable.
- Verification output is visible or recorded; no object is marked complete solely because creation code was displayed.
- Any failed toy demonstration has been repaired or isolated.

Lesson 21.4 completion checklist

☐

Every required object was built separately — [STATUS]

☐

Every object has a declared responsibility/grain — [STATUS]

☐

Inputs and outputs were inspected — [STATUS]

☐

A rerun or alternate-result branch was tested where applicable — [STATUS]

☐

Counts, keys, measures, relationships, or settings were independently validated — [STATUS]

☐

I can explain one failure and its safest recovery — [STATUS]

Safe stopping point

Stop only after the active command, database transaction, Databricks cell/Job, Python process, warehouse load, or Power BI refresh finishes. Save all files and the Power BI project. Record uncommitted Git changes and exact resume action. Resume at [Lesson 21.5](#).

Lesson 21.5 — Verify, troubleshoot, commit, teach back, and stop safely

What your screen should look like before starting

The Phase 21 outputs are visible, all runs are finished, open files are saved, and you can state the active branch and execution context. Any error you encountered has a recorded message and has not been hidden by deleting evidence.

Design decision — Verification before automation

Question:

Should the phase prioritize a visible manual verification or jump directly to automation?

Options considered:

- Manual verification first, then automation.
- Automation without a known-good baseline.
- Manual operation forever.

Beginner path selected:

Establish one verified manual baseline and then automate repeatable checks.

Why this path was selected:

A known-good example makes failures interpretable and prevents automation from hiding a wrong assumption.

Tradeoff:

The first run takes longer.

What a company might do instead:

Teams often pair infrastructure as code and automated tests with controlled bootstrap and acceptance procedures.

How to explain this in an interview:

I established a verified baseline, then encoded the same contract in tests and orchestration so automation preserved meaning rather than just speed.

If you see Result A

Every interview claim points to a verified object, result, commit, and tradeoff you can explain. Record the exact result, perform the named independent verification, and continue only when the gate is satisfied.

If you see Result B

A statement depends only on reference code or an unverified screenshot and cannot be claimed as completed. Treat this as information, not permission to delete or overwrite. Follow the branch-specific diagnostic in the current action, preserve evidence, and continue only after the state is understood.

If you see an error

Read the first meaningful error line, redact secrets, and verify the application, path, branch, server/database, catalog/schema, batch ID, parameters, version/tier, and object name. Run the smallest observational check first. Do not reset Git history, drop data, disable a rule, force-push, or replace the target merely to make the error disappear.

Phase-specific verification gate

☐

Required files/objects exist in the exact location.

☐

I personally created or configured them.

☐

I ran the phase commands in the documented context.

☐

I inspected the output rather than relying on a green icon alone.

☐

Counts, keys, relationships, measures, checksums, statuses, or settings meet the declared contract.

☐

Same-batch/rerun behavior is known where applicable.

☐

A controlled failure or realistic alternate-result branch was tested safely where applicable.

☐

No password, token, or secret appears in tracked files, screenshots, notebook output, terminal history pasted into documentation, or staged changes.

☐

Actual verified result: [ENTER VERIFIED RESULT].

Point-of-failure troubleshooting record

Exact or representative error message:

[PASTE THE FIRST MEANINGFUL ERROR, WITH SECRETS REDACTED]

What it means in plain language:

[WRITE YOUR INTERPRETATION]

Most likely cause:

[WRITE ONE TESTABLE HYPOTHESIS]

What not to do:

Do not delete data, drop databases, reset Git history, force-push, disable constraints, edit raw evidence, change a quality threshold, or expose credentials merely to make the symptom disappear.

First diagnostic action:

[ENTER THE SMALLEST OBSERVATIONAL CHECK]

How to read the diagnostic result:

[RESULT A MEANS... / RESULT B MEANS...]

Safest fix:

[ENTER THE NARROW FIX]

Alternative fix when applicable:

[ENTER OR N/A]

How to verify the fix:

[ENTER THE INDEPENDENT RECHECK]

How to return to the main tutorial:

Resume at the exact action number that failed; do not skip its verification gate.

Screenshot checkpoint

Application(s) that should be visible: VS Code, the completed workbook journal, repository evidence, and a timer.

Window/panel: Show claim-to-evidence worksheet and timed explanation notes.

Sensitive information to hide: Passwords, tokens, connection strings, email addresses, cloud account IDs, unnecessary Windows profile details, and any secret revealed by an error.

Include: The object name, batch/run ID when relevant, result/status, and enough surrounding UI to prove which application and layer is shown.

Crop out: Unrelated desktop windows, notification previews, bookmarks, chat, and empty background.

Recommended filename: docs/images/phase21_prepare-interview-explanations-and-defend-every-design-_verified.png.

Recommended repository folder: docs/images/.

README placement: The section describing Phase 21's verified result; do not use the image before the result is actually verified.

What it proves: The visible state existed under the shown context. It does not prove hidden rows, other batches, every filter combination, or a later run.

[ADD YOUR VERIFIED SCREENSHOT HERE]

Git checkpoint after the verified Phase 21 changes

Do not use `git add .` until you understand that it stages every matching change under the current directory, including files you did not intend. Prefer targeted staging after inspecting status and diffs.

Save open work

1. PRESS: In VS Code, press Ctrl+K, then S if you use **Save All**, or press Ctrl+S in every modified editor.
2. In Power BI, press Ctrl+S and confirm the local file location.
3. Wait for database, Python, Databricks, and refresh operations to finish; Git does not capture uncommitted database/cloud state.

Action 21.5.G1 — Verify the repository root before Git operations

Application:

Windows PowerShell or the VS Code PowerShell terminal

Window or panel:

VS Code integrated PowerShell terminal

Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

Current folder or location:

The repository root C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username.

What you are about to do:

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

Exact physical actions:

1. CLICK: Bring **Windows PowerShell or the VS Code PowerShell terminal** to the front.
2. LOOK FOR: Confirm the current location matches The repository root C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.

4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

Command or code (PowerShell):

```
git rev-parse --show-toplevel
```

Where to enter it:

VS Code integrated PowerShell terminal. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

What each part means:

- **Line 1:** `git rev-parse --show-toplevel` — `git` calls the Git version-control program; `rev-parse` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `--show` is a command option or flag; its exact behavior is defined beside the command; `-toplevel` is a command option or flag; its exact behavior is defined beside the command

Does it change anything?

This is intended to inspect or validate state rather than change it.

Is it safe to rerun?

Normally safe to rerun because it is observational, but still confirm the execution location first.

What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

Do not continue unless:

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

Common mistake:

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

Exact recovery:

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

What you just accomplished:

You executed and checked one controlled operation rather than treating a long script as a black box.

How this connects to the project:

This verified state becomes a dependable input to the next Northstar Retail construction action.

Action 21.5.G2 — Verify the active Git branch

Application:

Windows PowerShell or the VS Code PowerShell terminal

Window or panel:

VS Code integrated PowerShell terminal

Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

Current folder or location:

The repository root C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username.

What you are about to do:

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

Exact physical actions:

1. CLICK: Bring **Windows PowerShell or the VS Code PowerShell terminal** to the front.
2. LOOK FOR: Confirm the current location matches The repository root C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

Command or code (PowerShell):

```
git branch --show-current
```

Where to enter it:

VS Code integrated PowerShell terminal. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

What each part means:

- **Line 1:** `git branch --show-current` — `git` calls the Git version-control program; `branch` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `--show` is a command option or flag; its exact behavior is defined beside the command; `-current` is a command option or flag; its exact behavior is defined beside the command

Does it change anything?

This is intended to inspect or validate state rather than change it.

Is it safe to rerun?

Normally safe to rerun because it is observational, but still confirm the execution location first.

What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

Do not continue unless:

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

Common mistake:

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

Exact recovery:

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

What you just accomplished:

You executed and checked one controlled operation rather than treating a long script as a black box.

How this connects to the project:

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 21 lesson index](#)

Action 21.5.G3 — Inspect all current Git changes

Application:

Windows PowerShell or the VS Code PowerShell terminal

Window or panel:

VS Code integrated PowerShell terminal

Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

Current folder or location:

The repository root `C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project`. The User segment is an example; verify your real Windows username.

What you are about to do:

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

Exact physical actions:

1. CLICK: Bring **Windows PowerShell or the VS Code PowerShell terminal** to the front.
2. LOOK FOR: Confirm the current location matches The repository root `C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project`. The User segment is an example; verify your real Windows username. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.

4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

Command or code (PowerShell):

```
git status --short
```

Where to enter it:

VS Code integrated PowerShell terminal. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

What each part means:

- **Line 1:** `git status --short` — `git` calls the Git version-control program; `status` shows tracked, staged, modified, and untracked work; `--short` is a command option or flag; its exact behavior is defined beside the command

Does it change anything?

This is intended to inspect or validate state rather than change it.

Is it safe to rerun?

Normally safe to rerun because it is observational, but still confirm the execution location first.

What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

Do not continue unless:

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

Common mistake:

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

Exact recovery:

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

What you just accomplished:

You executed and checked one controlled operation rather than treating a long script as a black box.

How this connects to the project:

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 21 lesson index](#)

Interpret `git status --short`

- ?? means untracked: Git sees a new path but it is not staged.
- M means modified in the working tree but not staged.
- M means the staged version differs from the last commit.
- MM means a staged version exists and the file has additional unstaged edits.
- A means staged as a new file.
- D means deletion; stop and investigate unless deletion is deliberate.
- R means rename; inspect both old and new paths.
- A blank result means the working tree is clean. It does not prove database, Databricks, or Power BI work occurred.

Action 21.5.G4 — Inspect the unstaged diff for `docs/interview_walkthrough.md`

Application:

Windows PowerShell or the VS Code PowerShell terminal

Window or panel:

VS Code integrated PowerShell terminal

Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

Current folder or location:

The repository root `C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project`. The User segment is an example; verify your real Windows username.

What you are about to do:

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

Exact physical actions:

1. CLICK: Bring **Windows PowerShell or the VS Code PowerShell terminal** to the front.
2. LOOK FOR: Confirm the current location matches The repository root `C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project`. The User segment is an example; verify your real Windows username. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

Command or code (PowerShell):

```
git diff -- "docs/interview_walkthrough.md"
```

Where to enter it:

VS Code integrated PowerShell terminal. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

What each part means:

- **Line 1:** `git diff -- "docs/interview_walkthrough.md"` — `git` calls the Git version-control program; `diff` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `--` is a command option or flag; its exact behavior is defined beside the command; `"docs/interview_walkthrough.md"` is a path, relative location, branch-style name, or file argument; verify every character before running it

Does it change anything?

This is intended to inspect or validate state rather than change it.

Is it safe to rerun?

Normally safe to rerun because it is observational, but still confirm the execution location first.

What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

Do not continue unless:

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

Common mistake:

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

Exact recovery:

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

What you just accomplished:

You executed and checked one controlled operation rather than treating a long script as a black box.

How this connects to the project:

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 21 lesson index](#)

Action 21.5.G5 — Stage only the reviewed file docs/interview_walkthrough.md

Application:

Windows PowerShell or the VS Code PowerShell terminal

Window or panel:

VS Code integrated PowerShell terminal

Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

Current folder or location:

The repository root `C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project`. The User segment is an example; verify your real Windows username.

What you are about to do:

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

Exact physical actions:

1. CLICK: Bring **Windows PowerShell or the VS Code PowerShell terminal** to the front.
2. LOOK FOR: Confirm the current location matches The repository root C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

Command or code (PowerShell):

```
git add -- "docs/interview_walkthrough.md"
```

Where to enter it:

VS Code integrated PowerShell terminal. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

What each part means:

- **Line 1:** `git add -- "docs/interview_walkthrough.md"` — `git` calls the Git version-control program; `add` moves selected changes into the staging area; `--` is a command option or flag; its exact behavior is defined beside the command; `"docs/interview_walkthrough.md"` is a path, relative location, branch-style name, or file argument; verify every character before running it

Does it change anything?

This can change files, Git state, packages, database objects, or data.

Is it safe to rerun?

Safe to rerun only after reading the idempotency note and confirming that the same batch, file, or object will not be duplicated.

What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

Do not continue unless:

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

Common mistake:

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

Exact recovery:

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

What you just accomplished:

You executed and checked one controlled operation rather than treating a long script as a black box.

How this connects to the project:

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 21 lesson index](#)

For every additional intended path, run a separate targeted `git add -- "path"` after its diff is reviewed. Never stage `.env`, generated raw batches, credentials, tokens, local database files, or an unverified Power BI artifact.

Action 21.5.G6 — Inspect the staged diff

Application:

Windows PowerShell or the VS Code PowerShell terminal

Window or panel:

VS Code integrated PowerShell terminal

Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

Current folder or location:

The repository root `C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project`. The User segment is an example; verify your real Windows username.

What you are about to do:

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

Exact physical actions:

1. CLICK: Bring **Windows PowerShell or the VS Code PowerShell terminal** to the front.
2. LOOK FOR: Confirm the current location matches The repository root `C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project`. The User segment is an example; verify your real Windows username. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

Command or code (PowerShell):

```
git diff --cached
```

Where to enter it:

VS Code integrated PowerShell terminal. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

What each part means:

- **Line 1:** `git diff --cached` — `git` calls the Git version-control program; `diff` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `--cached` is a command option or flag; its exact behavior is defined beside the command

Does it change anything?

This is intended to inspect or validate state rather than change it.

Is it safe to rerun?

Normally safe to rerun because it is observational, but still confirm the execution location first.

What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

Do not continue unless:

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

Common mistake:

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

Exact recovery:

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

What you just accomplished:

You executed and checked one controlled operation rather than treating a long script as a black box.

How this connects to the project:

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 21 lesson index](#)

Action 21.5.G7 — Create the Phase 21 commit

Application:

Windows PowerShell or the VS Code PowerShell terminal

Window or panel:

VS Code integrated PowerShell terminal

Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

Current folder or location:

The repository root `C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project`. The User segment is an example; verify your real Windows username.

What you are about to do:

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

Exact physical actions:

1. CLICK: Bring **Windows PowerShell or the VS Code PowerShell terminal** to the front.
2. LOOK FOR: Confirm the current location matches The repository root C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

Command or code (PowerShell):

```
git commit -m "docs: add interview design-defense guide"
```

Where to enter it:

VS Code integrated PowerShell terminal. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

What each part means:

- **Line 1:** `git commit -m "docs: add interview design-defense guide"` — `git` calls the Git version-control program; `commit` records the staged snapshot; `-m` asks Python to run an installed module; `"docs: add interview design-defense guide"` is a quoted literal; the quotation marks preserve spaces or mark text

Does it change anything?

This can change files, Git state, packages, database objects, or data.

Is it safe to rerun?

Safe to rerun only after reading the idempotency note and confirming that the same batch, file, or object will not be duplicated.

What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

Do not continue unless:

The result is visible, understandable, and recorded as RUN BY USER or VERIFIED BY USER. Displaying this workbook does not count as execution.

Common mistake:

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

Exact recovery:

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

What you just accomplished:

You executed and checked one controlled operation rather than treating a long script as a black box.

How this connects to the project:

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 21 lesson index](#)

Action 21.5.G8 — Verify the new commit

Application:

Windows PowerShell or the VS Code PowerShell terminal

Window or panel:

VS Code integrated PowerShell terminal

Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

Current folder or location:

The repository root C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username.

What you are about to do:

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

Exact physical actions:

1. CLICK: Bring **Windows PowerShell or the VS Code PowerShell terminal** to the front.
2. LOOK FOR: Confirm the current location matches The repository root C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

Command or code (PowerShell):

```
git log -1 --oneline --decorate
```

Where to enter it:

VS Code integrated PowerShell terminal. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

What each part means:

- **Line 1:** `git log -1 --oneline --decorate` — `git` calls the Git version-control program; `log` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `-1` is a command option or flag; its exact behavior is defined beside the command; `--oneline` is a command option or flag; its exact behavior is defined beside the command; `--decorate` is a command option or flag; its exact behavior is defined beside the command

Does it change anything?

This is intended to inspect or validate state rather than change it.

Is it safe to rerun?

Normally safe to rerun because it is observational, but still confirm the execution location first.

What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

Do not continue unless:

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

Common mistake:

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

Exact recovery:

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

What you just accomplished:

You executed and checked one controlled operation rather than treating a long script as a black box.

How this connects to the project:

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 21 lesson index](#)

Action 21.5.G9 — Push the feature branch and set upstream

Application:

Windows PowerShell or the VS Code PowerShell terminal

Window or panel:

VS Code integrated PowerShell terminal

Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

Current folder or location:

The repository root C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username.

What you are about to do:

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

Exact physical actions:

1. CLICK: Bring **Windows PowerShell or the VS Code PowerShell terminal** to the front.
2. LOOK FOR: Confirm the current location matches The repository root C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

Command or code (PowerShell):

```
git push -u origin "$(git branch --show-current)"
```

Where to enter it:

VS Code integrated PowerShell terminal. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

What each part means:

- **Line 1:** `git push -u origin "$(git branch --show-current)"` — `git` calls the Git version-control program; `push` sends local commits to a remote repository; `-u` is a command option or flag; its exact behavior is defined beside the command; `origin` the conventional name of the GitHub remote; `"$(git branch --show-current)"` is a quoted literal; the quotation marks preserve spaces or mark text

Does it change anything?

This can change files, Git state, packages, database objects, or data.

Is it safe to rerun?

Safe to rerun only after reading the idempotency note and confirming that the same batch, file, or object will not be duplicated.

What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row

count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

Do not continue unless:

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

Common mistake:

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

Exact recovery:

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

What you just accomplished:

You executed and checked one controlled operation rather than treating a long script as a black box.

How this connects to the project:

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 21 lesson index](#)

Verify on GitHub

1. CLICK: Open the repository page in a browser.
2. CLICK: Open the branch selector above the file list.
3. TYPE THIS: The exact branch name returned locally.
4. CLICK: Select that branch.
5. LOOK FOR: The latest commit message docs: add interview design-defense guide and the intended changed paths.
6. CLICK: Open each changed file and confirm the GitHub version matches the staged diff.
7. Do not merge solely because the push succeeded; CI and review must pass.

Push-rejected recovery

If Git says the remote contains work you do not have, do not use `--force`. Run `git fetch origin`, inspect `git log --oneline --graph --decorate --all -20`, then rebase or merge only after understanding the divergence. Resolve conflicts one file at a time, run tests again, and push normally. A rejection protects remote work; it is not permission to overwrite it.

Explain it in your own words

Without copying the model answer, explain:

1. What you created or configured in Phase 21.
2. Why it exists.
3. Where it is located on your computer, in a database, in Databricks, in Power BI, or on GitHub.
4. What information enters it.
5. What information leaves it.
6. How it connects to the next phase.
7. How you verified it.
8. What could cause it to fail.
9. Which decision/tradeoff you could defend in an interview.

My answer

[WRITE YOUR ANSWER BEFORE READING THE REFERENCE]

OPTIONAL REFERENCE ANSWER — PHASE 21 TEACH-BACK MODEL

Read this only after completing **MY TASK** and using the three hints in order. The model is a learning reference, not evidence of your execution.

"Phase 21 created the verified boundary described by **Prepare interview explanations and defend every design choice**. It consumes only the outputs accepted from earlier phases, produces a named and auditable handoff, and records enough metadata and tests to detect wrong context, missing data, duplicates, failed rules, or unsafe reruns. I verified the result in its owning application and connected the evidence to Git without claiming that displayed instructions were executed."

Mini quiz

1. Multiple choice: Why does Phase 21 occur at this point in the source-to-consumption chain? A) Because menu order is arbitrary. B) Because its verified upstream input now exists. C) Because later phases do not depend on it. D) To create portfolio screenshots before validation.
 2. True or false: A command that displays no error is automatically verified even when it ran in the wrong folder, database, catalog, schema, branch, or filter context.
 3. Fill in the blank: The statement that defines what one row represents is the table or entity _____.
 4. What command would you use first to confirm the PowerShell current folder before a repository command?
 5. Troubleshooting: Your output differs from the example. What should you check before deleting, overwriting, resetting, force-pushing, or weakening a test?
 6. Design choice: Explain one tradeoff of Track A and one production alternative.
 7. Code reading: Why are input, accepted, rejected, and deduplicated counts recorded separately?
 8. Ownership: Which status may you select only after personally performing and inspecting the verification?
-

Mini quiz answer key and explanations

1. **B.** This phase is ordered after its prerequisites so its output has a trustworthy input. A is wrong because order is intentional; C is wrong because later phases depend on the handoff; D is wrong because screenshots follow verification.
2. **False.** Lack of an error proves only that the application accepted something; context and independent verification still matter.
3. **Grain.** Grain is the precise meaning of one row. A key identifies a row, but it does not by itself state the row's business meaning.
4. **Get-Location.** It shows the shell's current folder. `git rev-parse --show-toplevel` separately verifies the repository root when inside a clone.
5. Check application, folder/path, branch, server/database, catalog/schema, batch ID, parameters, source/target grain, filter context, version/tier differences, and the first meaningful error. Destructive changes are not a diagnostic step.
6. Track A has manual upload/download boundaries and batch latency. A production alternative is routable private connectivity with cloud object storage/managed warehouse, identities, and automated orchestration.
7. Separate counts make every row outcome explainable. A single final count can hide silent drops, duplicates, or records that moved to quarantine.
8. **Verified by me / VERIFIED BY USER.** `PLANNED`, `CREATED BY USER`, and `RUN BY USER` describe earlier states; only inspected evidence supports verification.

[WRITE YOUR ANSWER]

What your screen should look like now

- The phase output and final validation are saved or visible.
- The intended feature branch is still active.
- `git status` is either clean after the commit or lists only deliberately deferred work recorded in the journal.
- The branch exists on GitHub after a successful push.
- No database transaction, Databricks run, loader, test process, or Power BI refresh is still active.
- The next phase's required input is identifiable.

Lesson 21.5 completion checklist

☐

I completed the verification gate with my actual results — [STATUS]

☐

I recorded at least one realistic failure, alternate result, or diagnostic path — [STATUS]

☐

I captured and redacted the required screenshot only after verification — [STATUS]

☐

I reviewed, staged, committed, pushed, and verified only the intended Git changes — [STATUS]

☐

I completed the teach-back, quiz, answer review, and learning journal — [STATUS]

☐

I can name the exact verified handoff to the next phase — [STATUS]

Safe stopping point

All files must be saved. The terminal may be closed after the Git result is recorded. SSMS/pgAdmin may be closed after queries finish and transactions are committed/rolled back. Databricks compute may be stopped when no Job or notebook is running. Power BI may be closed after saving. Resume from the next phase's screen-start checklist and re-verify root, branch, connection, and latest accepted batch.

How this phase connects to the next phase

Phase 22 evaluates advanced alternatives only after the required path is stable.

Phase 21 completion checklist

☐

Phase goal explained in my own words — [STATUS]

☐

Required files/objects created by me — [STATUS]

☐

Commands run by me — [STATUS]

Output independently inspected — [STATUS]

Failure/alternate branch understood — [STATUS]

Screenshot captured and redacted — [STATUS]

Targeted Git commit exists — [STATUS]

Branch pushed and verified on GitHub — [STATUS]

Quiz completed before answer key — [STATUS]

Journal completed — [STATUS]

Final phase status manually set — [] Not started / [-] In progress / [x] Verified by me / [!] Needs troubleshooting

[Back to the master table of contents](#)

Phase 22 — Evaluate optional extensions without disrupting the required path

[Back to the master table of contents](#)

Track: Optional extensions only after Track A is verified

Status when first opened: PLANNED

Completion rule: The phase is not complete because its instructions exist. Mark it VERIFIED BY USER only after you perform the work, inspect the output, and save evidence.

Why this phase happens now

Earlier work this phase depends on: The complete required beginner path.

What would go wrong if it happened earlier: You would create objects without a verified requirement, valid upstream input, protected repository state, or known execution environment.

Later work that depends on it: No later required phase. Each extension has its own prerequisite and rollback decision.

Decision being made: Choose and verify the simplest local-first method that teaches the professional concept without pretending that local services are publicly reachable.

Alternatives: A company could use managed cloud databases, infrastructure as code, service principals, direct JDBC publication, deployment bundles, or streaming. Those options are discussed as tradeoffs, not substituted silently.

Beginner path selected: Track A: local SQL Server and PostgreSQL, Python batch extracts, manual governed upload to Databricks, Delta Bronze/Silver/Gold, manual verified export, local SQL Server warehouse, and Power BI Import.

Reason for the order: Requirements become source decisions; sources become generated data; source data becomes extraction batches; batches become Bronze; Bronze becomes Silver; Silver becomes Gold; Gold becomes warehouse and Power BI input.

Phase 22 lesson index

1. [Lesson 22.1 — Understand the phase and starting screen](#)
2. [Lesson 22.2 — Perform the notebook-guided actions one at a time](#)
3. [Lesson 22.3 — Create and understand the phase files](#)
4. [Lesson 22.4 — Build and validate required objects](#)
5. [Lesson 22.5 — Verify, troubleshoot, commit, teach back, and stop safely](#)

Lesson 22.1 — Understand the phase and starting screen

What your screen should look like before starting

- **Application open:** VS Code, architecture notes, cost notes, and whichever optional platform is being evaluated.
- **Window in front:** The application named by the first action; do not keep an installer, database editor, notebook, and Power BI dialog stacked ambiguously.
- **Repository folder:** C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project when repository work is required. Verify User on your computer.
- **Git branch:** A feature branch, not a detached commit. Run `git branch --show-current` and record the exact result.
- **Database/workspace connection:** The connection named in the action, not merely the most recent connection.
- **Files that should already exist:** Only files from verified earlier phases. Do not pre-create the full tree.
- **Files that should not exist yet:** New Phase 22 files remain absent until their creation lesson.
- **Terminal prompt:** It should end in the expected repository path or another explicitly named folder.
- **Previous verification:** Phase 21 must be verified when this phase has a prerequisite.

Three-level explanation of the phase

Level 1 — Child-simple explanation

Imagine building a store from labeled boxes. This phase handles one box, checks that the label is correct, and makes sure the next box receives the right thing. You do not pour all boxes together and hope the result is understandable.

Level 2 — Northstar Retail project explanation

Phase 22 creates the specific Northstar Retail files, database objects, transformations, tests, model objects, or evidence described in the lessons. Every output keeps a visible connection to its source and batch so you can trace an order, customer, product, campaign, return, shipment, or inventory record.

Level 3 — Professional explanation

This phase establishes a controlled boundary in an end-to-end batch platform. It defines contracts, execution context, idempotency behavior, quality expectations, evidence, and handoff artifacts so the downstream layer can be reproduced and reviewed independently.

Applications to open

VS Code, architecture notes, cost notes, and whichever optional platform is being evaluated. Open only the application needed for the immediate action. Extra windows increase the chance of typing a command into the wrong context.

Phase status gate

☐

I changed this phase from [] Not started to [-] In progress in the master tracker.

☐

I verified the repository root when repository work is required.

☐

I verified the current branch.

☐

I identified the exact server/database, Databricks workspace/catalog/schema, or Power BI file.

☐

I read the phase ordering explanation.

What your screen should look like now

- The Phase 22 lesson index, starting-screen checklist, and three explanation levels remain visible in this workbook.
- Only the applications required for the next lesson are open; no installer, database transaction, notebook run, or Power BI refresh was started merely to read orientation material.
- The intended repository path, active branch, server/database, Databricks workspace, or Power BI file has been written down when it applies.

- No new Phase 22 project file or object has been created yet unless the lesson explicitly instructed you to create it.
- The Phase 22 master-tracker row is marked [-] In progress only after you personally updated it.

Lesson 22.1 completion checklist

☐

I read why Phase 22 happens now — [STATUS]

☐

I can give the child-simple, Northstar-specific, and professional explanations — [STATUS]

☐

I identified the exact applications and execution context required next — [STATUS]

☐

I verified prerequisites instead of assuming they are complete — [STATUS]

☐

I updated the progress tracker myself — [STATUS]

Safe stopping point

No command, database transaction, Databricks run, loader, or Power BI refresh should be active after this orientation lesson. Save any journal note you created. You may close the workbook viewer and applications. When returning, reopen [Lesson 22.2](#), re-read its starting-screen checklist, and verify the repository root, branch, connection, and workspace before performing an action.

[Back to the Phase 22 lesson index](#)

Lesson 22.2 — Perform the notebook-guided actions one at a time

What your screen should look like before starting

The Phase 22 start gate is checked, only the needed application is in front, and the current context has been verified. The following retained lesson material preserves the Northstar terminology and exercise framing; the action cards then turn each hands-on step into a written screen-recording sequence.

Retained phase lesson, exercises, rules, and expected results

Track: Optional advanced extensions — not required for definition of done

Ownership status at start: Workbook instructions exist; your execution is not yet verified.

Evidence rule: Replace placeholders only after the verification steps pass.

1. What you are building

A decision guide and isolated backlog for streaming, CDC, Auto Loader, Lakeflow Declarative Pipelines, dbt, data contracts, data-quality frameworks, Infrastructure as Code, Declarative Automation Bundles, Azure Data Factory, Kafka, machine learning, forecasting, segmentation, slowly changing facts, row/role-level security, and cloud deployment.

2. Why it matters

Adding every popular technology makes a beginner project harder to finish and explain. Extensions should solve a measured limitation, preserve existing contracts, add tests/evidence, and remain clearly separate from the verified required path.

3. Words to know

Term	Plain-language definition
Extension	An optional capability added after the required platform is stable.
CDC	Change Data Capture: reading inserts, updates, and deletes from source change information.
Streaming	Continuously processing arriving events rather than scheduled finite batches.

Term	Plain-language definition
Auto Loader	Databricks cloudFiles ingestion for incrementally discovering files in cloud storage/volumes.
Lakeflow Declarative Pipelines	Databricks managed declarative pipeline framework; older materials may use Delta Live Tables naming.
dbt	A transformation/testing/documentation tool centered on SQL models and adapters.
Data contract	An agreed schema, semantics, quality, ownership, and change policy between producers and consumers.
Infrastructure as Code	Version-controlled definitions for infrastructure instead of manual-only creation.
Declarative Automation Bundles	Current Databricks project packaging/deployment approach; formerly called Asset Bundles.
Kafka	A distributed event-streaming platform used for durable event logs and real-time integration.
RLS	Row-level security: filtering rows based on the viewer identity/role.
Proof of concept	A bounded experiment that tests feasibility, not a production claim.
Exit criterion	A measurable condition for stopping, adopting, or rejecting an extension.

4. What must already be completed

Required Phases 0–21 are verified or accurately status-labeled, the current limitation is measured, and the extension will be built on a separate branch without breaking the batch baseline.

5. Applications to open

Application	How to open it	Why it is open
VS Code	Open docs/optional_extensions.md, risk register, and architecture.	Write the decision record and isolated design.
Official documentation in browser	Use links in the official source register near the beginning of this workbook and verify current account support/cost.	Avoid outdated names or unsupported tier assumptions.
Git/PowerShell	Create an extension branch and run baseline tests.	Keep optional experiments reversible.
Provider workspace only when chosen	Databricks/Azure/dbt/Kafka/Power BI as applicable.	Run one bounded proof of concept with cost/security controls.

6. Exact click-by-click steps

Beginner rhythm: Read the whole step. Confirm the application and location. Perform only that step. Verify the visible result. Record an error before attempting a fix.

7. Exact commands, one code block at a time

8. Where each command runs

Never infer the execution location from the code language. The command headings above identify the application and folder/database/catalog. Before every PowerShell command, run Get-Location; before SQL, verify the selected database; before Spark, print the catalog/schema/batch widgets.

TEACHING EXAMPLE

The following small example or reference pattern explains the concept before you attempt Northstar-specific work. Read it, then complete **MY TASK** without copying the answer.

Line-by-line code explanation

Line or action	Meaning	Why it belongs here
git switch main	Creates an isolated branch and records a green baseline.	An optional experiment must not silently break the core project.

Line or action	Meaning	Why it belongs here
# OPTIONAL POC — do not replace required Bronze until exit criteria pass.	Shows a bounded Auto Loader available-now pattern with explicit state locations.	The extension should first prove incremental discovery and replay behavior on one feed.
EXTENSION: TODO(USER)	Creates an evidence-based extension decision record.	Technology selection should be tied to a requirement and exit criteria.
python -m scripts.validation.check_required_files	Rechecks the baseline contract, security, tests, and extension scope.	Optional work must not reduce core reliability.

Current naming and selection notes (accessed 2026-08-16)

Databricks documentation describes Auto Loader as the `cloudFiles` source for incremental file ingestion and recommends it for many cloud-object/volume ingestion scenarios. Managed declarative pipelines are currently documented under Lakeflow Declarative Pipelines, while older learning material may say Delta Live Tables. Databricks project deployment documentation uses Declarative Automation Bundles, formerly Asset Bundles. These optional tools have account/cloud-specific features and costs, so re-check official documentation before implementation.

Extension priority rubric

Score business value, learning value, measured need, implementation effort, operating cost, security/network complexity, testability, and explainability. A low-score fashionable tool should wait. The required project is complete without any extension.

MY TASK

Select at most one extension, write a requirement and exit criteria, verify current official support, run a small isolated proof with baseline/replay/failure/cost tests, and document an adopt/revise/reject decision without changing the required project status prematurely.

STARTER SKELETON

```
PROBLEM (not tool): TODO(USER)
CURRENT BASELINE/EVIDENCE: TODO(USER)
TARGET SLA/BEHAVIOR: TODO(USER)
CANDIDATES: TODO(USER)
CHOSEN POC AND WHY: TODO(USER)
IN SCOPE: one source/table/path
OUT OF SCOPE: TODO(USER)
TESTS: initial, rerun, duplicate, failure, recovery, cost, security
EXIT CRITERIA: TODO(USER)
ROLLBACK: TODO(USER)
FINAL DECISION: TODO(USER)
```

Acceptance criteria: The extension starts from a measured problem; current official support/cost is recorded; baseline remains green; POC is isolated and bounded; replay/failure/security/cost tests run; decision is evidence-based; adopted architecture is documented or rejected experiment is closed cleanly.

HINT 1 — CONCEPT

Choose the smallest limitation with the clearest measurable success criterion.

HINT 2 — PSEUDOCODE

Baseline -> one-source POC -> initial run -> no-new-data rerun -> duplicate/schema/failure tests -> cost/security review -> decision.

HINT 3 — NEAR-COMPLETE PATTERN

For an Auto Loader POC, use one nested JSON feed, separate input/schema/checkpoint/table locations, `availableNow`, and reconcile every run to a controlled file set before considering adoption.

13. Expected files or output

- Completed extension decision record.
- Official-source/access-date notes.
- Green pre-change baseline.

- Bounded POC code and isolated resources.
- Replay/failure/cost/security evidence.
- Adopt/revise/reject conclusion and rollback outcome.

14. How to verify

- The core Track A path still works.
- No optional feature is described as required or complete without evidence.
- Feature name, tier, and status were checked on the start date.
- State/checkpoint/schema/network/secret locations are explicit.
- Duplicate/replay/late/change behavior is tested.
- Costs and cleanup are recorded.
- Documentation/lineage updates match the final decision.

15. Automated tests

- Core regression suite before and after.
- Initial and no-new-data rerun.
- Duplicate/replay behavior.
- Schema/change/order/late-data test appropriate to extension.
- Failure and recovery.
- Security/secret/network review.
- Cost/quota and resource cleanup check.

16. Common errors and exact fixes

Message/symptom	Likely cause	Exact diagnostic	Safe fix	Verify
Feature unavailable in work-space	Tier, cloud, region, preview status, or permissions differ.	Check current official docs and account capability page.	Do not work around with insecure assumptions; choose an available POC or record blocked status.	Decision record states actual support.
Auto Loader reprocesses/ignores unexpected file version	Overwrite policy, checkpoint state, or source path changed.	Inspect checkpoint, file metadata/state, and allow-overwrites policy.	Use immutable landing files by default; explicitly test/document overwrite semantics.	Controlled file-set reconciliation passes.
CDC misses deletes or changes order	Source capture mode/retention/sequence semantics are incomplete.	Inspect source log position, operation type, and ordering key.	Define snapshot plus ordered changes, delete handling, retention, and replay tests.	Target reflects all controlled operations once.
POC creates unexpected cost	Compute/storage/event resources were not bounded or stopped.	Open billing/quota/resource inventory and run history.	Stop/delete resources, lower scale, add auto-stop/budget/exit limit.	Resource cleanup and cost evidence recorded.
Core tests fail after extension	Optional code changed shared contracts without migration.	Compare baseline and diff; run first failing test.	Isolate/revert or create an explicit versioned migration with compatibility tests.	Baseline and adopted extension tests pass.

For deeper tool-specific diagnosis, use [the troubleshooting index near the end of this workbook](#).

17. Explain it in your own words

1. Why should an extension start from a limitation rather than a tool name?
2. What state does Auto Loader need for safe incremental processing?
3. What extra semantics must CDC handle beyond append-only extraction?
4. Why is a rejected POC still useful portfolio evidence?

Write your answers in the learning-journal fields in this phase. Do not copy the wording above.

18. Mini quiz

1. Are optional extensions required for the project definition of done?
2. What current Databricks name replaces older Asset Bundles wording?

3. Name three tests required before adopting an incremental ingestion POC.

Record your answers before opening the answer key.

19. Screenshot checkpoint

Capture only the selected POC: decision record, official feature/tier evidence, isolated resource/path, controlled run history, test results, cost cleanup, and final decision. Do not imply all listed extensions were built.

Save the image under docs/images/ with a descriptive filename. Check that no credential, token, password, or unnecessary personal account detail is visible.

20. Git checkpoint and suggested commit message

Run `git status`, review the Source Control diff in VS Code, stage only the intended files, then commit:

```
experiment: evaluate one optional platform extension
```

Push the feature branch only after tests pass.

21. Completion checklist

Use one status per item: Not started, In progress, Verified by me, or Needs troubleshooting.

☐

Measured limitation selected — [STATUS]

☐

Official support/cost verified — [STATUS]

☐

Baseline green — [STATUS]

☐

Isolated POC built — [STATUS]

☐

Replay/failure/security tests complete — [STATUS]

☐

Cost/resources cleaned — [STATUS]

☐

Adopt/revise/reject documented — [STATUS]

☐

Core Track A remains valid — [STATUS]

Attempt the task and record what failed before reading the optional reference answer in this phase: the optional reference-answer section later in this workbook#phase-22. The quiz answer is in the answer-key section immediately after the quiz in this workbook#phase-22.

Next phase: Return to the master checklist. The required project is ready only when its verification gates—not optional technology count—are marked Verified by me.

Appendices and supporting documents

- [Optional reference answers](the optional reference-answer section later in this workbook)
- [Mini quiz answer key](the answer-key section immediately after the quiz in this workbook)

Definition of done

Files existing is not completion. Open ../the final definition-of-done section in this workbook and mark a gate Verified by me only after its exact command/query/test/evidence succeeds. Required gates cover repository setup, installations, both source databases, deterministic generation, source loading/reconciliation, extraction manifests, Bronze/Silver/Gold, SCD2, duplicate reruns, blocking quality failure, Job order/repair, SQL Server warehouse publication, Power BI relationships/DAX, CI, documentation, screenshots, and interview teach-back.

The required project does not depend on Phase 22. One small well-tested extension is more valuable than many unsupported technology names.

End of the guided build notebook

You now have a complete learning notebook rather than a short showcase notebook. The project is not considered finished merely because these instructions exist. Your own screenshots, local database objects, Databricks run IDs, test results, warehouse reconciliation, Power BI model, and Git history are the proof of completion.

Final honesty check

- Keep [ADD YOUR VERIFIED . . .] placeholders until you have evidence.
- Never publish reference code as though you designed every line without understanding it.
- Be ready to explain the grain, keys, quality rules, idempotency strategy, SCD behavior, reconciliation, orchestration dependencies, and local-first limitations in your own words.

Required action cards

Action 22.2.1 — Choose one measured limitation, not one technology. Example: manual upload misses newly arrived files; report

Application:

Visual Studio Code

Window or panel:

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

Starting condition:

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

Current folder or location:

The repository root C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username.

What you are about to do:

Choose one measured limitation, not one technology. Example: manual upload misses newly arrived files; report . This is one bounded construction or inspection task.

Why this action comes now:

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

Exact physical actions:

1. Bring the application named above to the front and confirm that no unrelated window has focus.
2. Read the starting condition and compare it with what is visible on your screen.
3. Perform only this immediate task: Choose one measured limitation, not one technology. Example: manual upload misses newly arrived files; report latency target is now under 15 minutes; source corrections/deletes are not captured.
4. Pause while the application finishes the operation; do not click the same control twice.
5. Inspect the visible result before changing another file, object, or setting.
6. Record the actual result in the verification field for this action.

Command or code:

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

Where to enter it:

Visual Studio Code. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

What each part means:

Step 1

Action

Choose one measured limitation, not one technology. Example: manual upload misses newly arrived files; report latency target is now under 15 minutes; source corrections/deletes are not captured.

Before continuing

☐

I used the application named in this phase.

☐

I confirmed the current folder/database/catalog/schema.

☐

I can describe what changed on the screen or filesystem.

☐

I know which later verification proves this step worked.

What should happen:

A visible file, folder, branch, connection, table, notebook, task, relationship, measure, visual, or verification result should appear exactly where the action predicts.

Expected example:

Your exact values may differ. The expected result is the same *type* of object and the same required status, not necessarily the same timestamps, row counts, colors, generated IDs, or screen dimensions.

What may look different:

Menu wording can vary by product release or account tier. Use the official-source register and look for the described object rather than guessing from an old screenshot.

How to verify success:

Reopen or refresh the relevant panel, locate the named object, and inspect the property or output that proves it exists and is in the intended location.

Do not continue unless:

You can point to the visible result and explain what it proves. Mark the action VERIFIED BY USER only after that check.

Common mistake:

Combining several clicks or decisions, choosing a similarly named object, or continuing because no error dialog appeared.

Exact recovery:

Stop at the current screen. Save a screenshot of the error if useful, hide sensitive values, and compare the selected location with the starting condition. Use Back or Cancel rather than Delete or Overwrite. Correct one mismatch and repeat only this action.

What you just accomplished:

You completed one observable piece of the Northstar Retail platform and established a checkpoint that can be audited later.

How this connects to the project:

The resulting object, decision, or evidence becomes an input to the next stage in the source-to-consumption chain.

[Back to the Phase 22 lesson index](#)

Action 22.2.2 — Open docs/optional_extensions.md and complete the decision table: problem, requirement, candidate, dependenc

Application:

Visual Studio Code

Window or panel:

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

Starting condition:

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

Current folder or location:

The repository root C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username.

What you are about to do:

Open docs/optional_extensions.md and complete the decision table: problem, requirement, candidate, dependenc. This is one bounded construction or inspection task.

Why this action comes now:

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

Exact physical actions:

1. Bring the application named above to the front and confirm that no unrelated window has focus.
2. Read the starting condition and compare it with what is visible on your screen.
3. Perform only this immediate task: Open docs/optional_extensions.md and complete the decision table: problem, requirement, candidate, dependencies, cost, security, contract changes, test plan, rollback, and exit criteria.
4. Pause while the application finishes the operation; do not click the same control twice.
5. Inspect the visible result before changing another file, object, or setting.
6. Record the actual result in the verification field for this action.

Command or code:

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

Where to enter it:

Visual Studio Code. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

What each part means:**Step 2****Action**

Open docs/optional_extensions.md and complete the decision table: problem, requirement, candidate, dependencies, cost, security, contract changes, test plan, rollback, and exit criteria.

Before continuing☐

I used the application named in this phase.

☐

I confirmed the current folder/database/catalog/schema.

☐

I can describe what changed on the screen or filesystem.

☐

I know which later verification proves this step worked.

What should happen:

A visible file, folder, branch, connection, table, notebook, task, relationship, measure, visual, or verification result should appear exactly where the action predicts.

Expected example:

Your exact values may differ. The expected result is the same *type* of object and the same required status, not necessarily the same timestamps, row counts, colors, generated IDs, or screen dimensions.

What may look different:

Menu wording can vary by product release or account tier. Use the official-source register and look for the described object rather than guessing from an old screenshot.

How to verify success:

Reopen or refresh the relevant panel, locate the named object, and inspect the property or output that proves it exists and is in the intended location.

Do not continue unless:

You can point to the visible result and explain what it proves. Mark the action VERIFIED BY USER only after that check.

Common mistake:

Combining several clicks or decisions, choosing a similarly named object, or continuing because no error dialog appeared.

Exact recovery:

Stop at the current screen. Save a screenshot of the error if useful, hide sensitive values, and compare the selected location with the starting condition. Use Back or Cancel rather than Delete or Overwrite. Correct one mismatch and repeat only this action.

What you just accomplished:

You completed one observable piece of the Northstar Retail platform and established a checkpoint that can be audited later.

How this connects to the project:

The resulting object, decision, or evidence becomes an input to the next stage in the source-to-consumption chain.

[Back to the Phase 22 lesson index](#)

Action 22.2.3 — Read current official documentation on the exact feature and cloud. Confirm availability, account tier, naming

Application:

Visual Studio Code

Window or panel:

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

Starting condition:

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

Current folder or location:

The repository root C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username.

What you are about to do:

Read current official documentation on the exact feature and cloud. Confirm availability, account tier, naming. This is one bounded construction or inspection task.

Why this action comes now:

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

Exact physical actions:

1. Bring the application named above to the front and confirm that no unrelated window has focus.
2. Read the starting condition and compare it with what is visible on your screen.
3. Perform only this immediate task: Read current official documentation on the exact feature and cloud. Confirm availability, account tier, naming, pricing/quota, permissions, network, and preview/GA status on the date you start.
4. Pause while the application finishes the operation; do not click the same control twice.
5. Inspect the visible result before changing another file, object, or setting.
6. Record the actual result in the verification field for this action.

Command or code:

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

Where to enter it:

Visual Studio Code. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

What each part means:

Step 3

Action

Read current official documentation on the exact feature and cloud. Confirm availability, account tier, naming, pricing/quota, permissions, network, and preview/GA status on the date you start.

Before continuing☐

I used the application named in this phase.

☐

I confirmed the current folder/database/catalog/schema.

☐

I can describe what changed on the screen or filesystem.

☐

I know which later verification proves this step worked.

What should happen:

A visible file, folder, branch, connection, table, notebook, task, relationship, measure, visual, or verification result should appear exactly where the action predicts.

Expected example:

Your exact values may differ. The expected result is the same *type* of object and the same required status, not necessarily the same timestamps, row counts, colors, generated IDs, or screen dimensions.

What may look different:

Menu wording can vary by product release or account tier. Use the official-source register and look for the described object rather than guessing from an old screenshot.

How to verify success:

Reopen or refresh the relevant panel, locate the named object, and inspect the property or output that proves it exists and is in the intended location.

Do not continue unless:

You can point to the visible result and explain what it proves. Mark the action VERIFIED BY USER only after that check.

Common mistake:

Combining several clicks or decisions, choosing a similarly named object, or continuing because no error dialog appeared.

Exact recovery:

Stop at the current screen. Save a screenshot of the error if useful, hide sensitive values, and compare the selected location with the starting condition. Use Back or Cancel rather than Delete or Overwrite. Correct one mismatch and repeat only this action.

What you just accomplished:

You completed one observable piece of the Northstar Retail platform and established a checkpoint that can be audited later.

How this connects to the project:

The resulting object, decision, or evidence becomes an input to the next stage in the source-to-consumption chain.

[Back to the Phase 22 lesson index](#)

Action 22.2.4 — Create a dedicated branch such as feature/auto-loader-poc. Run and record the complete baseline suite before

Application:

Visual Studio Code

Window or panel:

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

Starting condition:

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

Current folder or location:

The repository root C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username.

What you are about to do:

Create a dedicated branch such as feature/auto-loader-poc. Run and record the complete baseline suite before. This is one bounded construction or inspection task.

Why this action comes now:

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

Exact physical actions:

1. Bring the application named above to the front and confirm that no unrelated window has focus.
2. Read the starting condition and compare it with what is visible on your screen.
3. Perform only this immediate task: Create a dedicated branch such as feature/auto-loader-poc. Run and record the complete baseline suite before changing architecture.
4. Pause while the application finishes the operation; do not click the same control twice.
5. Inspect the visible result before changing another file, object, or setting.
6. Record the actual result in the verification field for this action.

Command or code:

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

Where to enter it:

Visual Studio Code. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

What each part means:**Step 4****Action**

Create a dedicated branch such as feature/auto-loader-poc. Run and record the complete baseline suite before changing architecture.

Before continuing☐

I used the application named in this phase.

☐

I confirmed the current folder/database/catalog/schema.

☐

I can describe what changed on the screen or filesystem.

☐

I know which later verification proves this step worked.

What should happen:

A visible file, folder, branch, connection, table, notebook, task, relationship, measure, visual, or verification result should appear exactly where the action predicts.

Expected example:

Your exact values may differ. The expected result is the same *type* of object and the same required status, not necessarily the same timestamps, row counts, colors, generated IDs, or screen dimensions.

What may look different:

Menu wording can vary by product release or account tier. Use the official-source register and look for the described object rather than guessing from an old screenshot.

How to verify success:

Reopen or refresh the relevant panel, locate the named object, and inspect the property or output that proves it exists and is in the intended location.

Do not continue unless:

You can point to the visible result and explain what it proves. Mark the action VERIFIED BY USER only after that check.

Common mistake:

Combining several clicks or decisions, choosing a similarly named object, or continuing because no error dialog appeared.

How this connects to the project:

The resulting object, decision, or evidence becomes an input to the next stage in the source-to-consumption chain.

[Back to the Phase 22 lesson index](#)

Action 22.2.5 — Design the smallest proof: one source/table, one controlled input batch/event, one checkpoint/state location,

Application:

Visual Studio Code

Window or panel:

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

Starting condition:

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

Current folder or location:

The repository root C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username.

What you are about to do:

Design the smallest proof: one source/table, one controlled input batch/event, one checkpoint/state location, . This is one bounded construction or inspection task.

Why this action comes now:

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

Exact physical actions:

1. Bring the application named above to the front and confirm that no unrelated window has focus.
2. Read the starting condition and compare it with what is visible on your screen.
3. Perform only this immediate task: Design the smallest proof: one source/table, one controlled input batch/event, one checkpoint/state location, one quality rule, one replay/rerun test, one cost boundary, and one rollback.
4. Pause while the application finishes the operation; do not click the same control twice.
5. Inspect the visible result before changing another file, object, or setting.
6. Record the actual result in the verification field for this action.

Command or code:

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

Where to enter it:

Visual Studio Code. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

What each part means:

Step 5

Action

Design the smallest proof: one source/table, one controlled input batch/event, one checkpoint/state location, one quality rule, one replay/rerun test, one cost boundary, and one rollback.

Before continuing☐

I used the application named in this phase.

☐

I confirmed the current folder/database/catalog/schema.

☐

I can describe what changed on the screen or filesystem.

☐

I know which later verification proves this step worked.

What should happen:

A visible file, folder, branch, connection, table, notebook, task, relationship, measure, visual, or verification result should appear exactly where the action predicts.

Expected example:

Your exact values may differ. The expected result is the same *type* of object and the same required status, not necessarily the same timestamps, row counts, colors, generated IDs, or screen dimensions.

What may look different:

Menu wording can vary by product release or account tier. Use the official-source register and look for the described object rather than guessing from an old screenshot.

Combining several clicks or decisions, choosing a similarly named object, or continuing because no error dialog appeared.

Exact recovery:

Stop at the current screen. Save a screenshot of the error if useful, hide sensitive values, and compare the selected location with the starting condition. Use Back or Cancel rather than Delete or Overwrite. Correct one mismatch and repeat only this action.

What you just accomplished:

You completed one observable piece of the Northstar Retail platform and established a checkpoint that can be audited later.

How this connects to the project:

The resulting object, decision, or evidence becomes an input to the next stage in the source-to-consumption chain.

[Back to the Phase 22 lesson index](#)

Action 22.2.6 — For Auto Loader, preserve source metadata and checkpoint/schema locations; test duplicate/replay/schema evolution

Application:

Visual Studio Code

Window or panel:

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

Starting condition:

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

Current folder or location:

The repository root C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username.

What you are about to do:

For Auto Loader, preserve source metadata and checkpoint/schema locations; test duplicate/replay/schema evolution. This is one bounded construction or inspection task.

Why this action comes now:

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

Exact physical actions:

1. Bring the application named above to the front and confirm that no unrelated window has focus.
2. Read the starting condition and compare it with what is visible on your screen.
3. Perform only this immediate task: For Auto Loader, preserve source metadata and checkpoint/schema locations; test duplicate/replay/schema evolution intentionally. Do not convert every Bronze ingestion before the proof succeeds.
4. Pause while the application finishes the operation; do not click the same control twice.

5. Inspect the visible result before changing another file, object, or setting.
6. Record the actual result in the verification field for this action.

Command or code:

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

Where to enter it:

Visual Studio Code. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

What each part means:**Step 6****Action**

For Auto Loader, preserve source metadata and checkpoint/schema locations; test duplicate/replay/schema evolution intentionally. Do not convert every Bronze ingestion before the proof succeeds.

Before continuing☐

I used the application named in this phase.

☐

I confirmed the current folder/database/catalog/schema.

☐

I can describe what changed on the screen or filesystem.

☐

I know which later verification proves this step worked.

What should happen:

A visible file, folder, branch, connection, table, notebook, task, relationship, measure, visual, or verification result should appear exactly where the action predicts.

Expected example:

Your exact values may differ. The expected result is the same *type* of object and the same required status, not necessarily the same timestamps, row counts, colors, generated IDs, or screen dimensions.

What may look different:

Menu wording can vary by product release or account tier. Use the official-source register and look for the described object rather than guessing from an old screenshot.

How to verify success:

Reopen or refresh the relevant panel, locate the named object, and inspect the property or output that proves it exists and is in the intended location.

Do not continue unless:

You can point to the visible result and explain what it proves. Mark the action VERIFIED BY USER only after that check.

Common mistake:

Combining several clicks or decisions, choosing a similarly named object, or continuing because no error dialog appeared.

Exact recovery:

Stop at the current screen. Save a screenshot of the error if useful, hide sensitive values, and compare the selected location with the starting condition. Use Back or Cancel rather than Delete or Overwrite. Correct one mismatch and repeat only this action.

What you just accomplished:

You completed one observable piece of the Northstar Retail platform and established a checkpoint that can be audited later.

How this connects to the project:

The resulting object, decision, or evidence becomes an input to the next stage in the source-to-consumption chain.

Action 22.2.7 — For CDC, define how inserts, updates, deletes, ordering, source log retention, and initial snapshot map to Sil

Application:

Visual Studio Code

Window or panel:

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

Starting condition:

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

Current folder or location:

The repository root C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username.

What you are about to do:

For CDC, define how inserts, updates, deletes, ordering, source log retention, and initial snapshot map to Sil. This is one bounded construction or inspection task.

Why this action comes now:

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

Exact physical actions:

1. Bring the application named above to the front and confirm that no unrelated window has focus.
2. Read the starting condition and compare it with what is visible on your screen.
3. Perform only this immediate task: For CDC, define how inserts, updates, deletes, ordering, source log retention, and initial snapshot map to Silver/Gold and SCD behavior.
4. Pause while the application finishes the operation; do not click the same control twice.
5. Inspect the visible result before changing another file, object, or setting.
6. Record the actual result in the verification field for this action.

Command or code:

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

Where to enter it:

Visual Studio Code. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

What each part means:

Step 7

Action

For CDC, define how inserts, updates, deletes, ordering, source log retention, and initial snapshot map to Silver/Gold and SCD behavior.

[Back to the Phase 22 lesson index](#)

Action 22.2.C1 — Windows PowerShell

Application:

Windows PowerShell or the VS Code PowerShell terminal

Window or panel:

Windows PowerShell

Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

Current folder or location:

The repository root C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username.

What you are about to do:

Run one explained Powershell instruction and inspect its result before any next command is introduced.

Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

Exact physical actions:

1. CLICK: Bring **Windows PowerShell or the VS Code PowerShell terminal** to the front.
2. LOOK FOR: Confirm the current location matches The repository root C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

Command or code (Powershell):

```
git switch main
```

Where to enter it:

Windows PowerShell. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

What each part means:

- **Line 1:** `git switch main` — `git` calls the Git version-control program; `switch` changes the active branch; `main` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation

Does it change anything?

This is intended to inspect or validate state rather than change it.

Is it safe to rerun?

Normally safe to rerun because it is observational, but still confirm the execution location first.

What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

Do not continue unless:

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

Common mistake:

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

Exact recovery:

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

What you just accomplished:

You executed and checked one controlled operation rather than treating a long script as a black box.

How this connects to the project:

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 22 lesson index](#)

Action 22.2.C2 — Windows PowerShell

Application:

Windows PowerShell or the VS Code PowerShell terminal

Window or panel:

Windows PowerShell

Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

Current folder or location:

The repository root `C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project`. The `User` segment is an example; verify your real Windows username.

What you are about to do:

Run one explained Powershell instruction and inspect its result before any next command is introduced.

Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

Exact physical actions:

1. CLICK: Bring **Windows PowerShell or the VS Code PowerShell terminal** to the front.
2. LOOK FOR: Confirm the current location matches The repository root C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

Command or code (Powershell):

```
git pull
```

Where to enter it:

Windows PowerShell. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

What each part means:

- **Line 1:** `git pull` — `git` calls the Git version-control program; `pull` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation

Does it change anything?

This is intended to inspect or validate state rather than change it.

Is it safe to rerun?

Normally safe to rerun because it is observational, but still confirm the execution location first.

What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use Get-Location or Test-Path; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

Do not continue unless:

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

Common mistake:

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

Exact recovery:

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

What you just accomplished:

You executed and checked one controlled operation rather than treating a long script as a black box.

How this connects to the project:

This verified state becomes a dependable input to the next Northstar Retail construction action.

Action 22.2.C5 — Databricks notebook (PySpark)

Application:

Databricks workspace in a web browser

Window or panel:

Databricks notebook (PySpark)

Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

Current folder or location:

The repository root C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username.

What you are about to do:

Run one explained Python instruction and inspect its result before any next command is introduced.

Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

Exact physical actions:

1. CLICK: Bring **Databricks workspace in a web browser** to the front.
2. LOOK FOR: Confirm the current location matches The repository root C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

Command or code (Python):

```
# OPTIONAL POC – do not replace required Bronze until exit criteria pass.
stream = (spark.readStream
    .format('cloudFiles')
    .option('cloudFiles.format', 'json')
    .option('cloudFiles.schemaLocation', '<POC_SCHEMA_LOCATION>')
    .load('<POC_INPUT_PATH>'))

(stream.writeStream
    .option('checkpointLocation', '<POC_CHECKPOINT_LOCATION>')
    .trigger(availableNow=True)
    .toTable('<POC_CATALOG>.<POC_SCHEMA>.bronze_tracking_events'))
```

Where to enter it:

Databricks notebook (PySpark). Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

What each part means:

- **Line 1:** `# OPTIONAL POC — do not replace required Bronze until exit criteria pass.` is a comment for a human reader; it normally does not change data or execute business logic.
- **Line 2:** `stream = (spark.readStream — stream is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; = is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; (is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; spark.readStream is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation`
- **Line 3:** `.format('cloudFiles')` — `.` is a path, relative location, branch-style name, or file argument; verify every character before running it; `format` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `(` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `'cloudFiles'` is a quoted literal; the quotation marks preserve spaces or mark text; `)` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation
- **Line 4:** `.option('cloudFiles.format', 'json')` — `.` is a path, relative location, branch-style name, or file argument; verify every character before running it; `option` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `(` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `'cloudFiles.format'` is a quoted literal; the quotation marks preserve spaces or mark text; `,` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `'json'` is a quoted literal; the quotation marks preserve spaces or mark text; `)` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation
- **Line 5:** `.option('cloudFiles.schemaLocation', '<POC_SCHEMA_LOCATION>')` — `.` is a path, relative location, branch-style name, or file argument; verify every character before running it; `option` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `(` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `'cloudFiles.schemaLocation'` is a quoted literal; the quotation marks preserve spaces or mark text; `,` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `'<POC_SCHEMA_LOCATION>'` is a quoted literal; the quotation marks preserve spaces or mark text; `)` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation
- **Line 6:** `.load('<POC_INPUT_PATH>')` — `.` is a path, relative location, branch-style name, or file argument; verify every character before running it; `load` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `(` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `'<POC_INPUT_PATH>'` is a quoted literal; the quotation marks preserve spaces or mark text; `)` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation
- **Line 7:** blank line used only to separate logical sections for readability.
- **Line 8:** `(stream.writeStream — ( is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; stream.writeStream is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation`
- **Line 9:** `.option('checkpointLocation', '<POC_CHECKPOINT_LOCATION>')` — `.` is a path, relative location, branch-style name, or file argument; verify every character before running it; `option` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `(` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `'checkpointLocation'` is a quoted literal; the quotation marks preserve spaces or mark text; `,` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `'<POC_CHECKPOINT_LOCATION>'` is a quoted literal; the quotation marks preserve spaces or mark text; `)` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation

Action 22.2.C6 — VS Code Markdown

Application:

Visual Studio Code

Window or panel:

VS Code Markdown

Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

Current folder or location:

The repository root C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username.

What you are about to do:

Run one explained Text instruction and inspect its result before any next command is introduced.

Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

Exact physical actions:

1. CLICK: Bring **Visual Studio Code** to the front.
2. LOOK FOR: Confirm the current location matches The repository root C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

Command or code (Text):

```
EXTENSION: TODO(USER)
MEASURED LIMITATION: TODO(USER)
SUCCESS/EXIT CRITERIA: TODO(USER)
CURRENT OFFICIAL SOURCE + ACCESSED DATE: TODO(USER)
COST/SECURITY/NETWORK DEPENDENCIES: TODO(USER)
BASELINE RESULT: TODO(USER)
POC RESULT: TODO(USER)
DECISION: adopt / revise / reject
ROLLBACK: TODO(USER)
```

Where to enter it:

VS Code Markdown. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

What each part means:

- **Line 1:** EXTENSION: TODO(USER) — EXTENSION is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; : is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; TODO is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; (is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; USER is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation;) is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation
- **Line 2:** MEASURED LIMITATION: TODO(USER) — MEASURED is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; LIMITATION is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; : is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; TODO is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; (is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; USER is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation;) is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation

tion, branch-style name, or file argument; verify every character before running it; reject is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation

- **Line 9:** ROLLBACK: TODO(USER) — ROLLBACK is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; : is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; TODO is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; (is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; USER is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation;) is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation

Does it change anything?

This is intended to inspect or validate state rather than change it.

Is it safe to rerun?

Normally safe to rerun because it is observational, but still confirm the execution location first.

What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use Get-Location or Test-Path; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

Do not continue unless:

The result is visible, understandable, and recorded as RUN BY USER or VERIFIED BY USER. Displaying this workbook does not count as execution.

Common mistake:

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

Exact recovery:

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

What you just accomplished:

You executed and checked one controlled operation rather than treating a long script as a black box.

How this connects to the project:

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 22 lesson index](#)

Action 22.2.C7 — Windows PowerShell

Application:

Windows PowerShell or the VS Code PowerShell terminal

Window or panel:

Windows PowerShell

Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

Current folder or location:

The repository root C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username.

What you are about to do:

Run one explained Powershell instruction and inspect its result before any next command is introduced.

Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

Exact physical actions:

1. CLICK: Bring **Windows PowerShell or the VS Code PowerShell terminal** to the front.
2. LOOK FOR: Confirm the current location matches The repository root C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

Command or code (Powershell):

```
python -m scripts.validation.check_required_files
```

Where to enter it:

Windows PowerShell. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

What each part means:

- **Line 1:** `python -m scripts.validation.check_required_files` — `python` invokes Python when that command name is registered; `-m` asks Python to run an installed module; `scripts.validation.check_required_files` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation

Does it change anything?

This is intended to inspect or validate state rather than change it.

Is it safe to rerun?

Normally safe to rerun because it is observational, but still confirm the execution location first.

What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

Do not continue unless:

The result is visible, understandable, and recorded as RUN BY USER or VERIFIED BY USER. Displaying this workbook does not count as execution.

Common mistake:

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

Exact recovery:

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

What you just accomplished:

You executed and checked one controlled operation rather than treating a long script as a black box.

How this connects to the project:

This verified state becomes a dependable input to the next Northstar Retail construction action.

6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

Command or code (Powershell):

```
git diff --stat
```

Where to enter it:

Windows PowerShell. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

What each part means:

- **Line 1:** `git diff --stat` — `git` calls the Git version-control program; `diff` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `--stat` is a command option or flag; its exact behavior is defined beside the command

Does it change anything?

This is intended to inspect or validate state rather than change it.

Is it safe to rerun?

Normally safe to rerun because it is observational, but still confirm the execution location first.

What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

Do not continue unless:

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

Common mistake:

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

Exact recovery:

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

What you just accomplished:

You executed and checked one controlled operation rather than treating a long script as a black box.

How this connects to the project:

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 22 lesson index](#)

What your screen should look like now

Each action you actually performed has a visible result and a recorded ownership status. You have not marked unrun reference commands as complete. The branch, connection, batch, and application context remain known.

Lesson 22.2 completion checklist

☐

I performed actions in order — [STATUS]

☐

I verified each command location — [STATUS]

I distinguished typed text from observed output — [STATUS]

I recorded differences caused by versions/tier — [STATUS]

I stopped at the first unexplained error — [STATUS]

Safe stopping point

Save open work and record the next action number. Close an application only after its operation is complete. On return, re-open the Phase 22 starting-screen checklist and re-verify the active context.

Lesson 22.3 — Create and understand the phase files

What your screen should look like before starting

VS Code Explorer shows the repository root, the intended feature branch is active, and no Phase 22 file is assumed to exist merely because a reference answer appears below. Create each folder only when its first file is needed.

Folder introduction — docs/

Exact folder name: docs

Exact parent: repository root

Why it is needed now: Phase 22 is about to place its first responsibility-specific file here; creating it earlier would have produced an unexplained empty structure.

What will eventually be inside: Only files whose purpose matches this folder's name.

Why another folder is not appropriate: Separation keeps source SQL, transformations, tests, configuration, documentation, and generated artifacts reviewable.

Naming rules: Preserve lowercase/uppercase exactly as shown. Hyphens, underscores, spaces, and plural forms create different paths. This project avoids spaces in technical folder names.

VS Code method

1. CLICK: Open Explorer in VS Code.
2. LOOK FOR: Confirm the repository root is the top folder.
3. Expand the parent path repository root one level at a time.
4. RIGHT-CLICK: Right-click the immediate parent folder.
5. CLICK: **New Folder**.
6. TYPE THIS: docs.
7. PRESS: Enter.
8. LOOK FOR: The folder appears once, at the correct indentation level.

PowerShell method

Action 22.D1.1 — Create the folder docs

Application:

Windows PowerShell or the VS Code PowerShell terminal

Window or panel:

VS Code integrated PowerShell terminal at the repository root

Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

Current folder or location:

The repository root C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username.

What you are about to do:

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

Exact physical actions:

1. CLICK: Bring **Windows PowerShell or the VS Code PowerShell terminal** to the front.
2. LOOK FOR: Confirm the current location matches The repository root C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

Command or code (PowerShell):

```
New-Item -ItemType Directory -Path ".\docs" -ErrorAction Stop
```

Where to enter it:

VS Code integrated PowerShell terminal at the repository root. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

What each part means:

- **Line 1:** `New-Item -ItemType Directory -Path ".\docs" -ErrorAction Stop` — `New-Item` creates a file or folder; `-ItemType` is a command option or flag; its exact behavior is defined beside the command; `Directory` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `-Path` is a command option or flag; its exact behavior is defined beside the command; `".\docs"` is a path, relative location, branch-style name, or file argument; verify every character before running it; `-ErrorAction` is a command option or flag; its exact behavior is defined beside the command; `Stop` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation

Does it change anything?

This can change files, Git state, packages, database objects, or data.

Is it safe to rerun?

Safe to rerun only after reading the idempotency note and confirming that the same batch, file, or object will not be duplicated.

What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

Do not continue unless:

The result is visible, understandable, and recorded as RUN BY USER or VERIFIED BY USER. Displaying this workbook does not count as execution.

Common mistake:

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

Exact recovery:

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

What you just accomplished:

You executed and checked one controlled operation rather than treating a long script as a black box.

How this connects to the project:

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 22 lesson index](#)

Folder-creation decision branches**If the folder is created**

Run `Test-Path -LiteralPath ".\docs" -PathType Container` and require True.

If PowerShell says the folder already exists

Do not delete or recreate it. Run `Get-ChildItem -LiteralPath ".\docs" -Force`, inspect its existing files, and preserve them. Continue only when the existing folder is the intended path.

If the parent path does not exist

Return to the parent-folder tutorial. Create and verify one parent level at a time; do not create the entire future tree in one command.

Verify the folder

1. Run `Test-Path ".\docs" -PathType Container`.
2. Require the output True before creating a child file.
3. Remember: Git does not track an empty folder by itself; the folder becomes visible in Git history when a tracked file is added.

File introduction — docs/optional_extensions.md

Exact filename: optional_extensions.md

Filename extension: .md. In this project it identifies project documentation and helps the correct application choose syntax highlighting or execution behavior.

Exact parent folder: docs relative to the repository root.

Why this file belongs there: Files with the same responsibility are grouped so a reviewer can find configuration, source SQL, transformations, tests, documentation, and report assets without guessing.

What the file will contain: project documentation for Phase 22.

Later dependencies: Later phase commands, tests, GitHub Actions, Databricks tasks, warehouse loads, Power BI work, or portfolio evidence may depend on its exact path.

Should Git track it? Yes, unless the lesson explicitly identifies it as generated data, a local secret, a log, or a machine-specific artifact.

Could it contain secrets? It should not contain live passwords, tokens, connection strings, or account identifiers.

What happens if it is missing: The corresponding phase cannot be reproduced, validated, or explained from the repository alone.

VS Code click path

1. CLICK: In VS Code, open **Explorer** from the left Activity Bar.
2. LOOK FOR: Confirm the top-level folder name is SQL-Data-Warehouse-Project and the status bar shows the intended Git branch.
3. CLICK: Expand each parent folder in docs one level at a time.
4. If a parent folder does not exist, use the folder tutorial in this phase before creating the file.
5. RIGHT-CLICK: Right-click the immediate parent folder.

6. CLICK: Select **New File**.
7. TYPE THIS: `optional_extensions.md`.
8. PRESS: Enter.
9. LOOK FOR: A new editor tab labeled `optional_extensions.md` and an empty file under the correct parent folder.
10. PRESS: Ctrl+S after adding each explained section.

PowerShell path

Action 22.F1.1 — Create the file `docs/optional_extensions.md` from PowerShell

Application:

Windows PowerShell or the VS Code PowerShell terminal

Window or panel:

VS Code integrated PowerShell terminal opened at the repository root

Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

Current folder or location:

The repository root `C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project`. The User segment is an example; verify your real Windows username.

What you are about to do:

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

Exact physical actions:

1. CLICK: Bring **Windows PowerShell or the VS Code PowerShell terminal** to the front.
2. LOOK FOR: Confirm the current location matches The repository root `C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project`. The User segment is an example; verify your real Windows username. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

Command or code (PowerShell):

```
New-Item -ItemType File -Path ".\docs\optional_extensions.md" -ErrorAction Stop
```

Where to enter it:

VS Code integrated PowerShell terminal opened at the repository root. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

What each part means:

- **Line 1:** `New-Item -ItemType File -Path ".\docs\optional_extensions.md" -ErrorAction Stop` — `New-Item` creates a file or folder; `-ItemType` is a command option or flag; its exact behavior is defined beside the command; `File` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `-Path` is a command option or flag; its exact behavior is defined beside the command; `.\docs\optional_extensions.md` is a path, relative location, branch-style name, or file argument; verify every character before running it; `-ErrorAction` is a command option or flag; its exact behavior is defined beside the command; `Stop` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation

Does it change anything?

This can change files, Git state, packages, database objects, or data.

Is it safe to rerun?

Safe to rerun only after reading the idempotency note and confirming that the same batch, file, or object will not be duplicated.

What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

Do not continue unless:

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

Common mistake:

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

Exact recovery:

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

What you just accomplished:

You executed and checked one controlled operation rather than treating a long script as a black box.

How this connects to the project:

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 22 lesson index](#)

File-creation decision branches**If the command creates the file**

Run `Test-Path -LiteralPath ".\docs\optional_extensions.md" -PathType Leaf`. Continue only when it returns True and the file is empty because you just created it.

If PowerShell says the file already exists

Do not add `-Force`, do not clear the file, and do not overwrite it. Open the existing file in VS Code, run `git status --short -- "docs/optional_extensions.md"`, inspect its contents and Git history, and decide whether this lesson should edit the preserved file rather than create a new one.

If PowerShell says part of the path does not exist

Stop. Create only the missing parent folder through the earlier folder tutorial, verify it with `Test-Path -PathType Container`, and rerun this one file command.

File-content construction

1. Start with the smallest header, comment, or first section shown in the phase lesson.
2. Read the purpose before typing the section.
3. Add one logical section at a time.
4. Save with `Ctrl+S`.

5. Run the syntax or content validation named in the phase.
6. Correct the first error before adding another section.
7. Use TODO(USER) where the workbook requires your own decision or verified value.

File verification

1. In the VS Code Explorer, confirm the file appears under docs.
2. Right-click the editor tab and choose **Copy Path**; compare the ending with docs/optional_extensions.md.
3. In PowerShell at the repository root, run Test-Path ".\docs\optional_extensions.md" and require True.
4. Run git status --short -- "docs/optional_extensions.md" to see only this file's Git state.
5. Run the phase-specific validator before committing.

Optional reference answer for docs/optional_extensions.md

Attempt the file construction first. This reference is learning material, not evidence that you created or ran the file.

Language: Markdown

Exact file: docs/optional_extensions.md

Purpose: project documentation.

Inputs: The requirements, configuration, source data, or upstream objects described in Phase 22.

Expected outputs: The file's declared objects, logs, tables, checks, or documentation when the user later runs or reads it.

```
# Optional Extensions – Not Required for the Beginner Definition of Done

| Extension | New concept | Prerequisite | Main new risk | Evidence before claiming completion |
|---|---|---|---|---|
| Streaming ingestion | Event-time, checkpoints, watermarks | Stable batch model | Duplicates/late data/state cost | Restart and late-event tests |
| Change Data Capture | Operation logs and source positions | Source privileges | Missed deletes/order | Replay and delete reconciliation |
| Auto Loader | Incremental file discovery | Cloud storage/UC setup | Schema drift/quota | Backfill and rescued-data tests |
| Lakeflow Declarative Pipelines/current equivalent | Managed declarative dependencies | Workspace feature | Tier/support changes | Current official docs and run evidence |
| dbt | SQL model DAGs/tests/docs | Reachable target/adaptor | Duplicate orchestration | CI and lineage evidence |
| Data contracts | Producer-consumer schema/quality agreement | Stable domains | Governance overhead | Version/change simulation |
| Great Expectations or similar | External quality framework | Existing test strategy | Tool complexity | Same risk coverage and stored results |
| Infrastructure as Code | Repeatable cloud resources | Cloud account and budget | Accidental spend/destruction | Plan/review/destroy evidence |
| Databricks Declarative Automation Bundles | Versioned workspace deployment | CLI/auth/workspace | Environment mismatch | Dev deployment and rollback |
| Azure Data Factory | Managed movement/orchestration | Azure account/network | Cost/duplicate orchestration | Monitored pipeline and rerun proof |
| Kafka | Distributed event streaming | Streaming design | Operational complexity | Partition/replay/exactness tests |
| Machine learning | Forecast/segmentation use | Trusted features and evaluation | Leakage/unfair interpretation | Baseline, holdout, monitoring |
| Forecasting | Time-series demand prediction | Consistent date/product grain | Leakage/seasonality | Backtest and business baseline |
| Customer segmentation | Feature engineering/clustering | Identity/conformed customer | Unstable/unexplainable groups | Stability and interpretation review |
| Slowly changing facts | Correct fact updates over time | Stable fact grain | Double-count/history confusion | Versioning and as-of queries |
| Role/row-level security | User-specific visibility | Identity/governance | Unauthorized access | Positive and negative access tests |
| Cloud deployment | Managed sources/storage/BI | Budget/network/secrets | Security/cost | Architecture review and teardown plan |

Treat every extension as a new project decision, not a badge to add automatically.
```

Line-by-line explanation

- **Line 1:** # Optional Extensions – Not Required for the Beginner Definition of Done is a comment for a human reader; it normally does not change data or execute business logic.
- **Line 2:** blank line used only to separate logical sections for readability.
- **Line 3:** | Extension | New concept | Prerequisite | Main new risk | Evidence before claiming completion | — Extension is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; New is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; concept is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; Prerequisite is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; Main is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; new is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; risk is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; Evidence is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; before is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; claiming is a name, keyword, argument, identifier, or literal whose project-specific role is

described in the surrounding explanation; completion is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation

- **Line 4:** | --- | --- | --- | --- | --- | — --- is a command option or flag; its exact behavior is defined beside the command; --- is a command option or flag; its exact behavior is defined beside the command; --- is a command option or flag; its exact behavior is defined beside the command; --- is a command option or flag; its exact behavior is defined beside the command
- **Line 5:** | Streaming ingestion | Event-time, checkpoints, watermarks | Stable batch model | Duplicates/late data/state cost | Restart and late-event tests | — Streaming is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; ingestion is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; Event-time is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; , is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; checkpoints is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; , is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; watermarks is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; Stable is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; batch is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; model is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; Duplicates is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; / is a path, relative location, branch-style name, or file argument; verify every character before running it; remaining punctuation and identifiers continue the same statement.
- **Line 6:** | Change Data Capture | Operation logs and source positions | Source privileges | Missed deletes/order | Replay and delete reconciliation | — Change is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; Data is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; Capture is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; Operation is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; logs is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; and is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; source is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; positions is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; Source is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; privileges is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; Missed is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; deletes is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; remaining punctuation and identifiers continue the same statement.
- **Line 7:** | Auto Loader | Incremental file discovery | Cloud storage/UC setup | Schema drift/quota | Backfill and rescued-data tests | — Auto is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; Loader is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; Incremental is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; file is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; discovery is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; Cloud is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; storage is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; / is a path, relative location, branch-style name, or file argument; verify every character before running it; UC is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; setup is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; Schema is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; drift is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; remaining punctuation and identifiers continue the same statement.
- **Line 8:** | Lakeflow Declarative Pipelines/current equivalent | Managed declarative dependencies | Workspace feature | Tier/support changes | Current official docs and run evidence | — Lakeflow is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; Declarative is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; Pipelines is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; / is a path, relative location, branch-style name, or file argument; verify every character

before running it; current is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; equivalent is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; Managed is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; declarative is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; dependencies is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; Workspace is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; feature is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; Tier is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; remaining punctuation and identifiers continue the same statement.

- **Line 9:** | dbt | SQL model DAGs/tests/docs | Reachable target/adapters | Duplicate orchestration | CI and lineage evidence | — dbt is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; SQL is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; model is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; DAGs is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; / is a path, relative location, branch-style name, or file argument; verify every character before running it; tests is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; / is a path, relative location, branch-style name, or file argument; verify every character before running it; docs is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; Reachable is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; target is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; / is a path, relative location, branch-style name, or file argument; verify every character before running it; adapters is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; remaining punctuation and identifiers continue the same statement.
- **Line 10:** | Data contracts | Producer-consumer schema/quality agreement | Stable domains | Governance overhead | Version/change simulation | — Data is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; contracts is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; Producer-consumer is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; schema is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; / is a path, relative location, branch-style name, or file argument; verify every character before running it; quality is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; agreement is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; Stable is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; domains is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; Governance is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; overhead is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; Version is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; remaining punctuation and identifiers continue the same statement.
- **Line 11:** | Great Expectations or similar | External quality framework | Existing test strategy | Tool complexity | Same risk coverage and stored results | — Great is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; Expectations is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; or is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; similar is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; External is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; quality is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; framework is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; Existing is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; test is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; strategy is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; Tool is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; complexity is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; remaining punctuation and identifiers continue the same statement.
- **Line 12:** | Infrastructure as Code | Repeatable cloud resources | Cloud account and budget | Accidental spend/destruction | Plan/review/destroy evidence | — Infrastructure is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; as is a name, keyword, argument,

identifier, or literal whose project-specific role is described in the surrounding explanation; Code is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; Repeatable is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; cloud is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; resources is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; Cloud is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; account is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; and is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; budget is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; Accidental is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; spend is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; remaining punctuation and identifiers continue the same statement.

- **Line 13:** | Databricks Declarative Automation Bundles | Versioned workspace deployment | CLI/auth/workspace | Environment mismatch | Dev deployment and rollback | — Databricks is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; Declarative is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; Automation is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; Bundles is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; Versioned is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; workspace is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; deployment is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; CLI is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; / is a path, relative location, branch-style name, or file argument; verify every character before running it; auth is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; / is a path, relative location, branch-style name, or file argument; verify every character before running it; workspace is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; remaining punctuation and identifiers continue the same statement.

File introduction — docs/runbook.md

Exact filename: runbook.md

Filename extension: .md. In this project it identifies project documentation and helps the correct application choose syntax highlighting or execution behavior.

Exact parent folder: docs relative to the repository root.

Why this file belongs there: Files with the same responsibility are grouped so a reviewer can find configuration, source SQL, transformations, tests, documentation, and report assets without guessing.

What the file will contain: project documentation for Phase 22.

Later dependencies: Later phase commands, tests, GitHub Actions, Databricks tasks, warehouse loads, Power BI work, or portfolio evidence may depend on its exact path.

Should Git track it? Yes, unless the lesson explicitly identifies it as generated data, a local secret, a log, or a machine-specific artifact.

Could it contain secrets? It should not contain live passwords, tokens, connection strings, or account identifiers.

What happens if it is missing: The corresponding phase cannot be reproduced, validated, or explained from the repository alone.

VS Code click path

1. CLICK: In VS Code, open **Explorer** from the left Activity Bar.
2. LOOK FOR: Confirm the top-level folder name is SQL-Data-Warehouse-Project and the status bar shows the intended Git branch.
3. CLICK: Expand each parent folder in docs one level at a time.
4. If a parent folder does not exist, use the folder tutorial in this phase before creating the file.
5. RIGHT-CLICK: Right-click the immediate parent folder.
6. CLICK: Select **New File**.
7. TYPE THIS: `runbook.md`.
8. PRESS: Enter.
9. LOOK FOR: A new editor tab labeled `runbook.md` and an empty file under the correct parent folder.
10. PRESS: Ctrl+S after adding each explained section.

PowerShell path

Action 22.F2.1 — Create the file docs/runbook.md from PowerShell

Application:

Windows PowerShell or the VS Code PowerShell terminal

Window or panel:

VS Code integrated PowerShell terminal opened at the repository root

Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

Current folder or location:

The repository root `C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project`. The User segment is an example; verify your real Windows username.

What you are about to do:

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

Exact physical actions:

1. CLICK: Bring **Windows PowerShell or the VS Code PowerShell terminal** to the front.
2. LOOK FOR: Confirm the current location matches The repository root `C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project`. The User segment is an example; verify your real Windows username. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

Command or code (PowerShell):

```
New-Item -ItemType File -Path ".\docs\runbook.md" -ErrorAction Stop
```

Where to enter it:

VS Code integrated PowerShell terminal opened at the repository root. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

What each part means:

- **Line 1:** `New-Item -ItemType File -Path ".\docs\runbook.md" -ErrorAction Stop` — `New-Item` creates a file or folder; `-ItemType` is a command option or flag; its exact behavior is defined beside the command; `File` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `-Path` is a command option or flag; its exact behavior is defined beside the command; `".\docs\runbook.md"` is a path, relative location, branch-style name, or file argument; verify every character before running it; `-ErrorAction` is a command option or flag; its exact behavior is defined beside the command; `Stop` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation

Does it change anything?

This can change files, Git state, packages, database objects, or data.

Is it safe to rerun?

Safe to rerun only after reading the idempotency note and confirming that the same batch, file, or object will not be duplicated.

What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

Do not continue unless:

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

Common mistake:

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

Exact recovery:

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

What you just accomplished:

You executed and checked one controlled operation rather than treating a long script as a black box.

How this connects to the project:

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 22 lesson index](#)

File-creation decision branches

If the command creates the file

Run `Test-Path -LiteralPath ".\docs\runbook.md" -PathType Leaf`. Continue only when it returns `True` and the file is empty because you just created it.

If PowerShell says the file already exists

Do not add `-Force`, do not clear the file, and do not overwrite it. Open the existing file in VS Code, run `git status --short -- "docs/runbook.md"`, inspect its contents and Git history, and decide whether this lesson should edit the preserved file rather than create a new one.

If PowerShell says part of the path does not exist

Stop. Create only the missing parent folder through the earlier folder tutorial, verify it with `Test-Path -PathType Container`, and rerun this one file command.

File-content construction

1. Start with the smallest header, comment, or first section shown in the phase lesson.
2. Read the purpose before typing the section.
3. Add one logical section at a time.
4. Save with `Ctrl+S`.
5. Run the syntax or content validation named in the phase.
6. Correct the first error before adding another section.
7. Use `TODO(USER)` where the workbook requires your own decision or verified value.

File verification

1. In the VS Code Explorer, confirm the file appears under `docs`.
2. Right-click the editor tab and choose **Copy Path**; compare the ending with `docs/runbook.md`.
3. In PowerShell at the repository root, run `Test-Path ".\docs\runbook.md"` and require `True`.
4. Run `git status --short -- "docs/runbook.md"` to see only this file's Git state.
5. Run the phase-specific validator before committing.

Optional reference answer for docs/runbook.md

Attempt the file construction first. This reference is learning material, not evidence that you created or ran the file.

Language: Markdown

Exact file: `docs/runbook.md`

Purpose: project documentation.

Inputs: The requirements, configuration, source data, or upstream objects described in Phase 22.

Expected outputs: The file's declared objects, logs, tables, checks, or documentation when the user later runs or reads it.

```
# Daily Batch Runbook – Track A

## Before the run

1. **PowerShell, repository root:** activate `.env` and run `git status`. Do not run from an unknown folder.
2. Confirm SQL Server and PostgreSQL services are running.
3. Confirm `.env` exists locally and is not tracked: `git check-ignore .env` should print `.env`.
4. Record the last successful high-water marks and any unresolved quality exceptions.

## Extract

```powershell
python -m scripts.extraction.extract_local_sources --mode incremental --watermark "[LAST_VERIFIED_UTC_TIMESTAMP]"
```

Expected: a new `datasets/raw/EXT-.../batch` folder with `batch_manifest.json`. Do not rename individual files.

## Handoff to Databricks

Upload the entire `EXT-...` folder beneath `/Volumes/<catalog>/landing/track_a_files/`. Verify the remote folder name exactly matches the local batch ID.

## Process

Run the Lakeflow Job with `batch_id=EXT-...`. Monitor tasks in dependency order. A red quality task is a stop condition, not permission to run publication manually.

## Repair

1. Open the failed task output and the relevant quarantine/test table.
2. Decide whether the failure is input quality, code, configuration, permission, or transient infrastructure.
3. Correct the cause in a branch and rerun automated tests.
4. Use **Repair run** from the earliest affected task. Same-batch logic must replace/merge safely.
5. Confirm row counts did not double.

## Publish

After the quality gate passes, download /gold\_exports/<batch\_id>/ and run:

```
python -m scripts.loading.load_gold_to_sqlserver --input-dir "C:\path\to\downloaded\gold_exports\<batch_id>" --mode full-dev
```

Then run sql/sqlserver/validation/02\_validate\_warehouse.sql in SSMS.

## Consume

Refresh Power BI only after SQL Server audit and reconciliation checks pass. Validate the KPI cards against kpi\_validation\_queries.sql, then capture the batch ID and refresh timestamp.

## Incident evidence

Preserve the local manifest, Databricks run URL/ID, failed message, quarantine counts, repair commit, final quality results, SQL audit rows, and Power BI validation. Redact secrets.

#### Line-by-line explanation

#### ## What your screen should look like now

- Every Phase 22 file you actually created appears under the correct parent folder.
- Your open editor tab matches the file you are validating.
- The Git branch has not changed unexpectedly.
- `git status --short` lists only expected work.
- Reference answers remain reference material; your status fields are not automatically completed.

#### ## Lesson 22.3 completion checklist

- [ ] `docs/optional\_extensions.md` was created by me, saved, located correctly, and inspected – [STATUS]
- [ ] `docs/runbook.md` was created by me, saved, located correctly, and inspected – [STATUS]

#### ## Safe stopping point

Save every open file with Ctrl+S. You may close VS Code only after `git status --short` is recorded in your journal. The terminal may be closed when no installer, transaction, Python process, Databricks run, warehouse load, or Power BI refresh is active. Resume at [Lesson 22.4] (#phase-22-lesson-4) and recheck the root and branch.

<a id="phase-22-lesson-4"></a>

#### ## Lesson 22.4 – Build and validate required objects

##### ## What your screen should look like before starting

The phase files are saved, the correct application and connection are visible, and the upstream input has passed its verification gate. Build one object at a time; do not create many objects and inspect them only at the end.

<a id="action-22-4-g1"></a>

##### ## Action 22.4.G1 – Inspect the current state without changing it

**Application:**  
VS Code

**Window or panel:**  
Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

**Starting condition:**  
The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

**Current folder or location:**  
The repository root `C:\Users\User\Desktop\Northstar\_Retail\SQL-Data-Warehouse-Project`. The `User` segment is an example; verify your real Windows username.

**What you are about to do:**  
Inspect the current state without changing it. This is one bounded construction or inspection task.

**Why this action comes now:**  
It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

**Exact physical actions:**

1. Record the exact starting folders, branch, versions, connections, settings, counts, or evidence.
2. Inspect the result.
3. Record the actual value.
4. Continue only after verification.

**\*\*Command or code:\*\***

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

**\*\*Where to enter it:\*\***  
VS Code. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

**\*\*What each part means:\*\***

1. Record the exact starting folders, branch, versions, connections, settings, counts, or evidence.
2. Inspect the result.
3. Record the actual value.
4. Continue only after verification.

**\*\*What should happen:\*\***  
A visible file, folder, branch, connection, table, notebook, task, relationship, measure, visual, or verification result should appear exactly where the action predicts.

**\*\*Expected example:\*\***

> Your exact values may differ. The expected result is the same *\*type\** of object and the same required status, not necessarily the same timestamps, row counts, colors, generated IDs, or screen dimensions.

**\*\*What may look different:\*\***  
Menu wording can vary by product release or account tier. Use the official-source register and look for the described object rather than guessing from an old screenshot.

**\*\*How to verify success:\*\***  
Reopen or refresh the relevant panel, locate the named object, and inspect the property or output that proves it exists and is in the intended location.

**\*\*Do not continue unless:\*\***  
You can point to the visible result and explain what it proves. Mark the action `VERIFIED BY USER` only after that check.

**\*\*Common mistake:\*\***  
Combining several clicks or decisions, choosing a similarly named object, or continuing because no error dialog appeared.

**\*\*Exact recovery:\*\***  
Stop at the current screen. Save a screenshot of the error if useful, hide sensitive values, and compare the selected location with the starting condition. Use Back or Cancel rather than Delete or Overwrite. Correct one mismatch and repeat only this action.

**\*\*What you just accomplished:\*\***  
You completed one observable piece of the Northstar Retail platform and established a checkpoint that can be audited later.

**\*\*How this connects to the project:\*\***  
The resulting object, decision, or evidence becomes an input to the next stage in the source-to-consumption chain.

[Back to the Phase 22 lesson index](#phase-22-lesson-index)

<a id="action-22-4-g2"></a>  
## Action 22.4.G2 – Create the smallest required object or decision

**\*\*Application:\*\***  
Visual Studio Code

**\*\*Window or panel:\*\***  
Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

**\*\*Starting condition:\*\***  
The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

**\*\*Current folder or location:\*\***  
The repository root `C:\Users\User\Desktop\Northstar\_Retail\SQL-Data-Warehouse-Project`. The `User` segment is an example; verify your real Windows username.

**\*\*What you are about to do:\*\***  
Create the smallest required object or decision. This is one bounded construction or inspection task.

**\*\*Why this action comes now:\*\***  
It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

**\*\*Exact physical actions:\*\***

1. Use the phase file tutorial and one bounded action card.
2. Inspect the result.
3. Record the actual value.
4. Continue only after verification.

**\*\*Command or code:\*\***

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

**\*\*Where to enter it:\*\***

Visual Studio Code. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

**\*\*What each part means:\*\***

1. Use the phase file tutorial and one bounded action card.
2. Inspect the result.
3. Record the actual value.
4. Continue only after verification.

**\*\*What should happen:\*\***

A visible file, folder, branch, connection, table, notebook, task, relationship, measure, visual, or verification result should appear exactly where the action predicts.

**\*\*Expected example:\*\***

> Your exact values may differ. The expected result is the same *\*type\** of object and the same required status, not necessarily the same timestamps, row counts, colors, generated IDs, or screen dimensions.

**\*\*What may look different:\*\***

Menu wording can vary by product release or account tier. Use the official-source register and look for the described object rather than guessing from an old screenshot.

**\*\*How to verify success:\*\***

Reopen or refresh the relevant panel, locate the named object, and inspect the property or output that proves it exists and is in the intended location.

**\*\*Do not continue unless:\*\***

You can point to the visible result and explain what it proves. Mark the action ``VERIFIED BY USER`` only after that check.

**\*\*Common mistake:\*\***

Combining several clicks or decisions, choosing a similarly named object, or continuing because no error dialog appeared.

**\*\*Exact recovery:\*\***

Stop at the current screen. Save a screenshot of the error if useful, hide sensitive values, and compare the selected location with the starting condition. Use Back or Cancel rather than Delete or Overwrite. Correct one mismatch and repeat only this action.

**\*\*What you just accomplished:\*\***

You completed one observable piece of the Northstar Retail platform and established a checkpoint that can be audited later.

**\*\*How this connects to the project:\*\***

The resulting object, decision, or evidence becomes an input to the next stage in the source-to-consumption chain.

[Back to the Phase 22 lesson index](#phase-22-lesson-index)

<a id="action-22-4-g3"></a>

## Action 22.4.G3 – Run the phase-specific verification

**\*\*Application:\*\***

VS Code

**\*\*Window or panel:\*\***

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

**\*\*Starting condition:\*\***

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

**\*\*Current folder or location:\*\***

The repository root ``C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project``. The ``User`` segment is an example; verify your real Windows username.

**\*\*What you are about to do:\*\***

Run the phase-specific verification. This is one bounded construction or inspection task.

**\*\*Why this action comes now:\*\***

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

**\*\*Exact physical actions:\*\***

1. Compare actual output with the required condition and record differences.
2. Inspect the result.
3. Record the actual value.
4. Continue only after verification.

**\*\*Command or code:\*\***

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

**\*\*Where to enter it:\*\***

VS Code. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar

field.

**\*\*What each part means:\*\***

1. Compare actual output with the required condition and record differences.
2. Inspect the result.
3. Record the actual value.
4. Continue only after verification.

**\*\*What should happen:\*\***

A visible file, folder, branch, connection, table, notebook, task, relationship, measure, visual, or verification result should appear exactly where the action predicts.

**\*\*Expected example:\*\***

> Your exact values may differ. The expected result is the same *\*type\** of object and the same required status, not necessarily the same timestamps, row counts, colors, generated IDs, or screen dimensions.

**\*\*What may look different:\*\***

Menu wording can vary by product release or account tier. Use the official-source register and look for the described object rather than guessing from an old screenshot.

**\*\*How to verify success:\*\***

Reopen or refresh the relevant panel, locate the named object, and inspect the property or output that proves it exists and is in the intended location.

**\*\*Do not continue unless:\*\***

You can point to the visible result and explain what it proves. Mark the action ``VERIFIED BY USER`` only after that check.

**\*\*Common mistake:\*\***

Combining several clicks or decisions, choosing a similarly named object, or continuing because no error dialog appeared.

**\*\*Exact recovery:\*\***

Stop at the current screen. Save a screenshot of the error if useful, hide sensitive values, and compare the selected location with the starting condition. Use Back or Cancel rather than Delete or Overwrite. Correct one mismatch and repeat only this action.

**\*\*What you just accomplished:\*\***

You completed one observable piece of the Northstar Retail platform and established a checkpoint that can be audited later.

**\*\*How this connects to the project:\*\***

The resulting object, decision, or evidence becomes an input to the next stage in the source-to-consumption chain.

[Back to the Phase 22 lesson index](#phase-22-lesson-index)

<a id="action-22-4-g4"></a>

## Action 22.4.G4 – Demonstrate one safe failure or alternate-result branch

**\*\*Application:\*\***

VS Code

**\*\*Window or panel:\*\***

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

**\*\*Starting condition:\*\***

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

**\*\*Current folder or location:\*\***

The repository root ``C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project``. The ``User`` segment is an example; verify your real Windows username.

**\*\*What you are about to do:\*\***

Demonstrate one safe failure or alternate-result branch. This is one bounded construction or inspection task.

**\*\*Why this action comes now:\*\***

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

**\*\*Exact physical actions:\*\***

1. Use a toy/disposable case and prove recovery without damaging verified work.
2. Inspect the result.
3. Record the actual value.
4. Continue only after verification.

**\*\*Command or code:\*\***

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

**\*\*Where to enter it:\*\***

VS Code. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

**\*\*What each part means:\*\***

1. Use a toy/disposable case and prove recovery without damaging verified work.
2. Inspect the result.
3. Record the actual value.

4. Continue only after verification.

**\*\*What should happen:\*\***

A visible file, folder, branch, connection, table, notebook, task, relationship, measure, visual, or verification result should appear exactly where the action predicts.

**\*\*Expected example:\*\***

> Your exact values may differ. The expected result is the same *\*type\** of object and the same required status, not necessarily the same timestamps, row counts, colors, generated IDs, or screen dimensions.

**\*\*What may look different:\*\***

Menu wording can vary by product release or account tier. Use the official-source register and look for the described object rather than guessing from an old screenshot.

**\*\*How to verify success:\*\***

Reopen or refresh the relevant panel, locate the named object, and inspect the property or output that proves it exists and is in the intended location.

**\*\*Do not continue unless:\*\***

You can point to the visible result and explain what it proves. Mark the action ``VERIFIED BY USER`` only after that check.

**\*\*Common mistake:\*\***

Combining several clicks or decisions, choosing a similarly named object, or continuing because no error dialog appeared.

**\*\*Exact recovery:\*\***

Stop at the current screen. Save a screenshot of the error if useful, hide sensitive values, and compare the selected location with the starting condition. Use Back or Cancel rather than Delete or Overwrite. Correct one mismatch and repeat only this action.

**\*\*What you just accomplished:\*\***

You completed one observable piece of the Northstar Retail platform and established a checkpoint that can be audited later.

**\*\*How this connects to the project:\*\***

The resulting object, decision, or evidence becomes an input to the next stage in the source-to-consumption chain.

[Back to the Phase 22 lesson index](#phase-22-lesson-index)

<a id="action-22-4-g5"></a>

## Action 22.4.G5 – Record evidence and prepare the downstream handoff

**\*\*Application:\*\***

VS Code

**\*\*Window or panel:\*\***

Use the foreground window, sidebar, tab, dialog, query editor, terminal, notebook, or Power BI pane named in the action text. Close no unrelated window merely to make the screen match an example.

**\*\*Starting condition:\*\***

The previous verification gate has passed. Any file you edited is saved. The correct branch, database connection, Databricks workspace, or Power BI file is still active.

**\*\*Current folder or location:\*\***

The repository root ``C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project``. The ``User`` segment is an example; verify your real Windows username.

**\*\*What you are about to do:\*\***

Record evidence and prepare the downstream handoff. This is one bounded construction or inspection task.

**\*\*Why this action comes now:\*\***

It creates or verifies the exact input required by the next action; doing it later would make errors harder to localize.

**\*\*Exact physical actions:\*\***

1. Save the verified input that the next phase consumes.
2. Inspect the result.
3. Record the actual value.
4. Continue only after verification.

**\*\*Command or code:\*\***

No command is required in this action. Use only the clicks, keystrokes, observations, or writing task below.

**\*\*Where to enter it:\*\***

VS Code. When the action is click-only, do not invent a command. When code is shown, use the named editor rather than a visually similar field.

**\*\*What each part means:\*\***

1. Save the verified input that the next phase consumes.
2. Inspect the result.
3. Record the actual value.
4. Continue only after verification.

**\*\*What should happen:\*\***

A visible file, folder, branch, connection, table, notebook, task, relationship, measure, visual, or verification result should appear exactly where the action predicts.

**\*\*Expected example:\*\***

> Your exact values may differ. The expected result is the same *\*type\** of object and the same required status, not necessarily the same timestamps, row counts, colors, generated IDs, or screen dimensions.

**\*\*What may look different:\*\***

Menu wording can vary by product release or account tier. Use the official-source register and look for the described object rather than guessing from an old screenshot.

**\*\*How to verify success:\*\***

Reopen or refresh the relevant panel, locate the named object, and inspect the property or output that proves it exists and is in the intended location.

**\*\*Do not continue unless:\*\***

You can point to the visible result and explain what it proves. Mark the action `VERIFIED BY USER` only after that check.

**\*\*Common mistake:\*\***

Combining several clicks or decisions, choosing a similarly named object, or continuing because no error dialog appeared.

**\*\*Exact recovery:\*\***

Stop at the current screen. Save a screenshot of the error if useful, hide sensitive values, and compare the selected location with the starting condition. Use Back or Cancel rather than Delete or Overwrite. Correct one mismatch and repeat only this action.

**\*\*What you just accomplished:\*\***

You completed one observable piece of the Northstar Retail platform and established a checkpoint that can be audited later.

**\*\*How this connects to the project:\*\***

The resulting object, decision, or evidence becomes an input to the next stage in the source-to-consumption chain.

[Back to the Phase 22 lesson index](#phase-22-lesson-index)

**## What your screen should look like now**

- The new Phase 22 objects are visible in their owning application.
- The current branch remains the intended feature branch.
- The current database, catalog, schema, Power BI model, or GitHub run is still identifiable.
- Verification output is visible or recorded; no object is marked complete solely because creation code was displayed.
- Any failed toy demonstration has been repaired or isolated.

**## Lesson 22.4 completion checklist**

- [ ] Every required object was built separately – [STATUS]
- [ ] Every object has a declared responsibility/grain – [STATUS]
- [ ] Inputs and outputs were inspected – [STATUS]
- [ ] A rerun or alternate-result branch was tested where applicable – [STATUS]
- [ ] Counts, keys, measures, relationships, or settings were independently validated – [STATUS]
- [ ] I can explain one failure and its safest recovery – [STATUS]

**## Safe stopping point**

Stop only after the active command, database transaction, Databricks cell/Job, Python process, warehouse load, or Power BI refresh finishes. Save all files and the Power BI project. Record uncommitted Git changes and exact resume action. Resume at [Lesson 22.5](#phase-22-lesson-5).

<a id="phase-22-lesson-5"></a>

**## Lesson 22.5 – Verify, troubleshoot, commit, teach back, and stop safely**

**## What your screen should look like before starting**

The Phase 22 outputs are visible, all runs are finished, open files are saved, and you can state the active branch and execution context. Any error you encountered has a recorded message and has not been hidden by deleting evidence.

**## Design decision – Batch versus streaming extension**

**\*\*Question:\*\***

Should optional streaming replace the verified batch path?

**\*\*Options considered:\*\***

- Replace batch immediately.
- Add streaming as a separate extension after batch works.
- Never consider streaming.

**\*\*Beginner path selected:\*\***

Keep batch as the baseline and add streaming only with a distinct requirement and cost plan.

**\*\*Why this path was selected:\*\***

The stable batch path remains a rollback and comparison point.

**\*\*Tradeoff:\*\***

Two paths increase maintenance.

**\*\*What a company might do instead:\*\***

Companies select patterns by latency, event semantics, operational maturity, and cost.

**\*\*How to explain this in an interview:\*\***

I treated streaming as an optional architecture decision, not a résumé keyword; I would add it only for a justified latency requirement.

## If you see Result A

Prerequisites, cost, rollback, isolation, and success criteria are written before optional work starts. Record the exact result, perform the named independent verification, and continue only when the gate is satisfied.

## If you see Result B

A prerequisite is missing or the extension would disrupt the verified required path. Treat this as information, not permission to delete or overwrite. Follow the branch-specific diagnostic in the current action, preserve evidence, and continue only after the state is understood.

## If you see an error

Read the first meaningful error line, redact secrets, and verify the application, path, branch, server/database, catalog/schema, batch ID, parameters, version/tier, and object name. Run the smallest observational check first. Do not reset Git history, drop data, disable a rule, force-push, or replace the target merely to make the error disappear.

## Phase-specific verification gate

- [ ] Required files/objects exist in the exact location.
- [ ] I personally created or configured them.
- [ ] I ran the phase commands in the documented context.
- [ ] I inspected the output rather than relying on a green icon alone.
- [ ] Counts, keys, relationships, measures, checksums, statuses, or settings meet the declared contract.
- [ ] Same-batch/rerun behavior is known where applicable.
- [ ] A controlled failure or realistic alternate-result branch was tested safely where applicable.
- [ ] No password, token, or secret appears in tracked files, screenshots, notebook output, terminal history pasted into documentation, or staged changes.
- [ ] Actual verified result: `[ENTER VERIFIED RESULT]`.

## Point-of-failure troubleshooting record

**\*\*Exact or representative error message:\*\***  
`[PASTE THE FIRST MEANINGFUL ERROR, WITH SECRETS REDACTED]`

**\*\*What it means in plain language:\*\***  
`[WRITE YOUR INTERPRETATION]`

**\*\*Most likely cause:\*\***  
`[WRITE ONE TESTABLE HYPOTHESIS]`

**\*\*What not to do:\*\***  
Do not delete data, drop databases, reset Git history, force-push, disable constraints, edit raw evidence, change a quality threshold, or expose credentials merely to make the symptom disappear.

**\*\*First diagnostic action:\*\***  
`[ENTER THE SMALLEST OBSERVATIONAL CHECK]`

**\*\*How to read the diagnostic result:\*\***  
`[RESULT A MEANS... / RESULT B MEANS...]`

**\*\*Safest fix:\*\***  
`[ENTER THE NARROW FIX]`

**\*\*Alternative fix when applicable:\*\***  
`[ENTER OR N/A]`

**\*\*How to verify the fix:\*\***  
`[ENTER THE INDEPENDENT RECHECK]`

**\*\*How to return to the main tutorial:\*\***  
Resume at the exact action number that failed; do not skip its verification gate.

## Screenshot checkpoint

**\*\*Application(s) that should be visible:\*\*** VS Code, architecture notes, cost notes, and whichever optional platform is being evaluated.  
**\*\*Window/panel:\*\*** Show extension decision record showing prerequisites, cost, risks, and rollback path.  
**\*\*Sensitive information to hide:\*\*** Passwords, tokens, connection strings, email addresses, cloud account IDs, unnecessary Windows profile details, and any secret revealed by an error.  
**\*\*Include:\*\*** The object name, batch/run ID when relevant, result/status, and enough surrounding UI to prove which application and layer is shown.  
**\*\*Crop out:\*\*** Unrelated desktop windows, notification previews, bookmarks, chat, and empty background.  
**\*\*Recommended filename:\*\*** `docs/images/phase22\_evaluate-optional-extensions-without-disrupting-the-req\_verified.png`.  
**\*\*Recommended repository folder:\*\*** `docs/images/`.  
**\*\*README placement:\*\*** The section describing Phase 22's verified result; do not use the image before the result is actually verified.  
**\*\*What it proves:\*\*** The visible state existed under the shown context. It does not prove hidden rows, other batches, every filter combination, or a later run.

`[ADD YOUR VERIFIED SCREENSHOT HERE]`

## Git checkpoint after the verified Phase 22 changes

Do not use `git add .` until you understand that it stages every matching change under the current directory, including files you did not intend. Prefer targeted staging after inspecting status and diffs.

### Save open work

1. PRESS: In VS Code, press Ctrl+K, then S if you use **Save All**, or press Ctrl+S in every modified editor.
2. In Power BI, press Ctrl+S and confirm the local file location.
3. Wait for database, Python, Databricks, and refresh operations to finish; Git does not capture uncommitted database/cloud state.

<a id="action-22-5-g1"></a>

## Action 22.5.G1 – Verify the repository root before Git operations

**Application:**

Windows PowerShell or the VS Code PowerShell terminal

**Window or panel:**

VS Code integrated PowerShell terminal

**Starting condition:**

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

**Current folder or location:**

The repository root `C:\Users\User\Desktop\Northstar\_Retail\SQL-Data-Warehouse-Project`. The `User` segment is an example; verify your real Windows username.

**What you are about to do:**

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

**Why this action comes now:**

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

**Exact physical actions:**

1. CLICK: Bring **Windows PowerShell or the VS Code PowerShell terminal** to the front.
2. LOOK FOR: Confirm the current location matches `The repository root `C:\Users\User\Desktop\Northstar\_Retail\SQL-Data-Warehouse-Project`. The `User` segment is an example; verify your real Windows username.` or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

**Command or code (PowerShell):**

```
``powershell
git rev-parse --show-toplevel
```

### Where to enter it:

VS Code integrated PowerShell terminal. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

### Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

### What each part means:

- **Line 1:** `git rev-parse --show-toplevel` — `git` calls the Git version-control program; `rev-parse` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `--show` is a command option or flag; its exact behavior is defined beside the command; `-toplevel` is a command option or flag; its exact behavior is defined beside the command

### Does it change anything?

This is intended to inspect or validate state rather than change it.

### Is it safe to rerun?

Normally safe to rerun because it is observational, but still confirm the execution location first.

### What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

### Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

**What may look different:**

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

**How to verify success:**

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

**Do not continue unless:**

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

**Common mistake:**

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

**Exact recovery:**

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

**What you just accomplished:**

You executed and checked one controlled operation rather than treating a long script as a black box.

**How this connects to the project:**

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 22 lesson index](#)

## Action 22.5.G2 — Verify the active Git branch

**Application:**

Windows PowerShell or the VS Code PowerShell terminal

**Window or panel:**

VS Code integrated PowerShell terminal

**Starting condition:**

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

**Current folder or location:**

The repository root `C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project`. The User segment is an example; verify your real Windows username.

**What you are about to do:**

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

**Why this action comes now:**

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

**Exact physical actions:**

1. CLICK: Bring **Windows PowerShell or the VS Code PowerShell terminal** to the front.
2. LOOK FOR: Confirm the current location matches The repository root `C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project`. The User segment is an example; verify your real Windows username. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.

5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

#### Command or code (PowerShell):

```
git branch --show-current
```

#### Where to enter it:

VS Code integrated PowerShell terminal. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

#### Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

#### What each part means:

- **Line 1:** `git branch --show-current` — `git` calls the Git version-control program; `branch` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `--show` is a command option or flag; its exact behavior is defined beside the command; `-current` is a command option or flag; its exact behavior is defined beside the command

#### Does it change anything?

This is intended to inspect or validate state rather than change it.

#### Is it safe to rerun?

Normally safe to rerun because it is observational, but still confirm the execution location first.

#### What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

#### Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

#### What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

#### How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

#### Do not continue unless:

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

#### Common mistake:

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

#### Exact recovery:

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

#### What you just accomplished:

You executed and checked one controlled operation rather than treating a long script as a black box.

#### How this connects to the project:

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 22 lesson index](#)

## Action 22.5.G3 — Inspect all current Git changes

---

### Application:

Windows PowerShell or the VS Code PowerShell terminal

### Window or panel:

VS Code integrated PowerShell terminal

### Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

### Current folder or location:

The repository root C:\Users\User\Desktop\Northstar\_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username.

### What you are about to do:

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

### Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

### Exact physical actions:

1. CLICK: Bring **Windows PowerShell or the VS Code PowerShell terminal** to the front.
2. LOOK FOR: Confirm the current location matches The repository root C:\Users\User\Desktop\Northstar\_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

### Command or code (PowerShell):

```
git status --short
```

### Where to enter it:

VS Code integrated PowerShell terminal. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

### Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

### What each part means:

- **Line 1:** `git status --short` — `git` calls the Git version-control program; `status` shows tracked, staged, modified, and untracked work; `--short` is a command option or flag; its exact behavior is defined beside the command

### Does it change anything?

This is intended to inspect or validate state rather than change it.

### Is it safe to rerun?

Normally safe to rerun because it is observational, but still confirm the execution location first.

### What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

### Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

**What may look different:**

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

**How to verify success:**

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

**Do not continue unless:**

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

**Common mistake:**

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

**Exact recovery:**

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

**What you just accomplished:**

You executed and checked one controlled operation rather than treating a long script as a black box.

**How this connects to the project:**

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 22 lesson index](#)

**Interpret `git status --short`**

- `??` means untracked: Git sees a new path but it is not staged.
- `M` means modified in the working tree but not staged.
- `M` means the staged version differs from the last commit.
- `MM` means a staged version exists and the file has additional unstaged edits.
- `A` means staged as a new file.
- `D` means deletion; stop and investigate unless deletion is deliberate.
- `R` means rename; inspect both old and new paths.
- A blank result means the working tree is clean. It does not prove database, Databricks, or Power BI work occurred.

## Action 22.5.G4 — Inspect the unstaged diff for `docs/optional_extensions.md`

**Application:**

Windows PowerShell or the VS Code PowerShell terminal

**Window or panel:**

VS Code integrated PowerShell terminal

**Starting condition:**

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

**Current folder or location:**

The repository root `C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project`. The User segment is an example; verify your real Windows username.

**What you are about to do:**

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

### Why this action comes now:

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

### Exact physical actions:

1. CLICK: Bring **Windows PowerShell or the VS Code PowerShell terminal** to the front.
2. LOOK FOR: Confirm the current location matches The repository root C:\Users\User\Desktop\Northstar\_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

### Command or code (PowerShell):

```
git diff -- "docs/optional_extensions.md"
```

### Where to enter it:

VS Code integrated PowerShell terminal. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

### Plain-English translation:

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

### What each part means:

- **Line 1:** `git diff -- "docs/optional_extensions.md"` — `git` calls the Git version-control program; `diff` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `--` is a command option or flag; its exact behavior is defined beside the command; `"docs/optional_extensions.md"` is a path, relative location, branch-style name, or file argument; verify every character before running it

### Does it change anything?

This is intended to inspect or validate state rather than change it.

### Is it safe to rerun?

Normally safe to rerun because it is observational, but still confirm the execution location first.

### What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

### Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

### What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

### How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use Get-Location or Test-Path; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

### Do not continue unless:

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

**Common mistake:**

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

**Exact recovery:**

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

**What you just accomplished:**

You executed and checked one controlled operation rather than treating a long script as a black box.

**How this connects to the project:**

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 22 lesson index](#)

## Action 22.5.G5 — Stage only the reviewed file docs/optional\_extensions.md

---

**Application:**

Windows PowerShell or the VS Code PowerShell terminal

**Window or panel:**

VS Code integrated PowerShell terminal

**Starting condition:**

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

**Current folder or location:**

The repository root C:\Users\User\Desktop\Northstar\_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username.

**What you are about to do:**

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

**Why this action comes now:**

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

**Exact physical actions:**

1. CLICK: Bring **Windows PowerShell or the VS Code PowerShell terminal** to the front.
2. LOOK FOR: Confirm the current location matches The repository root C:\Users\User\Desktop\Northstar\_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

**Command or code (PowerShell):**

```
git add -- "docs/optional_extensions.md"
```

**Where to enter it:**

VS Code integrated PowerShell terminal. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

**Plain-English translation:**

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

### What each part means:

- **Line 1:** `git add -- "docs/optional_extensions.md"` — `git` calls the Git version-control program; `add` moves selected changes into the staging area; `--` is a command option or flag; its exact behavior is defined beside the command; `"docs/optional_extensions.md"` is a path, relative location, branch-style name, or file argument; verify every character before running it

### Does it change anything?

This can change files, Git state, packages, database objects, or data.

### Is it safe to rerun?

Safe to rerun only after reading the idempotency note and confirming that the same batch, file, or object will not be duplicated.

### What should happen:

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

### Expected example:

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

### What may look different:

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

### How to verify success:

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

### Do not continue unless:

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

### Common mistake:

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

### Exact recovery:

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

### What you just accomplished:

You executed and checked one controlled operation rather than treating a long script as a black box.

### How this connects to the project:

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 22 lesson index](#)

For every additional intended path, run a separate targeted `git add -- "path"` after its diff is reviewed. Never stage `.env`, generated raw batches, credentials, tokens, local database files, or an unverified Power BI artifact.

## Action 22.5.G6 — Inspect the staged diff

### Application:

Windows PowerShell or the VS Code PowerShell terminal

### Window or panel:

VS Code integrated PowerShell terminal

### Starting condition:

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

**Current folder or location:**

The repository root C:\Users\User\Desktop\Northstar\_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username.

## Action 22.5.G7 — Create the Phase 22 commit

---

**Application:**

Windows PowerShell or the VS Code PowerShell terminal

**Window or panel:**

VS Code integrated PowerShell terminal

**Starting condition:**

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

**Current folder or location:**

The repository root C:\Users\User\Desktop\Northstar\_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username.

**What you are about to do:**

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

**Why this action comes now:**

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

**Exact physical actions:**

1. CLICK: Bring **Windows PowerShell or the VS Code PowerShell terminal** to the front.
2. LOOK FOR: Confirm the current location matches The repository root C:\Users\User\Desktop\Northstar\_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

**Command or code (PowerShell):**

```
git commit -m "docs: evaluate optional platform extensions"
```

**Where to enter it:**

VS Code integrated PowerShell terminal. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

**Plain-English translation:**

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

**What each part means:**

- **Line 1:** `git commit -m "docs: evaluate optional platform extensions"` — `git` calls the Git version-control program; `commit` records the staged snapshot; `-m` asks Python to run an installed module; `"docs: evaluate optional platform extensions"` is a quoted literal; the quotation marks preserve spaces or mark text

**Does it change anything?**

This can change files, Git state, packages, database objects, or data.

**Is it safe to rerun?**

Safe to rerun only after reading the idempotency note and confirming that the same batch, file, or object will not be duplicated.

**What should happen:**

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

**Expected example:**

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

**What may look different:**

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

**How to verify success:**

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

**Do not continue unless:**

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

**Common mistake:**

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

**Exact recovery:**

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

**What you just accomplished:**

You executed and checked one controlled operation rather than treating a long script as a black box.

**How this connects to the project:**

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 22 lesson index](#)

## Action 22.5.G8 — Verify the new commit

**Application:**

Windows PowerShell or the VS Code PowerShell terminal

**Window or panel:**

VS Code integrated PowerShell terminal

**Starting condition:**

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

**Current folder or location:**

The repository root C:\Users\User\Desktop\Northstar\_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username.

**What you are about to do:**

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

**Why this action comes now:**

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

**Exact physical actions:**

1. CLICK: Bring **Windows PowerShell or the VS Code PowerShell terminal** to the front.
2. LOOK FOR: Confirm the current location matches The repository root C:\Users\User\Desktop\Northstar\_Retail\SQL-Data-Warehouse-Project. The User segment is an example; verify your real Windows username. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

**Command or code (PowerShell):**

```
git log -1 --oneline --decorate
```

**Where to enter it:**

VS Code integrated PowerShell terminal. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

**Plain-English translation:**

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

**What each part means:**

- **Line 1:** `git log -1 --oneline --decorate` — `git` calls the Git version-control program; `log` is a name, keyword, argument, identifier, or literal whose project-specific role is described in the surrounding explanation; `-1` is a command option or flag; its exact behavior is defined beside the command; `--oneline` is a command option or flag; its exact behavior is defined beside the command; `--decorate` is a command option or flag; its exact behavior is defined beside the command

**Does it change anything?**

This is intended to inspect or validate state rather than change it.

**Is it safe to rerun?**

Normally safe to rerun because it is observational, but still confirm the execution location first.

**What should happen:**

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

**Expected example:**

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

**What may look different:**

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

**How to verify success:**

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use

`git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

**Do not continue unless:**

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

**Common mistake:**

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

**Exact recovery:**

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

**What you just accomplished:**

You executed and checked one controlled operation rather than treating a long script as a black box.

**How this connects to the project:**

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 22 lesson index](#)

## Action 22.5.G9 — Push the feature branch and set upstream

---

**Application:**

Windows PowerShell or the VS Code PowerShell terminal

**Window or panel:**

VS Code integrated PowerShell terminal

**Starting condition:**

The preceding action is verified, open work is saved, and you have not assumed that a similarly named folder, branch, server, database, catalog, schema, table, or file is the correct one.

**Current folder or location:**

The repository root `C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project`. The User segment is an example; verify your real Windows username.

**What you are about to do:**

Run one explained PowerShell instruction and inspect its result before any next command is introduced.

**Why this action comes now:**

The next action depends on this command's observed state or created object. Separating commands prevents an early failure from being hidden by later output.

**Exact physical actions:**

1. CLICK: Bring **Windows PowerShell or the VS Code PowerShell terminal** to the front.
2. LOOK FOR: Confirm the current location matches The repository root `C:\Users\User\Desktop\Northstar_Retail\SQL-Data-Warehouse-Project`. The User segment is an example; verify your real Windows username. or the more specific location stated below.
3. CLICK: Place the text cursor in the terminal, query editor, notebook cell, DAX formula bar, or GitHub field named below.
4. TYPE THIS: Enter the command exactly as shown in the code block. Do not type the prompt or expected output.
5. PRESS: Press **Enter** for a one-line terminal command, **F5/Execute** for the named database editor, or the notebook cell Run control as stated.
6. LOOK FOR: Wait until the busy indicator stops and a new prompt, result grid, cell output, or status badge appears.
7. DO NOT CONTINUE UNTIL: Compare the result with the expected shape and complete the verification action.

**Command or code (PowerShell):**

```
git push -u origin "$(git branch --show-current)"
```

**Where to enter it:**

VS Code integrated PowerShell terminal. Do not enter terminal commands into a source-code file and do not paste expected output back into the editor.

**Plain-English translation:**

This instruction asks the selected application to perform exactly the operation named by its leading keyword, using the following names, paths, clauses, flags, and values as inputs.

**What each part means:**

- **Line 1:** `git push -u origin "$(git branch --show-current)"` — `git` calls the Git version-control program; `push` sends local commits to a remote repository; `-u` is a command option or flag; its exact behavior is defined beside the command; `origin` the conventional name of the GitHub remote; `"$(git branch --show-current)"` is a quoted literal; the quotation marks preserve spaces or mark text

**Does it change anything?**

This can change files, Git state, packages, database objects, or data.

**Is it safe to rerun?**

Safe to rerun only after reading the idempotency note and confirming that the same batch, file, or object will not be duplicated.

**What should happen:**

The application should finish without an unhandled error and display a result that corresponds to the command's stated purpose.

**Expected example:**

Your exact values may differ. The exact values may differ. Expect either a version/path/status line, a query result grid, or a clearly labeled completion message that matches the command purpose.

**What may look different:**

Your Windows username, installation version, server instance, database owner, generated identifier, batch timestamp, row count, Databricks interface label, Power BI ribbon position, and terminal theme can differ. A different object name, wrong branch, wrong database, missing target, unexpected duplicate, or failed quality status is not harmless.

**How to verify success:**

Run or perform the smallest independent check named in the lesson. For a path, use `Get-Location` or `Test-Path`; for Git, use `git status` and `git branch --show-current`; for SQL, run a metadata or row-count query; for Databricks, inspect the target object and cell output; for Power BI, compare a filtered DAX result to SQL.

**Do not continue unless:**

The result is visible, understandable, and recorded as `RUN BY USER` or `VERIFIED BY USER`. Displaying this workbook does not count as execution.

**Common mistake:**

The most common mistake is running the right text in the wrong application, folder, database, catalog, schema, branch, or notebook language.

**Exact recovery:**

Do not delete, reset, overwrite, or force-push. Read the first error line. Re-run the location check for this application. Confirm the current folder, branch, server/database, or Databricks catalog. Correct only the mismatched location or spelling, then retry this single command.

**What you just accomplished:**

You executed and checked one controlled operation rather than treating a long script as a black box.

**How this connects to the project:**

This verified state becomes a dependable input to the next Northstar Retail construction action.

[Back to the Phase 22 lesson index](#)

**Verify on GitHub**

1. CLICK: Open the repository page in a browser.
2. CLICK: Open the branch selector above the file list.
3. TYPE THIS: The exact branch name returned locally.
4. CLICK: Select that branch.
5. LOOK FOR: The latest commit message `docs: evaluate optional platform extensions` and the intended changed paths.
6. CLICK: Open each changed file and confirm the GitHub version matches the staged diff.
7. Do not merge solely because the push succeeded; CI and review must pass.

## Push-rejected recovery

If Git says the remote contains work you do not have, do not use `--force`. Run `git fetch origin`, inspect `git log --oneline --graph --decorate --all -20`, then rebase or merge only after understanding the divergence. Resolve conflicts one file at a time, run tests again, and push normally. A rejection protects remote work; it is not permission to overwrite it.

## Explain it in your own words

---

Without copying the model answer, explain:

1. What you created or configured in Phase 22.
2. Why it exists.
3. Where it is located on your computer, in a database, in Databricks, in Power BI, or on GitHub.
4. What information enters it.
5. What information leaves it.
6. How it connects to the next phase.
7. How you verified it.
8. What could cause it to fail.
9. Which decision/tradeoff you could defend in an interview.

## My answer

[WRITE YOUR ANSWER BEFORE READING THE REFERENCE]

## OPTIONAL REFERENCE ANSWER — PHASE 22 TEACH-BACK MODEL

---

Read this only after completing **MY TASK** and using the three hints in order. The model is a learning reference, not evidence of your execution.

“Phase 22 created the verified boundary described by **Evaluate optional extensions without disrupting the required path**. It consumes only the outputs accepted from earlier phases, produces a named and auditable handoff, and records enough metadata and tests to detect wrong context, missing data, duplicates, failed rules, or unsafe reruns. I verified the result in its owning application and connected the evidence to Git without claiming that displayed instructions were executed.”

## Mini quiz

---

1. Multiple choice: Why does Phase 22 occur at this point in the source-to-consumption chain? A) Because menu order is arbitrary. B) Because its verified upstream input now exists. C) Because later phases do not depend on it. D) To create portfolio screenshots before validation.
  2. True or false: A command that displays no error is automatically verified even when it ran in the wrong folder, database, catalog, schema, branch, or filter context.
  3. Fill in the blank: The statement that defines what one row represents is the table or entity \_\_\_\_\_.
  4. What command would you use first to confirm the PowerShell current folder before a repository command?
  5. Troubleshooting: Your output differs from the example. What should you check before deleting, overwriting, resetting, force-pushing, or weakening a test?
  6. Design choice: Explain one tradeoff of Track A and one production alternative.
  7. Code reading: Why are input, accepted, rejected, and deduplicated counts recorded separately?
  8. Ownership: Which status may you select only after personally performing and inspecting the verification?
- 

## Mini quiz answer key and explanations

---

1. **B.** This phase is ordered after its prerequisites so its output has a trustworthy input. A is wrong because order is intentional; C is wrong because later phases depend on the handoff; D is wrong because screenshots follow verification.
2. **False.** Lack of an error proves only that the application accepted something; context and independent verification still matter.
3. **Grain.** Grain is the precise meaning of one row. A key identifies a row, but it does not by itself state the row's business meaning.

- 4. Get-Location.** It shows the shell's current folder. `git rev-parse --show-toplevel` separately verifies the repository root when inside a clone.
- 5.** Check application, folder/path, branch, server/database, catalog/schema, batch ID, parameters, source/target grain, filter context, version/tier differences, and the first meaningful error. Destructive changes are not a diagnostic step.
- 6.** Track A has manual upload/download boundaries and batch latency. A production alternative is routable private connectivity with cloud object storage/managed warehouse, identities, and automated orchestration.
- 7.** Separate counts make every row outcome explainable. A single final count can hide silent drops, duplicates, or records that moved to quarantine.
- 8. Verified by me / VERIFIED BY USER.** `PLANNED`, `CREATED BY USER`, and `RUN BY USER` describe earlier states; only inspected evidence supports verification.

## My Phase 22 Learning Journal

---

**Date completed:**

**What I can now explain without help:**

[WRITE YOUR ANSWER]

**What I still need to practice:**

[WRITE YOUR ANSWER]

## What your screen should look like now

---

- The phase output and final validation are saved or visible.
- The intended feature branch is still active.
- `git status` is either clean after the commit or lists only deliberately deferred work recorded in the journal.
- The branch exists on GitHub after a successful push.
- No database transaction, Databricks run, loader, test process, or Power BI refresh is still active.
- The next phase's required input is identifiable.

## Lesson 22.5 completion checklist

---

☐

I completed the verification gate with my actual results — [STATUS]

☐

I recorded at least one realistic failure, alternate result, or diagnostic path — [STATUS]

☐

I captured and redacted the required screenshot only after verification — [STATUS]

☐

I reviewed, staged, committed, pushed, and verified only the intended Git changes — [STATUS]

☐

I completed the teach-back, quiz, answer review, and learning journal — [STATUS]

☐

I can name the exact verified handoff to the next phase — [STATUS]

## Safe stopping point

---

All files must be saved. The terminal may be closed after the Git result is recorded. SSMS/pgAdmin may be closed after queries finish and transactions are committed/rolled back. Databricks compute may be stopped when no Job or notebook is running. Power BI may be closed after saving. Resume from the next phase's screen-start checklist and re-verify root, branch, connection, and latest accepted batch.

## How this phase connects to the next phase

---

No later required phase. Each extension has its own prerequisite and rollback decision.

## Phase 22 completion checklist

---

☐

Phase goal explained in my own words — [STATUS]

☐

Required files/objects created by me — [STATUS]

☐

Commands run by me — [STATUS]

☐

Output independently inspected — [STATUS]

☐

Failure/alternate branch understood — [STATUS]

☐

Screenshot captured and redacted — [STATUS]

☐

Targeted Git commit exists — [STATUS]

☐

Branch pushed and verified on GitHub — [STATUS]

☐

Quiz completed before answer key — [STATUS]

☐

Journal completed — [STATUS]

☐

Final phase status manually set — [ ] Not started / [-] In progress / [x] Verified by me / [!] Needs troubleshooting

# Complete glossary

[Back to the master table of contents](#)

## Accepted value

---

**Plain-language definition:** A value inside an approved set, such as STORE or ONLINE.

**Everyday analogy:** Like a labeled part of a store or delivery process: the label tells you what belongs there and how it connects to other parts.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 0 to connect source records, batch evidence, lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 0 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 0.

**Interview-ready definition:** A value inside an approved set, such as STORE or ONLINE. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

[Back to the glossary top](#)

## Additive measure

---

**Plain-language definition:** A measure safe to sum across the relevant dimensions, such as sales amount.

**Everyday analogy:** Like a labeled part of a store or delivery process: the label tells you what belongs there and how it connects to other parts.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 0 to connect source records, batch evidence, lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 0 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 0.

**Interview-ready definition:** A measure safe to sum across the relevant dimensions, such as sales amount. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

[Back to the glossary top](#)

## Audit column

---

**Plain-language definition:** Metadata such as batch ID, source system, or load timestamp.

**Everyday analogy:** Like a labeled part of a store or delivery process: the label tells you what belongs there and how it connects to other parts.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 0 to connect source records, batch evidence, lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 0 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 0.

**Interview-ready definition:** Metadata such as batch ID, source system, or load timestamp. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

[Back to the glossary top](#)

## Batch

---

**Plain-language definition:** A named set of records processed together.

**Everyday analogy:** Like a labeled part of a store or delivery process: the label tells you what belongs there and how it connects to other parts.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 0 to connect source records, batch evidence, lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 0 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 0.

**Interview-ready definition:** A named set of records processed together. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

[Back to the glossary top](#)

## Batch ID

---

**Plain-language definition:** A stable identifier connecting one extraction, load, tests, and publication.

**Everyday analogy:** Like a labeled part of a store or delivery process: the label tells you what belongs there and how it connects to other parts.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 0 to connect source records, batch evidence, lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 0 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 0.

**Interview-ready definition:** A stable identifier connecting one extraction, load, tests, and publication. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

[Back to the glossary top](#)

## Branch

---

**Plain-language definition:** A named line of development within a repository.

**Everyday analogy:** Like making changes on a photocopy while the approved original remains untouched.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 1 to connect source records, batch evidence, lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 1 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 1.

**Interview-ready definition:** A named line of development within a repository. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

[Back to the glossary top](#)

## Bronze

---

**Plain-language definition:** Raw, append-oriented lakehouse layer with source evidence.

**Everyday analogy:** Like moving merchandise from receiving, to inspection/cleaning, to labeled shelves ready for shoppers.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 0 to connect source records, batch evidence, lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 0 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 0.

**Interview-ready definition:** Raw, append-oriented lakehouse layer with source evidence. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

[Back to the glossary top](#)

## Business key

---

**Plain-language definition:** A meaningful source identifier such as customer\_number or SKU.

**Everyday analogy:** Like an ID number on a library card: it lets systems point to the intended record without relying on a person's name.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 4 to connect source records, batch evidence, lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 4 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 4.

**Interview-ready definition:** A meaningful source identifier such as customer\_number or SKU. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

[Back to the glossary top](#)

## Cardinality

---

**Plain-language definition:** The relationship pattern between key values, such as one-to-many.

**Everyday analogy:** Like a labeled part of a store or delivery process: the label tells you what belongs there and how it connects to other parts.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 16 to connect source records, batch evidence, lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 16 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 16.

**Interview-ready definition:** The relationship pattern between key values, such as one-to-many. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

[Back to the glossary top](#)

## Catalog

---

**Plain-language definition:** Top-level governed namespace for Databricks data objects.

**Everyday analogy:** Like a labeled part of a store or delivery process: the label tells you what belongs there and how it connects to other parts.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 8 to connect source records, batch evidence, lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 8 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 8.

**Interview-ready definition:** Top-level governed namespace for Databricks data objects. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

[Back to the glossary top](#)

## Change Data Capture

---

**Plain-language definition:** A method of capturing inserts, updates, and deletes from a source.

**Everyday analogy:** Like a labeled part of a store or delivery process: the label tells you what belongs there and how it connects to other parts.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 0 to connect source records, batch evidence, lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 0 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 0.

**Interview-ready definition:** A method of capturing inserts, updates, and deletes from a source. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

[Back to the glossary top](#)

## Checksum

---

**Plain-language definition:** A fingerprint used to detect changed file bytes.

**Everyday analogy:** Like a tamper-evident fingerprint for the exact bytes of a file.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 7 to connect source records, batch evidence, lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 7 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 7.

**Interview-ready definition:** A fingerprint used to detect changed file bytes. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

[Back to the glossary top](#)

## CI/CD

---

**Plain-language definition:** Automated integration checks and, optionally, controlled deployment.

**Everyday analogy:** Like a labeled part of a store or delivery process: the label tells you what belongs there and how it connects to other parts.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 19 to connect source records, batch evidence, lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 19 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 19.

**Interview-ready definition:** Automated integration checks and, optionally, controlled deployment. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

[Back to the glossary top](#)

## Clone

---

**Plain-language definition:** A local repository copied from and connected to a remote repository.

**Everyday analogy:** Like a labeled part of a store or delivery process: the label tells you what belongs there and how it connects to other parts.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 1 to connect source records, batch evidence, lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 1 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 1.

**Interview-ready definition:** A local repository copied from and connected to a remote repository. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

[Back to the glossary top](#)

## Column

---

**Plain-language definition:** One named attribute or measure stored for every row where applicable.

**Everyday analogy:** Like a labeled part of a store or delivery process: the label tells you what belongs there and how it connects to other parts.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 0 to connect source records, batch evidence, lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 0 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 0.

**Interview-ready definition:** One named attribute or measure stored for every row where applicable. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

[Back to the glossary top](#)

## Commit

---

**Plain-language definition:** A recorded snapshot of staged changes with an identifier and message.

**Everyday analogy:** Like sealing and labeling a snapshot of the pages you intentionally selected.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 1 to connect source records, batch evidence, lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 1 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 1.

**Interview-ready definition:** A recorded snapshot of staged changes with an identifier and message. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

[Back to the glossary top](#)

## Constraint

---

**Plain-language definition:** A database rule that rejects data or schema states that violate an invariant.

**Everyday analogy:** Like a labeled part of a store or delivery process: the label tells you what belongs there and how it connects to other parts.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 4 to connect source records, batch evidence, lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 4 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 4.

**Interview-ready definition:** A database rule that rejects data or schema states that violate an invariant. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

[Back to the glossary top](#)

## Consumption layer

---

**Plain-language definition:** Where users query or view data, such as Power BI or SQL.

**Everyday analogy:** Like a labeled part of a store or delivery process: the label tells you what belongs there and how it connects to other parts.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 17 to connect source records, batch evidence,

lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 17 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 17.

**Interview-ready definition:** Where users query or view data, such as Power BI or SQL. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

[Back to the glossary top](#)

## Current row

---

**Plain-language definition:** The active SCD2 version for a business key, usually marked by a flag and open-ended end date.

**Everyday analogy:** Like a labeled part of a store or delivery process: the label tells you what belongs there and how it connects to other parts.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 11 to connect source records, batch evidence, lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 11 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 11.

**Interview-ready definition:** The active SCD2 version for a business key, usually marked by a flag and open-ended end date. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

[Back to the glossary top](#)

## Data contract

---

**Plain-language definition:** Explicit agreement about schema, meaning, quality, and change behavior.

**Everyday analogy:** Like a labeled part of a store or delivery process: the label tells you what belongs there and how it connects to other parts.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 3 to connect source records, batch evidence, lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 3 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 3.

**Interview-ready definition:** Explicit agreement about schema, meaning, quality, and change behavior. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

[Back to the glossary top](#)

## Data lake

---

**Plain-language definition:** Storage for files and varied data, often before relational modeling.

**Everyday analogy:** Like a labeled part of a store or delivery process: the label tells you what belongs there and how it connects to other parts.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 0 to connect source records, batch evidence, lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 0 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 0.

**Interview-ready definition:** Storage for files and varied data, often before relational modeling. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

[Back to the glossary top](#)

## Data lineage

---

**Plain-language definition:** Evidence of how data moves and transforms from source to output.

**Everyday analogy:** Like a labeled part of a store or delivery process: the label tells you what belongs there and how it connects to other parts.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 0 to connect source records, batch evidence, lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 0 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 0.

**Interview-ready definition:** Evidence of how data moves and transforms from source to output. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

## Data quality

---

**Plain-language definition:** Fitness of data for its intended use, measured by rules and evidence.

**Everyday analogy:** Like a labeled part of a store or delivery process: the label tells you what belongs there and how it connects to other parts.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 0 to connect source records, batch evidence, lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 0 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 0.

**Interview-ready definition:** Fitness of data for its intended use, measured by rules and evidence. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

[Back to the glossary top](#)

## Data type

---

**Plain-language definition:** A rule describing how a value is stored and validated, such as integer, date, text, or decimal.

**Everyday analogy:** Like a labeled part of a store or delivery process: the label tells you what belongs there and how it connects to other parts.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 4 to connect source records, batch evidence, lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 4 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 4.

**Interview-ready definition:** A rule describing how a value is stored and validated, such as integer, date, text, or decimal. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

[Back to the glossary top](#)

## Data warehouse

---

**Plain-language definition:** Analytical database organized for stable reporting and history.

**Everyday analogy:** Like a labeled part of a store or delivery process: the label tells you what belongs there and how it connects to other parts.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 0 to connect source records, batch evidence, lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 0 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 0.

**Interview-ready definition:** Analytical database organized for stable reporting and history. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

[Back to the glossary top](#)

## DataFrame

---

**Plain-language definition:** A tabular programming object with named columns and rows used by pandas or Spark.

**Everyday analogy:** Like a labeled part of a store or delivery process: the label tells you what belongs there and how it connects to other parts.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 5 to connect source records, batch evidence, lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 5 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 5.

**Interview-ready definition:** A tabular programming object with named columns and rows used by pandas or Spark. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

[Back to the glossary top](#)

## DDL

---

**Plain-language definition:** Data Definition Language: statements that create or alter database objects.

**Everyday analogy:** Like a labeled part of a store or delivery process: the label tells you what belongs there and how it connects to other parts.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 4 to connect source records, batch evidence, lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 4 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 4.

**Interview-ready definition:** Data Definition Language: statements that create or alter database objects. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

[Back to the glossary top](#)

## Deduplication

---

**Plain-language definition:** Choosing or merging one trusted representation of repeated records.

**Everyday analogy:** Like a labeled part of a store or delivery process: the label tells you what belongs there and how it connects to other parts.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 0 to connect source records, batch evidence, lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 0 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 0.

**Interview-ready definition:** Choosing or merging one trusted representation of repeated records. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

[Back to the glossary top](#)

## Delta Lake

---

**Plain-language definition:** Transactional table layer over lake files used by Databricks.

**Everyday analogy:** Like a labeled part of a store or delivery process: the label tells you what belongs there and how it connects to other parts.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 8 to connect source records, batch evidence, lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 8 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 8.

**Interview-ready definition:** Transactional table layer over lake files used by Databricks. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

[Back to the glossary top](#)

## Delta table

---

**Plain-language definition:** A table backed by Delta Lake transaction metadata and data files.

**Everyday analogy:** Like a labeled part of a store or delivery process: the label tells you what belongs there and how it connects to other parts.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 8 to connect source records, batch evidence, lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 8 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 8.

**Interview-ready definition:** A table backed by Delta Lake transaction metadata and data files. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

[Back to the glossary top](#)

## Dimension

---

**Plain-language definition:** Descriptive context such as customer, product, store, or date.

**Everyday analogy:** Like a catalog card that describes who, what, where, or when.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 0 to connect source records, batch evidence,

lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 0 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 0.

**Interview-ready definition:** Descriptive context such as customer, product, store, or date. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

[Back to the glossary top](#)

## Dimensional model

---

**Plain-language definition:** Analytics model organized around facts and dimensions.

**Everyday analogy:** Like a catalog card that describes who, what, where, or when.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 0 to connect source records, batch evidence, lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 0 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 0.

**Interview-ready definition:** Analytics model organized around facts and dimensions. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

[Back to the glossary top](#)

## DirectQuery

---

**Plain-language definition:** A Power BI storage mode that sends queries to a source instead of importing all model data.

**Everyday analogy:** Like a labeled part of a store or delivery process: the label tells you what belongs there and how it connects to other parts.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 16 to connect source records, batch evidence, lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 16 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 16.

**Interview-ready definition:** A Power BI storage mode that sends queries to a source instead of importing all model data. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

[Back to the glossary top](#)

## DML

---

**Plain-language definition:** Data Manipulation Language: statements that insert, update, delete, or merge rows.

**Everyday analogy:** Like a labeled part of a store or delivery process: the label tells you what belongs there and how it connects to other parts.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 4 to connect source records, batch evidence, lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 4 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 4.

**Interview-ready definition:** Data Manipulation Language: statements that insert, update, delete, or merge rows. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

[Back to the glossary top](#)

## Drill-through

---

**Plain-language definition:** Power BI navigation that opens a detail page filtered to the selected context.

**Everyday analogy:** Like a labeled part of a store or delivery process: the label tells you what belongs there and how it connects to other parts.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 17 to connect source records, batch evidence, lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 17 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 17.

**Interview-ready definition:** Power BI navigation that opens a detail page filtered to the selected context. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

[Back to the glossary top](#)

## Effective date

---

**Plain-language definition:** The date/time from which a dimension version or business rule is valid.

**Everyday analogy:** Like a labeled part of a store or delivery process: the label tells you what belongs there and how it connects to other parts.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 11 to connect source records, batch evidence, lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 11 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 11.

**Interview-ready definition:** The date/time from which a dimension version or business rule is valid. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

[Back to the glossary top](#)

## ELT

---

**Plain-language definition:** Extract and load first, then transform in the target platform.

**Everyday analogy:** Like a labeled part of a store or delivery process: the label tells you what belongs there and how it connects to other parts.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 0 to connect source records, batch evidence, lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 0 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 0.

**Interview-ready definition:** Extract and load first, then transform in the target platform. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

[Back to the glossary top](#)

## Entity relationship diagram

---

**Plain-language definition:** Diagram of tables/entities and their relationships.

**Everyday analogy:** Like a labeled part of a store or delivery process: the label tells you what belongs there and how it connects to other parts.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 0 to connect source records, batch evidence, lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 0 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 0.

**Interview-ready definition:** Diagram of tables/entities and their relationships. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

[Back to the glossary top](#)

## Environment variable

---

**Plain-language definition:** A process-level named value used for configuration without hard-coding it in source code.

**Everyday analogy:** Like a labeled part of a store or delivery process: the label tells you what belongs there and how it connects to other parts.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 6 to connect source records, batch evidence, lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 6 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 6.

**Interview-ready definition:** A process-level named value used for configuration without hard-coding it in source code. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

[Back to the glossary top](#)

## ETL

---

**Plain-language definition:** Extract, transform, and load.

**Everyday analogy:** Like a labeled part of a store or delivery process: the label tells you what belongs there and how it

connects to other parts.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 0 to connect source records, batch evidence, lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 0 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 0.

**Interview-ready definition:** Extract, transform, and load. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

[Back to the glossary top](#)

---

## Fact

**Plain-language definition:** A measurable business event or snapshot at declared grain.

**Everyday analogy:** Like a receipt line or daily stock count that records a measurable event or state.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 0 to connect source records, batch evidence, lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 0 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 0.

**Interview-ready definition:** A measurable business event or snapshot at declared grain. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

[Back to the glossary top](#)

---

## Filter context

**Plain-language definition:** The set of filters under which a DAX measure is evaluated.

**Everyday analogy:** Like a labeled part of a store or delivery process: the label tells you what belongs there and how it connects to other parts.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 16 to connect source records, batch evidence, lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 16 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 16.

**Interview-ready definition:** The set of filters under which a DAX measure is evaluated. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

[Back to the glossary top](#)

---

## Foreign key

**Plain-language definition:** Column that references a key in another table.

**Everyday analogy:** Like an ID number on a library card: it lets systems point to the intended record without relying on a person's name.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 4 to connect source records, batch evidence, lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 4 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 4.

**Interview-ready definition:** Column that references a key in another table. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

[Back to the glossary top](#)

---

## Full refresh

**Plain-language definition:** Replace/rebuild the entire target scope.

**Everyday analogy:** Like a labeled part of a store or delivery process: the label tells you what belongs there and how it connects to other parts.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 0 to connect source records, batch evidence, lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 0 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 0.

**Interview-ready definition:** Replace/rebuild the entire target scope. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

[Back to the glossary top](#)

## GitHub Actions

---

**Plain-language definition:** GitHub's event-driven workflow automation service.

**Everyday analogy:** Like a labeled part of a store or delivery process: the label tells you what belongs there and how it connects to other parts.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 19 to connect source records, batch evidence, lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 19 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 19.

**Interview-ready definition:** GitHub's event-driven workflow automation service. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

[Back to the glossary top](#)

## Gold

---

**Plain-language definition:** Business-ready dimensional and aggregate layer.

**Everyday analogy:** Like moving merchandise from receiving, to inspection/cleaning, to labeled shelves ready for shoppers.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 0 to connect source records, batch evidence, lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 0 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 0.

**Interview-ready definition:** Business-ready dimensional and aggregate layer. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

[Back to the glossary top](#)

## Grain

---

**Plain-language definition:** What exactly one row represents.

**Everyday analogy:** Like deciding whether one receipt line, one whole receipt, or one day is represented by one row before adding numbers.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 0 to connect source records, batch evidence, lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 0 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 0.

**Interview-ready definition:** What exactly one row represents. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

[Back to the glossary top](#)

## High-water mark

---

**Plain-language definition:** Latest source position fully processed by a successful incremental load.

**Everyday analogy:** Like a labeled part of a store or delivery process: the label tells you what belongs there and how it connects to other parts.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 7 to connect source records, batch evidence, lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 7 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 7.

**Interview-ready definition:** Latest source position fully processed by a successful incremental load. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

[Back to the glossary top](#)

## Idempotency key

---

**Plain-language definition:** A stable identifier used to recognize a repeated request, batch, or business event.

**Everyday analogy:** Like an ID number on a library card: it lets systems point to the intended record without relying on a person's name.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 7 to connect source records, batch evidence, lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 7 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 7.

**Interview-ready definition:** A stable identifier used to recognize a repeated request, batch, or business event. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

[Back to the glossary top](#)

## Idempotent

---

**Plain-language definition:** Safe to repeat without changing the trusted result or duplicating data.

**Everyday analogy:** Like a labeled part of a store or delivery process: the label tells you what belongs there and how it connects to other parts.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 7 to connect source records, batch evidence, lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 7 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 7.

**Interview-ready definition:** Safe to repeat without changing the trusted result or duplicating data. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

[Back to the glossary top](#)

## Import mode

---

**Plain-language definition:** A Power BI storage mode that copies source data into the in-memory semantic model during refresh.

**Everyday analogy:** Like a labeled part of a store or delivery process: the label tells you what belongs there and how it connects to other parts.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 16 to connect source records, batch evidence, lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 16 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 16.

**Interview-ready definition:** A Power BI storage mode that copies source data into the in-memory semantic model during refresh. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

[Back to the glossary top](#)

## Incremental load

---

**Plain-language definition:** Process only new or changed data since a known point.

**Everyday analogy:** Like a labeled part of a store or delivery process: the label tells you what belongs there and how it connects to other parts.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 7 to connect source records, batch evidence, lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 7 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 7.

**Interview-ready definition:** Process only new or changed data since a known point. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

[Back to the glossary top](#)

## Index

---

**Plain-language definition:** Database structure that can speed selected access patterns at write/storage cost.

**Everyday analogy:** Like a labeled part of a store or delivery process: the label tells you what belongs there and how it

connects to other parts.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 4 to connect source records, batch evidence, lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 4 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 4.

**Interview-ready definition:** Database structure that can speed selected access patterns at write/storage cost. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

[Back to the glossary top](#)

## Ingestion

---

**Plain-language definition:** Bringing data from a source into the platform.

**Everyday analogy:** Like a labeled part of a store or delivery process: the label tells you what belongs there and how it connects to other parts.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 0 to connect source records, batch evidence, lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 0 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 0.

**Interview-ready definition:** Bringing data from a source into the platform. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

[Back to the glossary top](#)

## JDBC

---

**Plain-language definition:** Java-based database connectivity commonly used by Spark.

**Everyday analogy:** Like a labeled part of a store or delivery process: the label tells you what belongs there and how it connects to other parts.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 8 to connect source records, batch evidence, lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 8 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 8.

**Interview-ready definition:** Java-based database connectivity commonly used by Spark. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

[Back to the glossary top](#)

## Lakeflow Jobs

---

**Plain-language definition:** Databricks orchestration for tasks, dependencies, schedules, and runs.

**Everyday analogy:** Like a labeled part of a store or delivery process: the label tells you what belongs there and how it connects to other parts.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 14 to connect source records, batch evidence, lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 14 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 14.

**Interview-ready definition:** Databricks orchestration for tasks, dependencies, schedules, and runs. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

[Back to the glossary top](#)

## Lakehouse

---

**Plain-language definition:** Platform combining lake flexibility with warehouse-style table reliability.

**Everyday analogy:** Like a labeled part of a store or delivery process: the label tells you what belongs there and how it connects to other parts.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 0 to connect source records, batch evidence, lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 0 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 0.

**Interview-ready definition:** Platform combining lake flexibility with warehouse-style table reliability. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

[Back to the glossary top](#)

## Late-arriving data

---

**Plain-language definition:** A record that reaches the platform after related data or expected time.

**Everyday analogy:** Like a labeled part of a store or delivery process: the label tells you what belongs there and how it connects to other parts.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 0 to connect source records, batch evidence, lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 0 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 0.

**Interview-ready definition:** A record that reaches the platform after related data or expected time. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

[Back to the glossary top](#)

## Late-arriving dimension

---

**Plain-language definition:** A dimension business key that is unavailable when a related fact first arrives.

**Everyday analogy:** Like a catalog card that describes who, what, where, or when.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 11 to connect source records, batch evidence, lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 11 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 11.

**Interview-ready definition:** A dimension business key that is unavailable when a related fact first arrives. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

[Back to the glossary top](#)

## Late-arriving fact

---

**Plain-language definition:** A fact/event that arrives after the period or related records normally expected for it.

**Everyday analogy:** Like a receipt line or daily stock count that records a measurable event or state.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 12 to connect source records, batch evidence, lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 12 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 12.

**Interview-ready definition:** A fact/event that arrives after the period or related records normally expected for it. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

[Back to the glossary top](#)

## Local repository

---

**Plain-language definition:** The Git-tracked project copy on your computer.

**Everyday analogy:** Like a labeled part of a store or delivery process: the label tells you what belongs there and how it connects to other parts.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 0 to connect source records, batch evidence, lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 0 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 0.

**Interview-ready definition:** The Git-tracked project copy on your computer. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

[Back to the glossary top](#)

## Low-water mark

---

**Plain-language definition:** The starting boundary for an incremental range, often the prior successful high-water mark.

**Everyday analogy:** Like a labeled part of a store or delivery process: the label tells you what belongs there and how it connects to other parts.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 7 to connect source records, batch evidence, lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 7 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 7.

**Interview-ready definition:** The starting boundary for an incremental range, often the prior successful high-water mark. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

[Back to the glossary top](#)

## Manifest

---

**Plain-language definition:** File describing batch contents, row counts, checksums, and metadata.

**Everyday analogy:** Like a packing slip listing every box, quantity, and seal number in one shipment.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 7 to connect source records, batch evidence, lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 7 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 7.

**Interview-ready definition:** File describing batch contents, row counts, checksums, and metadata. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

[Back to the glossary top](#)

## Measure

---

**Plain-language definition:** Reusable calculation evaluated under a filter context.

**Everyday analogy:** Like a labeled part of a store or delivery process: the label tells you what belongs there and how it connects to other parts.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 16 to connect source records, batch evidence, lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 16 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 16.

**Interview-ready definition:** Reusable calculation evaluated under a filter context. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

[Back to the glossary top](#)

## Medallion architecture

---

**Plain-language definition:** Bronze/Silver/Gold layering pattern.

**Everyday analogy:** Like a labeled part of a store or delivery process: the label tells you what belongs there and how it connects to other parts.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 0 to connect source records, batch evidence, lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 0 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 0.

**Interview-ready definition:** Bronze/Silver/Gold layering pattern. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

[Back to the glossary top](#)

## Merge conflict

---

**Plain-language definition:** A situation where Git cannot automatically combine competing changes to the same content.

**Everyday analogy:** Like a labeled part of a store or delivery process: the label tells you what belongs there and how it connects to other parts.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 1 to connect source records, batch evidence,

lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 1 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 1.

**Interview-ready definition:** A situation where Git cannot automatically combine competing changes to the same content. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

[Back to the glossary top](#)

## Natural key

---

**Plain-language definition:** Source/business identifier; often the same as business key.

**Everyday analogy:** Like an ID number on a library card: it lets systems point to the intended record without relying on a person's name.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 4 to connect source records, batch evidence, lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 4 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 4.

**Interview-ready definition:** Source/business identifier; often the same as business key. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

[Back to the glossary top](#)

## Non-additive measure

---

**Plain-language definition:** A ratio, percentage, or other measure that should not be summed across rows or groups.

**Everyday analogy:** Like a labeled part of a store or delivery process: the label tells you what belongs there and how it connects to other parts.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 0 to connect source records, batch evidence, lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 0 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 0.

**Interview-ready definition:** A ratio, percentage, or other measure that should not be summed across rows or groups. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

[Back to the glossary top](#)

## Normalized model

---

**Plain-language definition:** Operational design that separates entities to control update consistency.

**Everyday analogy:** Like a labeled part of a store or delivery process: the label tells you what belongs there and how it connects to other parts.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 0 to connect source records, batch evidence, lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 0 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 0.

**Interview-ready definition:** Operational design that separates entities to control update consistency. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

[Back to the glossary top](#)

## ODBC

---

**Plain-language definition:** A standard database-connectivity interface used by drivers and applications.

**Everyday analogy:** Like a labeled part of a store or delivery process: the label tells you what belongs there and how it connects to other parts.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 2 to connect source records, batch evidence, lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 2 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 2.

**Interview-ready definition:** A standard database-connectivity interface used by drivers and applications. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

## Orchestration

---

**Plain-language definition:** Coordinating tasks, order, parameters, retries, schedules, and failure handling.

**Everyday analogy:** Like a stage manager deciding which actor enters, what must finish first, and what happens after a mis-take.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 0 to connect source records, batch evidence, lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 0 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 0.

**Interview-ready definition:** Coordinating tasks, order, parameters, retries, schedules, and failure handling. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

[Back to the glossary top](#)

## Pipeline

---

**Plain-language definition:** A connected sequence that moves and transforms data from source to consumption.

**Everyday analogy:** Like a labeled part of a store or delivery process: the label tells you what belongs there and how it connects to other parts.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 0 to connect source records, batch evidence, lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 0 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 0.

**Interview-ready definition:** A connected sequence that moves and transforms data from source to consumption. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

[Back to the glossary top](#)

## Primary key

---

**Plain-language definition:** Column or set of columns uniquely identifying a table row.

**Everyday analogy:** Like an ID number on a library card: it lets systems point to the intended record without relying on a person's name.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 4 to connect source records, batch evidence, lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 4 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 4.

**Interview-ready definition:** Column or set of columns uniquely identifying a table row. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

[Back to the glossary top](#)

## Pull

---

**Plain-language definition:** Fetch remote changes and integrate them into the current branch.

**Everyday analogy:** Like a labeled part of a store or delivery process: the label tells you what belongs there and how it connects to other parts.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 1 to connect source records, batch evidence, lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 1 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 1.

**Interview-ready definition:** Fetch remote changes and integrate them into the current branch. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

[Back to the glossary top](#)

## Pull request

---

**Plain-language definition:** A proposed set of branch changes submitted for review before merge.

**Everyday analogy:** Like a labeled part of a store or delivery process: the label tells you what belongs there and how it connects to other parts.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 1 to connect source records, batch evidence, lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 1 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 1.

**Interview-ready definition:** A proposed set of branch changes submitted for review before merge. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

[Back to the glossary top](#)

## Push

---

**Plain-language definition:** Send local commits and branch references to a remote repository.

**Everyday analogy:** Like a labeled part of a store or delivery process: the label tells you what belongs there and how it connects to other parts.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 1 to connect source records, batch evidence, lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 1 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 1.

**Interview-ready definition:** Send local commits and branch references to a remote repository. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

[Back to the glossary top](#)

## PySpark

---

**Plain-language definition:** Python interfaces for Apache Spark distributed data processing.

**Everyday analogy:** Like a labeled part of a store or delivery process: the label tells you what belongs there and how it connects to other parts.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 9 to connect source records, batch evidence, lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 9 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 9.

**Interview-ready definition:** Python interfaces for Apache Spark distributed data processing. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

[Back to the glossary top](#)

## Quarantine

---

**Plain-language definition:** Retained records excluded from trusted output with a documented rule.

**Everyday analogy:** Like a clearly labeled inspection area that keeps questionable goods without pretending they disappeared.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 10 to connect source records, batch evidence, lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 10 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 10.

**Interview-ready definition:** Retained records excluded from trusted output with a documented rule. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

[Back to the glossary top](#)

## Query

---

**Plain-language definition:** A statement that asks a database/lakehouse to return or change data.

**Everyday analogy:** Like a labeled part of a store or delivery process: the label tells you what belongs there and how it connects to other parts.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 4 to connect source records, batch evidence, lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 4 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 4.

**Interview-ready definition:** A statement that asks a database/lakehouse to return or change data. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

[Back to the glossary top](#)

## Reconciliation

---

**Plain-language definition:** Comparing independently derived counts/amounts across boundaries.

**Everyday analogy:** Like counting packages at shipping and receiving and investigating every difference.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 7 to connect source records, batch evidence, lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 7 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 7.

**Interview-ready definition:** Comparing independently derived counts/amounts across boundaries. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

[Back to the glossary top](#)

## Record hash

---

**Plain-language definition:** Hash of selected attributes used for change detection or duplicate evidence.

**Everyday analogy:** Like a labeled part of a store or delivery process: the label tells you what belongs there and how it connects to other parts.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 0 to connect source records, batch evidence, lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 0 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 0.

**Interview-ready definition:** Hash of selected attributes used for change detection or duplicate evidence. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

[Back to the glossary top](#)

## Remote repository

---

**Plain-language definition:** The network-hosted project copy, such as the GitHub repository named origin.

**Everyday analogy:** Like a labeled part of a store or delivery process: the label tells you what belongs there and how it connects to other parts.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 0 to connect source records, batch evidence, lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 0 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 0.

**Interview-ready definition:** The network-hosted project copy, such as the GitHub repository named origin. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

[Back to the glossary top](#)

## Repository

---

**Plain-language definition:** A project folder whose files and history are tracked by Git.

**Everyday analogy:** Like a labeled part of a store or delivery process: the label tells you what belongs there and how it connects to other parts.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 1 to connect source records, batch evidence, lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 1 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 1.

**Interview-ready definition:** A project folder whose files and history are tracked by Git. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

## Row

---

**Plain-language definition:** One record in a table at the table's declared grain.

**Everyday analogy:** Like a labeled part of a store or delivery process: the label tells you what belongs there and how it connects to other parts.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 0 to connect source records, batch evidence, lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 0 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 0.

**Interview-ready definition:** One record in a table at the table's declared grain. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

[Back to the glossary top](#)

## Runner

---

**Plain-language definition:** The machine or environment that executes a GitHub Actions job.

**Everyday analogy:** Like a labeled part of a store or delivery process: the label tells you what belongs there and how it connects to other parts.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 19 to connect source records, batch evidence, lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 19 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 19.

**Interview-ready definition:** The machine or environment that executes a GitHub Actions job. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

[Back to the glossary top](#)

## Schema

---

**Plain-language definition:** Namespace and structural definition of database objects.

**Everyday analogy:** Like a labeled part of a store or delivery process: the label tells you what belongs there and how it connects to other parts.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 0 to connect source records, batch evidence, lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 0 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 0.

**Interview-ready definition:** Namespace and structural definition of database objects. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

[Back to the glossary top](#)

## Schema drift

---

**Plain-language definition:** Unexpected or evolving source columns/types.

**Everyday analogy:** Like a labeled part of a store or delivery process: the label tells you what belongs there and how it connects to other parts.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 0 to connect source records, batch evidence, lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 0 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 0.

**Interview-ready definition:** Unexpected or evolving source columns/types. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

[Back to the glossary top](#)

## Secret

---

**Plain-language definition:** A credential or sensitive value that must not be printed or committed.

**Everyday analogy:** Like a labeled part of a store or delivery process: the label tells you what belongs there and how it connects to other parts.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 18 to connect source records, batch evidence, lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 18 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 18.

**Interview-ready definition:** A credential or sensitive value that must not be printed or committed. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

[Back to the glossary top](#)

## Semantic layer

---

**Plain-language definition:** Relationships, measures, formatting, descriptions, and business definitions shared by reports.

**Everyday analogy:** Like a labeled part of a store or delivery process: the label tells you what belongs there and how it connects to other parts.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 16 to connect source records, batch evidence, lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 16 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 16.

**Interview-ready definition:** Relationships, measures, formatting, descriptions, and business definitions shared by reports. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

[Back to the glossary top](#)

## Semantic model

---

**Plain-language definition:** The Power BI layer of tables, relationships, measures, formatting, descriptions, and security used by reports.

**Everyday analogy:** Like a labeled part of a store or delivery process: the label tells you what belongs there and how it connects to other parts.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 16 to connect source records, batch evidence, lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 16 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 16.

**Interview-ready definition:** The Power BI layer of tables, relationships, measures, formatting, descriptions, and security used by reports. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

[Back to the glossary top](#)

## Semi-additive measure

---

**Plain-language definition:** A measure that can be summed across some dimensions but not all, such as inventory balance across products but not across snapshot dates.

**Everyday analogy:** Like a labeled part of a store or delivery process: the label tells you what belongs there and how it connects to other parts.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 0 to connect source records, batch evidence, lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 0 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 0.

**Interview-ready definition:** A measure that can be summed across some dimensions but not all, such as inventory balance across products but not across snapshot dates. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

[Back to the glossary top](#)

## Serverless compute

---

**Plain-language definition:** Provider-managed compute that starts and scales without a user-managed cluster, subject to account features and quotas.

**Everyday analogy:** Like a labeled part of a store or delivery process: the label tells you what belongs there and how it connects to other parts.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 8 to connect source records, batch evidence, lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 8 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 8.

**Interview-ready definition:** Provider-managed compute that starts and scales without a user-managed cluster, subject to account features and quotas. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

[Back to the glossary top](#)

## Silver

---

**Plain-language definition:** Cleaned, typed, conformed, deduplicated trusted-detail layer.

**Everyday analogy:** Like moving merchandise from receiving, to inspection/cleaning, to labeled shelves ready for shoppers.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 0 to connect source records, batch evidence, lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 0 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 0.

**Interview-ready definition:** Cleaned, typed, conformed, deduplicated trusted-detail layer. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

[Back to the glossary top](#)

## Slicer

---

**Plain-language definition:** A Power BI visual control that applies a selected filter to other visuals according to interactions and relationships.

**Everyday analogy:** Like a labeled part of a store or delivery process: the label tells you what belongs there and how it connects to other parts.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 17 to connect source records, batch evidence, lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 17 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 17.

**Interview-ready definition:** A Power BI visual control that applies a selected filter to other visuals according to interactions and relationships. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

[Back to the glossary top](#)

## Slowly Changing Dimension Type 1

---

**Plain-language definition:** Overwrite a dimension attribute without preserving the old value.

**Everyday analogy:** Like a catalog card that describes who, what, where, or when.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 11 to connect source records, batch evidence, lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 11 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 11.

**Interview-ready definition:** Overwrite a dimension attribute without preserving the old value. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

[Back to the glossary top](#)

## Slowly Changing Dimension Type 2

---

**Plain-language definition:** Insert dated versions to preserve attribute history.

**Everyday analogy:** Like a catalog card that describes who, what, where, or when.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 11 to connect source records, batch evidence, lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 11 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 11.

**Interview-ready definition:** Insert dated versions to preserve attribute history. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

[Back to the glossary top](#)

## Snapshot fact

---

**Plain-language definition:** Fact capturing state at a point in time, such as daily inventory.

**Everyday analogy:** Like a receipt line or daily stock count that records a measurable event or state.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 0 to connect source records, batch evidence, lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 0 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 0.

**Interview-ready definition:** Fact capturing state at a point in time, such as daily inventory. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

[Back to the glossary top](#)

## Staging area

---

**Plain-language definition:** The selected file versions that will enter the next Git commit.

**Everyday analogy:** Like a labeled part of a store or delivery process: the label tells you what belongs there and how it connects to other parts.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 1 to connect source records, batch evidence, lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 1 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 1.

**Interview-ready definition:** The selected file versions that will enter the next Git commit. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

[Back to the glossary top](#)

## Star schema

---

**Plain-language definition:** Fact table connected to descriptive dimensions.

**Everyday analogy:** Like a labeled part of a store or delivery process: the label tells you what belongs there and how it connects to other parts.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 0 to connect source records, batch evidence, lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 0 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 0.

**Interview-ready definition:** Fact table connected to descriptive dimensions. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

[Back to the glossary top](#)

## Surrogate key

---

**Plain-language definition:** Warehouse-controlled key independent of source business identifier.

**Everyday analogy:** Like an ID number on a library card: it lets systems point to the intended record without relying on a person's name.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 11 to connect source records, batch evidence, lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 11 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 11.

**Interview-ready definition:** Warehouse-controlled key independent of source business identifier. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

## Tooltip page

---

**Plain-language definition:** A Power BI report page designed to appear as rich hover detail for another visual.

**Everyday analogy:** Like a labeled part of a store or delivery process: the label tells you what belongs there and how it connects to other parts.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 17 to connect source records, batch evidence, lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 17 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 17.

**Interview-ready definition:** A Power BI report page designed to appear as rich hover detail for another visual. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

[Back to the glossary top](#)

## Transaction

---

**Plain-language definition:** All-or-nothing database unit that commits or rolls back.

**Everyday analogy:** Like a checkout that either completes every charge/receipt step or cancels the whole attempt.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 4 to connect source records, batch evidence, lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 4 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 4.

**Interview-ready definition:** All-or-nothing database unit that commits or rolls back. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

[Back to the glossary top](#)

## Transformation

---

**Plain-language definition:** Changing structure, type, quality, or meaning under explicit rules.

**Everyday analogy:** Like a labeled part of a store or delivery process: the label tells you what belongs there and how it connects to other parts.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 0 to connect source records, batch evidence, lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 0 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 0.

**Interview-ready definition:** Changing structure, type, quality, or meaning under explicit rules. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

[Back to the glossary top](#)

## Unity Catalog volume

---

**Plain-language definition:** Governed file storage namespace accessible through Databricks.

**Everyday analogy:** Like a labeled part of a store or delivery process: the label tells you what belongs there and how it connects to other parts.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 8 to connect source records, batch evidence, lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 8 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 8.

**Interview-ready definition:** Governed file storage namespace accessible through Databricks. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

[Back to the glossary top](#)

## Unknown member

---

**Plain-language definition:** Dimension row, usually key 0, for unresolved context.

**Everyday analogy:** Like a labeled part of a store or delivery process: the label tells you what belongs there and how it

connects to other parts.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 11 to connect source records, batch evidence, lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 11 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 11.

**Interview-ready definition:** Dimension row, usually key 0, for unresolved context. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

[Back to the glossary top](#)

## Watermark

---

**Plain-language definition:** See high-water mark.

**Everyday analogy:** Like a labeled part of a store or delivery process: the label tells you what belongs there and how it connects to other parts.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 0 to connect source records, batch evidence, lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 0 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 0.

**Interview-ready definition:** See high-water mark. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

[Back to the glossary top](#)

## Working tree

---

**Plain-language definition:** The checked-out files and current unstaged/staged state on your computer.

**Everyday analogy:** Like a labeled part of a store or delivery process: the label tells you what belongs there and how it connects to other parts.

**Northstar Retail example:** In Northstar Retail, this term is applied in Phase 1 to connect source records, batch evidence, lakehouse tables, warehouse objects, Power BI results, or Git history.

**Related terms:** See the Phase 1 concept and object walkthroughs, plus neighboring terms in this glossary.

**First phase where it appears:** Phase 1.

**Interview-ready definition:** The checked-out files and current unstaged/staged state on your computer. In a design review, I would connect it to the exact Northstar object, grain, validation, and tradeoff.

# Complete troubleshooting index

[Back to the master table of contents](#)

This index points to detailed repair instructions and does not replace the troubleshooting beside each action.

Tool/area	Error or symptom	Most likely phase	First diagnostic	Detailed repair anchor
Windows paths	<code>`Test-Path`</code> returns <code>`False`</code> or a file opens from the wrong similarly named folder	1	<code>`Get-Location`</code> ; <code>`Test-Path`</code> ; copy path from File Explorer; compare with <code>`git rev-parse --show-toplevel`</code>	<a href="#">Repair</a>
PowerShell	Prompt does not begin with <code>`PS`</code> or command syntax behaves differently	1	Read the window title/prompt; run <code>`\$PSVersionTable.PSVersion`</code>	<a href="#">Repair</a>
PowerShell	Script execution is blocked	2	Read the execution-policy error; run <code>`Get-ExecutionPolicy -List`</code>	<a href="#">Repair</a>
Git	<code>`fatal: not a git repository`</code>	1	<code>`Get-Location`</code> ; <code>`Get-ChildItem -Force`</code> ; <code>`git rev-parse --show-toplevel`</code>	<a href="#">Repair</a>
Git	Working tree contains unexpected modified/untracked files	1	<code>`git status --short`</code> ; targeted <code>`git diff -- path`</code>	<a href="#">Repair</a>
Git	Push rejected because remote contains work	1	<code>`git fetch origin`</code> ; graph log	<a href="#">Repair</a>
GitHub	Branch or commit is not visible on the repository page	1	Compare remote URL, branch name, push output, and GitHub branch selector	<a href="#">Repair</a>
VS Code	<code>`code .`</code> is not recognized	2	Restart terminal; run <code>`Get-Command code -ErrorAction SilentlyContinue`</code>	<a href="#">Repair</a>
VS Code	Wrong Python interpreter selected	5	Command Palette > Python: Select Interpreter; compare path with <code>`.venv`</code>	<a href="#">Repair</a>
Python	<code>`py`</code> or <code>`python`</code> is not recognized	2	Run <code>`Get-Command py,python -ErrorAction SilentlyContinue`</code>	<a href="#">Repair</a>
Virtual environment	Activation script blocked or prompt does not show <code>`.venv`</code>	5	Test <code>`.venv\Scripts\Activate.ps1`</code> ; inspect policy and interpreter path	<a href="#">Repair</a>
Package installation	<code>`ModuleNotFoundError`</code> after <code>`pip install`</code>	5	Run <code>`python -m pip --version`</code> and <code>`python -c "import sys; print(sys.executable)"`</code>	<a href="#">Repair</a>
SQL Server	Server/instance cannot be found	2	Inspect SQL Server Configuration Manager/services; SSMS Browse; record exact instance	<a href="#">Repair</a>
SSMS	Login failed for user	2	Identify Windows vs SQL authentication and exact server; check service status	<a href="#">Repair</a>
SSMS	Object already exists	4	Inspect Object Explorer and metadata definition	<a href="#">Repair</a>
PostgreSQL	Connection refused on port 5432	2	Check PostgreSQL service, host, port, and <code>`pg_isready`</code> if available	<a href="#">Repair</a>
pgAdmin	Server appears but remains disconnected	2	Right-click server > Connect Server; inspect host/port/user and first error	<a href="#">Repair</a>
ODBC	Data source name/driver not found	2	Python: <code>`pyodbc.drivers()`</code> ; compare exact driver string	<a href="#">Repair</a>
Database authentication	Python loader authenticates differently from GUI	6	Print non-secret connection mode/server/database; test minimal query with same account	<a href="#">Repair</a>

Tool/area	Error or symptom	Most likely phase	First diagnostic	Detailed repair anchor
Synthetic generator	Foreign-key generation fails or child references are missing	5	Inspect generation order, parent ID sets, seed/config, first invalid row	<a href="#">Repair</a>
Synthetic generator	Rerun produces different results with same configuration	5	Compare seed, package versions, config, timestamps, unordered sets	<a href="#">Repair</a>
Source loading	Primary-key violation on rerun	6	Inspect load audit/batch ID and existing row counts	<a href="#">Repair</a>
Extraction	Watermark advances after a failed/partial batch	7	Inspect attempt status, manifest completion, and saved watermark	<a href="#">Repair</a>
Extraction	Manifest count or checksum differs	7	Recount source/output; recompute checksum; compare file path and byte size	<a href="#">Repair</a>
Databricks	Workspace menu/label differs	8	Identify cloud, workspace tier, permissions, and current official docs	<a href="#">Repair</a>
Databricks	Catalog/schema/volume permission denied	8	Inspect current user, object owner, grants, writable default catalog/My Files	<a href="#">Repair</a>
Databricks	Compute option unavailable	8	Check serverless/classic availability, quotas, entitlement, workspace status	<a href="#">Repair</a>
PySpark	'AnalysisException' table or column not found	9	Print computed table name, 'SHOW TABLES', and 'printSchema()'	<a href="#">Repair</a>
Delta Lake	Same-batch rerun duplicates rows	9	Count by batch and business-event key before/after rerun	<a href="#">Repair</a>
Silver	Input count does not equal accepted plus rejected	10	Break out parse failures, duplicates, filters, joins, and null behavior	<a href="#">Repair</a>
SCD2	Multiple current dimension rows per business key	11	Group by business key where 'is_current'; inspect merge match condition	<a href="#">Repair</a>
SCD2	Effective date windows overlap	11	Self-join versions or use lag/lead validation	<a href="#">Repair</a>
Gold facts	Unknown key 0 rate is unexpectedly high	12	Group unresolved lookups by source key, dimension, and event date	<a href="#">Repair</a>
Quality gate	Test is green but reads the wrong batch/table	13	Print fully qualified object and batch parameter in result record	<a href="#">Repair</a>
Databricks Jobs	Task failed and dependent tasks skipped	14	Open task output and first caused-by exception; inspect parameters and compute	<a href="#">Repair</a>
Databricks Jobs	Retry repeats deterministic quality failure	14	Compare attempts and identical failure data	<a href="#">Repair</a>
Warehouse publication	Downloaded Gold file belongs to wrong run	15	Compare batch ID, manifest, filename, checksum, export timestamp	<a href="#">Repair</a>
SQL Server warehouse	String truncation or decimal/date conversion failure	15	Load staging with raw value visibility; inspect max lengths and invalid examples	<a href="#">Repair</a>
Power BI connections	SQL Server certificate/encryption warning or connection failure	16	Verify server/database/authentication and Microsoft connector guidance	<a href="#">Repair</a>
Power BI relationships	Duplicate values on the one side prevent relationship	16	Profile candidate dimension key and count duplicates/nulls	<a href="#">Repair</a>
DAX	Measure differs from SQL	16	Match date role, filters, relationships, distinct grain, numerator/denominator and rounding	<a href="#">Repair</a>
Power BI report	Slicer does not affect a visual	17	Use Edit interactions and inspect relationship path	<a href="#">Repair</a>

Tool/area	Error or symptom	Most likely phase	First diagnostic	Detailed repair anchor
Power BI report	Snapshot inventory is overstated across dates	17	Inspect visual axis and aggregation of snapshot balance	<a href="#">Repair</a>
Secrets	<code>.env`</code> or token appears in <code>`git status`/diff</code>	18	<code>`git check-ignore -v`</code> ; inspect staged diff and history	<a href="#">Repair</a>
Cost	Databricks compute continues running	18	Open Compute and Job run pages; inspect active resources	<a href="#">Repair</a>
GitHub Actions	Workflow file is ignored or not listed	19	Confirm path <code>.github/workflows/*.yaml`</code> , branch, YAML syntax, Actions permissions	<a href="#">Repair</a>
GitHub Actions	Tests pass locally but fail on runner	19	Compare Python version, OS, paths/case, dependency lock, environment assumptions	<a href="#">Repair</a>
Markdown	README links or anchors are broken	20	Run link validator; preview in VS Code and GitHub	<a href="#">Repair</a>
Portfolio	Claim has no verified evidence	20	Use claim-to-evidence map and locate commit/run/query/screenshot	<a href="#">Repair</a>
Interview	Answer sounds memorized and cannot survive follow-up	21	Trace answer to one actual file, object, test, error, and tradeoff	<a href="#">Repair</a>
Optional extension	Extension breaks required path	22	Compare branch, config, costs, dependencies, rollback plan	<a href="#">Repair</a>

## Troubleshooting 1 — Windows paths: Test-Path returns False or a file opens from the wrong similarly named folder

### Exact or representative message/symptom:

``Test-Path`returnsFalse` or a file opens from the wrong similarly named folder

### What it means in plain language:

The observed application state does not match the expected context, object, data contract, permission, parameter, or verification condition.

### Most likely cause:

A wrong path/context, missing prerequisite, version/tier difference, invalid source value, non-idempotent rerun, or unsafe assumption in Phase 1.

### What not to do:

Do not delete, reset, overwrite, force-push, disable integrity rules, weaken a quality threshold, edit raw evidence, or expose a secret merely to remove the symptom.

### First diagnostic action:

`Get-Location``; ``Test-Path``; copy path from File Explorer; compare with ``git rev-parse --show-toplevel``

### How to read the diagnostic result:

- **If it identifies the expected object/context:** Inspect the next closest dependency, parameter, data grain, or permission.
- **If it identifies a different object/context:** Stop. Correct the location before rerunning anything that changes state.
- **If the diagnostic itself fails:** Verify the tool/service is installed/running and use its official documentation entry in this workbook.

### Safest fix:

Correct only the path/name. Do not copy or delete until the real root is proven.

### Alternative fix when applicable:

Use a documented, isolated development reset or fallback only after preserving the current state and confirming that no needed work/data will be lost.

### How to verify the fix:

Repeat the original smallest verification, then rerun only the failed action. Compare actual/expected values and record the result.

**How to return to the main tutorial:**

Return to Phase 1, find the exact action that produced the symptom, and complete its Do not continue unless gate.

[Back to the troubleshooting index](#)

## Troubleshooting 2 — PowerShell: Prompt does not begin with PS or command syntax behaves differently

---

**Exact or representative message/symptom:**

Prompt does not begin with PS or command syntax behaves differently

**What it means in plain language:**

The observed application state does not match the expected context, object, data contract, permission, parameter, or verification condition.

**Most likely cause:**

A wrong path/context, missing prerequisite, version/tier difference, invalid source value, non-idempotent rerun, or unsafe assumption in Phase 1.

**What not to do:**

Do not delete, reset, overwrite, force-push, disable integrity rules, weaken a quality threshold, edit raw evidence, or expose a secret merely to remove the symptom.

**First diagnostic action:**

Read the window title/prompt; run `$PSVersionTable.PSVersion`

**How to read the diagnostic result:**

- **If it identifies the expected object/context:** Inspect the next closest dependency, parameter, data grain, or permission.
- **If it identifies a different object/context:** Stop. Correct the location before rerunning anything that changes state.
- **If the diagnostic itself fails:** Verify the tool/service is installed/running and use its official documentation entry in this workbook.

**Safest fix:**

Open Windows PowerShell/PowerShell explicitly and rerun the observational check.

**Alternative fix when applicable:**

Use a documented, isolated development reset or fallback only after preserving the current state and confirming that no needed work/data will be lost.

**How to verify the fix:**

Repeat the original smallest verification, then rerun only the failed action. Compare actual/expected values and record the result.

**How to return to the main tutorial:**

Return to Phase 1, find the exact action that produced the symptom, and complete its Do not continue unless gate.

[Back to the troubleshooting index](#)

## Troubleshooting 3 — PowerShell: Script execution is blocked

---

**Exact or representative message/symptom:**

Script execution is blocked

**What it means in plain language:**

The observed application state does not match the expected context, object, data contract, permission, parameter, or verification condition.

**Most likely cause:**

A wrong path/context, missing prerequisite, version/tier difference, invalid source value, non-idempotent rerun, or unsafe assumption in Phase 2.

**What not to do:**

Do not delete, reset, overwrite, force-push, disable integrity rules, weaken a quality threshold, edit raw evidence, or expose a secret merely to remove the symptom.

**First diagnostic action:**

Read the execution-policy error; run `Get-ExecutionPolicy -List``

**How to read the diagnostic result:**

- **If it identifies the expected object/context:** Inspect the next closest dependency, parameter, data grain, or permission.
- **If it identifies a different object/context:** Stop. Correct the location before rerunning anything that changes state.
- **If the diagnostic itself fails:** Verify the tool/service is installed/running and use its official documentation entry in this workbook.

**Safest fix:**

Use the narrow process-scope policy only when required and authorized; do not weaken machine policy globally.

**Alternative fix when applicable:**

Use a documented, isolated development reset or fallback only after preserving the current state and confirming that no needed work/data will be lost.

**How to verify the fix:**

Repeat the original smallest verification, then rerun only the failed action. Compare actual/expected values and record the result.

**How to return to the main tutorial:**

Return to Phase 2, find the exact action that produced the symptom, and complete its `Do not continue unless gate`.

[Back to the troubleshooting index](#)

## Troubleshooting 4 — Git: fatal: not a git repository

---

**Exact or representative message/symptom:**

`fatal: not a git repository`

**What it means in plain language:**

The observed application state does not match the expected context, object, data contract, permission, parameter, or verification condition.

**Most likely cause:**

A wrong path/context, missing prerequisite, version/tier difference, invalid source value, non-idempotent rerun, or unsafe assumption in Phase 1.

**What not to do:**

Do not delete, reset, overwrite, force-push, disable integrity rules, weaken a quality threshold, edit raw evidence, or expose a secret merely to remove the symptom.

**First diagnostic action:**

`Get-Location`; `Get-ChildItem -Force`; `git rev-parse --show-toplevel`

**How to read the diagnostic result:**

- **If it identifies the expected object/context:** Inspect the next closest dependency, parameter, data grain, or permission.
- **If it identifies a different object/context:** Stop. Correct the location before rerunning anything that changes state.
- **If the diagnostic itself fails:** Verify the tool/service is installed/running and use its official documentation entry in this workbook.

**Safest fix:**

Move to the actual clone; do not initialize a second repository inside it.

**Alternative fix when applicable:**

Use a documented, isolated development reset or fallback only after preserving the current state and confirming that no needed work/data will be lost.

**How to verify the fix:**

Repeat the original smallest verification, then rerun only the failed action. Compare actual/expected values and record the result.

**How to return to the main tutorial:**

Return to Phase 1, find the exact action that produced the symptom, and complete its `Do not continue unless gate`.

[Back to the troubleshooting index](#)

## Troubleshooting 5 — Git: Working tree contains unexpected modified/untracked files

---

### Exact or representative message/symptom:

Working tree contains unexpected modified/untracked files

### What it means in plain language:

The observed application state does not match the expected context, object, data contract, permission, parameter, or verification condition.

### Most likely cause:

A wrong path/context, missing prerequisite, version/tier difference, invalid source value, non-idempotent rerun, or unsafe assumption in Phase 1.

### What not to do:

Do not delete, reset, overwrite, force-push, disable integrity rules, weaken a quality threshold, edit raw evidence, or expose a secret merely to remove the symptom.

### First diagnostic action:

```
git status --short`; targeted `git diff -- path
```

### How to read the diagnostic result:

- **If it identifies the expected object/context:** Inspect the next closest dependency, parameter, data grain, or permission.
- **If it identifies a different object/context:** Stop. Correct the location before rerunning anything that changes state.
- **If the diagnostic itself fails:** Verify the tool/service is installed/running and use its official documentation entry in this workbook.

### Safest fix:

Preserve and inspect. Stage only intended files; do not reset or clean blindly.

### Alternative fix when applicable:

Use a documented, isolated development reset or fallback only after preserving the current state and confirming that no needed work/data will be lost.

### How to verify the fix:

Repeat the original smallest verification, then rerun only the failed action. Compare actual/expected values and record the result.

### How to return to the main tutorial:

Return to Phase 1, find the exact action that produced the symptom, and complete its Do not continue unless gate.

[Back to the troubleshooting index](#)

## Troubleshooting 6 — Git: Push rejected because remote contains work

---

### Exact or representative message/symptom:

Push rejected because remote contains work

### What it means in plain language:

The observed application state does not match the expected context, object, data contract, permission, parameter, or verification condition.

### Most likely cause:

A wrong path/context, missing prerequisite, version/tier difference, invalid source value, non-idempotent rerun, or unsafe assumption in Phase 1.

### What not to do:

Do not delete, reset, overwrite, force-push, disable integrity rules, weaken a quality threshold, edit raw evidence, or expose a secret merely to remove the symptom.

### First diagnostic action:

```
``git fetch origin; graph log
```

### How to read the diagnostic result:

- **If it identifies the expected object/context:** Inspect the next closest dependency, parameter, data grain, or permission.
- **If it identifies a different object/context:** Stop. Correct the location before rerunning anything that changes state.
- **If the diagnostic itself fails:** Verify the tool/service is installed/running and use its official documentation entry in this workbook.

### Safest fix:

Integrate remote changes safely; never force-push an unexplained divergence.

### Alternative fix when applicable:

Use a documented, isolated development reset or fallback only after preserving the current state and confirming that no needed work/data will be lost.

### How to verify the fix:

Repeat the original smallest verification, then rerun only the failed action. Compare actual/expected values and record the result.

### How to return to the main tutorial:

Return to Phase 1, find the exact action that produced the symptom, and complete its `Do not continue unless gate`.

[Back to the troubleshooting index](#)

## Troubleshooting 7 — GitHub: Branch or commit is not visible on the repository page

---

### Exact or representative message/symptom:

Branch or commit is not visible on the repository page

### What it means in plain language:

The observed application state does not match the expected context, object, data contract, permission, parameter, or verification condition.

### Most likely cause:

A wrong path/context, missing prerequisite, version/tier difference, invalid source value, non-idempotent rerun, or unsafe assumption in Phase 1.

### What not to do:

Do not delete, reset, overwrite, force-push, disable integrity rules, weaken a quality threshold, edit raw evidence, or expose a secret merely to remove the symptom.

### First diagnostic action:

Compare remote URL, branch name, push output, and GitHub branch selector

### How to read the diagnostic result:

- **If it identifies the expected object/context:** Inspect the next closest dependency, parameter, data grain, or permission.
- **If it identifies a different object/context:** Stop. Correct the location before rerunning anything that changes state.
- **If the diagnostic itself fails:** Verify the tool/service is installed/running and use its official documentation entry in this workbook.

### Safest fix:

Push the correct branch to the correct remote; verify account/repository before retrying.

### Alternative fix when applicable:

Use a documented, isolated development reset or fallback only after preserving the current state and confirming that no needed work/data will be lost.

### How to verify the fix:

Repeat the original smallest verification, then rerun only the failed action. Compare actual/expected values and record the result.

### How to return to the main tutorial:

Return to Phase 1, find the exact action that produced the symptom, and complete its `Do not continue unless gate`.

[Back to the troubleshooting index](#)

## Troubleshooting 8 — VS Code: `code .` is not recognized

---

### Exact or representative message/symptom:

`code .` is not recognized

### What it means in plain language:

The observed application state does not match the expected context, object, data contract, permission, parameter, or verification condition.

### Most likely cause:

A wrong path/context, missing prerequisite, version/tier difference, invalid source value, non-idempotent rerun, or unsafe assumption in Phase 2.

### What not to do:

Do not delete, reset, overwrite, force-push, disable integrity rules, weaken a quality threshold, edit raw evidence, or expose a secret merely to remove the symptom.

### First diagnostic action:

Restart terminal; run `Get-Command code -ErrorAction SilentlyContinue`

### How to read the diagnostic result:

- **If it identifies the expected object/context:** Inspect the next closest dependency, parameter, data grain, or permission.
- **If it identifies a different object/context:** Stop. Correct the location before rerunning anything that changes state.
- **If the diagnostic itself fails:** Verify the tool/service is installed/running and use its official documentation entry in this workbook.

### Safest fix:

Install/repair VS Code PATH option or open the folder through File > Open Folder.

### Alternative fix when applicable:

Use a documented, isolated development reset or fallback only after preserving the current state and confirming that no needed work/data will be lost.

### How to verify the fix:

Repeat the original smallest verification, then rerun only the failed action. Compare actual/expected values and record the result.

### How to return to the main tutorial:

Return to Phase 2, find the exact action that produced the symptom, and complete its `Do not continue unless gate`.

[Back to the troubleshooting index](#)

## Troubleshooting 9 — VS Code: Wrong Python interpreter selected

---

### Exact or representative message/symptom:

Wrong Python interpreter selected

### What it means in plain language:

The observed application state does not match the expected context, object, data contract, permission, parameter, or verification condition.

### Most likely cause:

A wrong path/context, missing prerequisite, version/tier difference, invalid source value, non-idempotent rerun, or unsafe assumption in Phase 5.

### What not to do:

Do not delete, reset, overwrite, force-push, disable integrity rules, weaken a quality threshold, edit raw evidence, or expose a secret merely to remove the symptom.

### First diagnostic action:

Command Palette > Python: Select Interpreter; compare path with `.venv`

### How to read the diagnostic result:

- **If it identifies the expected object/context:** Inspect the next closest dependency, parameter, data grain, or permission.
- **If it identifies a different object/context:** Stop. Correct the location before rerunning anything that changes state.

- **If the diagnostic itself fails:** Verify the tool/service is installed/running and use its official documentation entry in this workbook.

**Safest fix:**

Select the repository `.venv` interpreter and reopen terminal.

**Alternative fix when applicable:**

Use a documented, isolated development reset or fallback only after preserving the current state and confirming that no needed work/data will be lost.

**How to verify the fix:**

Repeat the original smallest verification, then rerun only the failed action. Compare actual/expected values and record the result.

**How to return to the main tutorial:**

Return to Phase 5, find the exact action that produced the symptom, and complete its `Do not continue unless gate`.

[Back to the troubleshooting index](#)

## Troubleshooting 10 — Python: `py` or `python` is not recognized

---

**Exact or representative message/symptom:**

```
``pyorpython is not recognized
```

**What it means in plain language:**

The observed application state does not match the expected context, object, data contract, permission, parameter, or verification condition.

**Most likely cause:**

A wrong path/context, missing prerequisite, version/tier difference, invalid source value, non-idempotent rerun, or unsafe assumption in Phase 2.

**What not to do:**

Do not delete, reset, overwrite, force-push, disable integrity rules, weaken a quality threshold, edit raw evidence, or expose a secret merely to remove the symptom.

**First diagnostic action:**

Run `Get-Command py,python -ErrorAction SilentlyContinue`

**How to read the diagnostic result:**

- **If it identifies the expected object/context:** Inspect the next closest dependency, parameter, data grain, or permission.
- **If it identifies a different object/context:** Stop. Correct the location before rerunning anything that changes state.
- **If the diagnostic itself fails:** Verify the tool/service is installed/running and use its official documentation entry in this workbook.

**Safest fix:**

Install/repair the official Python Windows installation and restart the console.

**Alternative fix when applicable:**

Use a documented, isolated development reset or fallback only after preserving the current state and confirming that no needed work/data will be lost.

**How to verify the fix:**

Repeat the original smallest verification, then rerun only the failed action. Compare actual/expected values and record the result.

**How to return to the main tutorial:**

Return to Phase 2, find the exact action that produced the symptom, and complete its `Do not continue unless gate`.

[Back to the troubleshooting index](#)

## Troubleshooting 11 — Virtual environment: Activation script blocked or prompt does not show `.venv`

---

**Exact or representative message/symptom:**

```
Activation script blocked or prompt does not show .venv``
```

**What it means in plain language:**

The observed application state does not match the expected context, object, data contract, permission, parameter, or verification condition.

**Most likely cause:**

A wrong path/context, missing prerequisite, version/tier difference, invalid source value, non-idempotent rerun, or unsafe assumption in Phase 5.

**What not to do:**

Do not delete, reset, overwrite, force-push, disable integrity rules, weaken a quality threshold, edit raw evidence, or expose a secret merely to remove the symptom.

**First diagnostic action:**

Test `.venv\Scripts\Activate.ps1`; inspect policy and interpreter path

**How to read the diagnostic result:**

- **If it identifies the expected object/context:** Inspect the next closest dependency, parameter, data grain, or permission.
- **If it identifies a different object/context:** Stop. Correct the location before rerunning anything that changes state.
- **If the diagnostic itself fails:** Verify the tool/service is installed/running and use its official documentation entry in this workbook.

**Safest fix:**

Use process-scope policy if permitted or call `.venv\Scripts\python.exe` directly.

**Alternative fix when applicable:**

Use a documented, isolated development reset or fallback only after preserving the current state and confirming that no needed work/data will be lost.

**How to verify the fix:**

Repeat the original smallest verification, then rerun only the failed action. Compare actual/expected values and record the result.

**How to return to the main tutorial:**

Return to Phase 5, find the exact action that produced the symptom, and complete its `Do not continue unless gate`.

[Back to the troubleshooting index](#)

## Troubleshooting 12 — Package installation: `ModuleNotFoundError` after `pip install`

---

**Exact or representative message/symptom:**

`ModuleNotFoundError` after `pip install`

**What it means in plain language:**

The observed application state does not match the expected context, object, data contract, permission, parameter, or verification condition.

**Most likely cause:**

A wrong path/context, missing prerequisite, version/tier difference, invalid source value, non-idempotent rerun, or unsafe assumption in Phase 5.

**What not to do:**

Do not delete, reset, overwrite, force-push, disable integrity rules, weaken a quality threshold, edit raw evidence, or expose a secret merely to remove the symptom.

**First diagnostic action:**

Run `python -m pip --version` and `python -c "import sys; print(sys.executable)"`

**How to read the diagnostic result:**

- **If it identifies the expected object/context:** Inspect the next closest dependency, parameter, data grain, or permission.
- **If it identifies a different object/context:** Stop. Correct the location before rerunning anything that changes state.
- **If the diagnostic itself fails:** Verify the tool/service is installed/running and use its official documentation entry in this workbook.

**Safest fix:**

Install with the same interpreter: `python -m pip install ...`; do not mix global and venv pip.

**Alternative fix when applicable:**

Use a documented, isolated development reset or fallback only after preserving the current state and confirming that no needed work/data will be lost.

**How to verify the fix:**

Repeat the original smallest verification, then rerun only the failed action. Compare actual/expected values and record the result.

**How to return to the main tutorial:**

Return to Phase 5, find the exact action that produced the symptom, and complete its `Do not continue unless gate`.

[Back to the troubleshooting index](#)

## Troubleshooting 13 — SQL Server: Server/instance cannot be found

---

**Exact or representative message/symptom:**

Server/instance cannot be found

**What it means in plain language:**

The observed application state does not match the expected context, object, data contract, permission, parameter, or verification condition.

**Most likely cause:**

A wrong path/context, missing prerequisite, version/tier difference, invalid source value, non-idempotent rerun, or unsafe assumption in Phase 2.

**What not to do:**

Do not delete, reset, overwrite, force-push, disable integrity rules, weaken a quality threshold, edit raw evidence, or expose a secret merely to remove the symptom.

**First diagnostic action:**

Inspect SQL Server Configuration Manager/services; SSMS Browse; record exact instance

**How to read the diagnostic result:**

- **If it identifies the expected object/context:** Inspect the next closest dependency, parameter, data grain, or permission.
- **If it identifies a different object/context:** Stop. Correct the location before rerunning anything that changes state.
- **If the diagnostic itself fails:** Verify the tool/service is installed/running and use its official documentation entry in this workbook.

**Safest fix:**

Start the intended service or use the exact installed instance name; do not guess `localhost` variants indefinitely.

**Alternative fix when applicable:**

Use a documented, isolated development reset or fallback only after preserving the current state and confirming that no needed work/data will be lost.

**How to verify the fix:**

Repeat the original smallest verification, then rerun only the failed action. Compare actual/expected values and record the result.

**How to return to the main tutorial:**

Return to Phase 2, find the exact action that produced the symptom, and complete its `Do not continue unless gate`.

[Back to the troubleshooting index](#)

## Troubleshooting 14 — SSMS: Login failed for user

---

**Exact or representative message/symptom:**

Login failed for user

**What it means in plain language:**

The observed application state does not match the expected context, object, data contract, permission, parameter, or verification condition.

**Most likely cause:**

A wrong path/context, missing prerequisite, version/tier difference, invalid source value, non-idempotent rerun, or unsafe assumption in Phase 2.

**What not to do:**

Do not delete, reset, overwrite, force-push, disable integrity rules, weaken a quality threshold, edit raw evidence, or expose a secret merely to remove the symptom.

**First diagnostic action:**

Identify Windows vs SQL authentication and exact server; check service status

**How to read the diagnostic result:**

- **If it identifies the expected object/context:** Inspect the next closest dependency, parameter, data grain, or permission.
- **If it identifies a different object/context:** Stop. Correct the location before rerunning anything that changes state.
- **If the diagnostic itself fails:** Verify the tool/service is installed/running and use its official documentation entry in this workbook.

**Safest fix:**

Use the authentication mode configured during install; do not expose passwords in screenshots/config.

**Alternative fix when applicable:**

Use a documented, isolated development reset or fallback only after preserving the current state and confirming that no needed work/data will be lost.

**How to verify the fix:**

Repeat the original smallest verification, then rerun only the failed action. Compare actual/expected values and record the result.

**How to return to the main tutorial:**

Return to Phase 2, find the exact action that produced the symptom, and complete its `Do not continue unless gate`.

[Back to the troubleshooting index](#)

## Troubleshooting 15 — SSMS: Object already exists

---

**Exact or representative message/symptom:**

Object already exists

**What it means in plain language:**

The observed application state does not match the expected context, object, data contract, permission, parameter, or verification condition.

**Most likely cause:**

A wrong path/context, missing prerequisite, version/tier difference, invalid source value, non-idempotent rerun, or unsafe assumption in Phase 4.

**What not to do:**

Do not delete, reset, overwrite, force-push, disable integrity rules, weaken a quality threshold, edit raw evidence, or expose a secret merely to remove the symptom.

**First diagnostic action:**

Inspect Object Explorer and metadata definition

**How to read the diagnostic result:**

- **If it identifies the expected object/context:** Inspect the next closest dependency, parameter, data grain, or permission.
- **If it identifies a different object/context:** Stop. Correct the location before rerunning anything that changes state.
- **If the diagnostic itself fails:** Verify the tool/service is installed/running and use its official documentation entry in this workbook.

**Safest fix:**

Compare existing definition and preserve data; run idempotent script or documented reset only when safe.

**Alternative fix when applicable:**

Use a documented, isolated development reset or fallback only after preserving the current state and confirming that no needed work/data will be lost.

**How to verify the fix:**

Repeat the original smallest verification, then rerun only the failed action. Compare actual/expected values and record the result.

**How to return to the main tutorial:**

Return to Phase 4, find the exact action that produced the symptom, and complete its `Do not continue unless` gate.

[Back to the troubleshooting index](#)

## Troubleshooting 16 — PostgreSQL: Connection refused on port 5432

---

**Exact or representative message/symptom:**

Connection refused on port 5432

**What it means in plain language:**

The observed application state does not match the expected context, object, data contract, permission, parameter, or verification condition.

**Most likely cause:**

A wrong path/context, missing prerequisite, version/tier difference, invalid source value, non-idempotent rerun, or unsafe assumption in Phase 2.

**What not to do:**

Do not delete, reset, overwrite, force-push, disable integrity rules, weaken a quality threshold, edit raw evidence, or expose a secret merely to remove the symptom.

**First diagnostic action:**

Check PostgreSQL service, host, port, and `pg_isready` if available

**How to read the diagnostic result:**

- **If it identifies the expected object/context:** Inspect the next closest dependency, parameter, data grain, or permission.
- **If it identifies a different object/context:** Stop. Correct the location before rerunning anything that changes state.
- **If the diagnostic itself fails:** Verify the tool/service is installed/running and use its official documentation entry in this workbook.

**Safest fix:**

Start the intended service or correct the port; do not reinstall before checking service/config.

**Alternative fix when applicable:**

Use a documented, isolated development reset or fallback only after preserving the current state and confirming that no needed work/data will be lost.

**How to verify the fix:**

Repeat the original smallest verification, then rerun only the failed action. Compare actual/expected values and record the result.

**How to return to the main tutorial:**

Return to Phase 2, find the exact action that produced the symptom, and complete its `Do not continue unless` gate.

[Back to the troubleshooting index](#)

## Troubleshooting 17 — pgAdmin: Server appears but remains disconnected

---

**Exact or representative message/symptom:**

Server appears but remains disconnected

**What it means in plain language:**

The observed application state does not match the expected context, object, data contract, permission, parameter, or verification condition.

**Most likely cause:**

A wrong path/context, missing prerequisite, version/tier difference, invalid source value, non-idempotent rerun, or unsafe assumption in Phase 2.

**What not to do:**

Do not delete, reset, overwrite, force-push, disable integrity rules, weaken a quality threshold, edit raw evidence, or expose a secret merely to remove the symptom.

**First diagnostic action:**

Right-click server > Connect Server; inspect host/port/user and first error

**How to read the diagnostic result:**

- **If it identifies the expected object/context:** Inspect the next closest dependency, parameter, data grain, or permission.
- **If it identifies a different object/context:** Stop. Correct the location before rerunning anything that changes state.
- **If the diagnostic itself fails:** Verify the tool/service is installed/running and use its official documentation entry in this workbook.

**Safest fix:**

Correct the connection property or password; avoid saving credentials on shared machines.

**Alternative fix when applicable:**

Use a documented, isolated development reset or fallback only after preserving the current state and confirming that no needed work/data will be lost.

**How to verify the fix:**

Repeat the original smallest verification, then rerun only the failed action. Compare actual/expected values and record the result.

**How to return to the main tutorial:**

Return to Phase 2, find the exact action that produced the symptom, and complete its Do not continue unless gate.

[Back to the troubleshooting index](#)

## Troubleshooting 18 — ODBC: Data source name/driver not found

---

**Exact or representative message/symptom:**

Data source name/driver not found

**What it means in plain language:**

The observed application state does not match the expected context, object, data contract, permission, parameter, or verification condition.

**Most likely cause:**

A wrong path/context, missing prerequisite, version/tier difference, invalid source value, non-idempotent rerun, or unsafe assumption in Phase 2.

**What not to do:**

Do not delete, reset, overwrite, force-push, disable integrity rules, weaken a quality threshold, edit raw evidence, or expose a secret merely to remove the symptom.

**First diagnostic action:**

Python: `pyodbc.drivers()`; compare exact driver string

**How to read the diagnostic result:**

- **If it identifies the expected object/context:** Inspect the next closest dependency, parameter, data grain, or permission.
- **If it identifies a different object/context:** Stop. Correct the location before rerunning anything that changes state.
- **If the diagnostic itself fails:** Verify the tool/service is installed/running and use its official documentation entry in this workbook.

**Safest fix:**

Install current 64-bit Microsoft ODBC driver and restart applications; use exact returned name.

**Alternative fix when applicable:**

Use a documented, isolated development reset or fallback only after preserving the current state and confirming that no needed work/data will be lost.

**How to verify the fix:**

Repeat the original smallest verification, then rerun only the failed action. Compare actual/expected values and record the result.

**How to return to the main tutorial:**

Return to Phase 2, find the exact action that produced the symptom, and complete its Do not continue unless gate.

[Back to the troubleshooting index](#)

## Troubleshooting 19 — Database authentication: Python loader authenticates differently from GUI

---

### Exact or representative message/symptom:

Python loader authenticates differently from GUI

### What it means in plain language:

The observed application state does not match the expected context, object, data contract, permission, parameter, or verification condition.

### Most likely cause:

A wrong path/context, missing prerequisite, version/tier difference, invalid source value, non-idempotent rerun, or unsafe assumption in Phase 6.

### What not to do:

Do not delete, reset, overwrite, force-push, disable integrity rules, weaken a quality threshold, edit raw evidence, or expose a secret merely to remove the symptom.

### First diagnostic action:

Print non-secret connection mode/server/database; test minimal query with same account

### How to read the diagnostic result:

- **If it identifies the expected object/context:** Inspect the next closest dependency, parameter, data grain, or permission.
- **If it identifies a different object/context:** Stop. Correct the location before rerunning anything that changes state.
- **If the diagnostic itself fails:** Verify the tool/service is installed/running and use its official documentation entry in this workbook.

### Safest fix:

Align driver/authentication settings and environment variables; do not hard-code credentials.

### Alternative fix when applicable:

Use a documented, isolated development reset or fallback only after preserving the current state and confirming that no needed work/data will be lost.

### How to verify the fix:

Repeat the original smallest verification, then rerun only the failed action. Compare actual/expected values and record the result.

### How to return to the main tutorial:

Return to Phase 6, find the exact action that produced the symptom, and complete its `Do not continue unless gate`.

[Back to the troubleshooting index](#)

## Troubleshooting 20 — Synthetic generator: Foreign-key generation fails or child references are missing

---

### Exact or representative message/symptom:

Foreign-key generation fails or child references are missing

### What it means in plain language:

The observed application state does not match the expected context, object, data contract, permission, parameter, or verification condition.

### Most likely cause:

A wrong path/context, missing prerequisite, version/tier difference, invalid source value, non-idempotent rerun, or unsafe assumption in Phase 5.

### What not to do:

Do not delete, reset, overwrite, force-push, disable integrity rules, weaken a quality threshold, edit raw evidence, or expose a secret merely to remove the symptom.

### First diagnostic action:

Inspect generation order, parent ID sets, seed/config, first invalid row

### How to read the diagnostic result:

- **If it identifies the expected object/context:** Inspect the next closest dependency, parameter, data grain, or permission.
- **If it identifies a different object/context:** Stop. Correct the location before rerunning anything that changes state.
- **If the diagnostic itself fails:** Verify the tool/service is installed/running and use its official documentation entry in this workbook.

### Safest fix:

Generate parent entities before children and rerun to a new clean output batch.

### Alternative fix when applicable:

Use a documented, isolated development reset or fallback only after preserving the current state and confirming that no needed work/data will be lost.

### How to verify the fix:

Repeat the original smallest verification, then rerun only the failed action. Compare actual/expected values and record the result.

### How to return to the main tutorial:

Return to Phase 5, find the exact action that produced the symptom, and complete its `Do not continue unless` gate.

[Back to the troubleshooting index](#)

## Troubleshooting 21 — Synthetic generator: Rerun produces different results with same configuration

---

### Exact or representative message/symptom:

Rerun produces different results with same configuration

### What it means in plain language:

The observed application state does not match the expected context, object, data contract, permission, parameter, or verification condition.

### Most likely cause:

A wrong path/context, missing prerequisite, version/tier difference, invalid source value, non-idempotent rerun, or unsafe assumption in Phase 5.

### What not to do:

Do not delete, reset, overwrite, force-push, disable integrity rules, weaken a quality threshold, edit raw evidence, or expose a secret merely to remove the symptom.

### First diagnostic action:

Compare seed, package versions, config, timestamps, unordered sets

### How to read the diagnostic result:

- **If it identifies the expected object/context:** Inspect the next closest dependency, parameter, data grain, or permission.
- **If it identifies a different object/context:** Stop. Correct the location before rerunning anything that changes state.
- **If the diagnostic itself fails:** Verify the tool/service is installed/running and use its official documentation entry in this workbook.

### Safest fix:

Stabilize seeds and deterministic ordering; separate expected run timestamps from deterministic business data.

### Alternative fix when applicable:

Use a documented, isolated development reset or fallback only after preserving the current state and confirming that no needed work/data will be lost.

### How to verify the fix:

Repeat the original smallest verification, then rerun only the failed action. Compare actual/expected values and record the result.

### How to return to the main tutorial:

Return to Phase 5, find the exact action that produced the symptom, and complete its `Do not continue unless` gate.

[Back to the troubleshooting index](#)

## Troubleshooting 22 — Source loading: Primary-key violation on rerun

---

### Exact or representative message/symptom:

Primary-key violation on rerun

### What it means in plain language:

The observed application state does not match the expected context, object, data contract, permission, parameter, or verification condition.

### Most likely cause:

A wrong path/context, missing prerequisite, version/tier difference, invalid source value, non-idempotent rerun, or unsafe assumption in Phase 6.

### What not to do:

Do not delete, reset, overwrite, force-push, disable integrity rules, weaken a quality threshold, edit raw evidence, or expose a secret merely to remove the symptom.

### First diagnostic action:

Inspect load audit/batch ID and existing row counts

### How to read the diagnostic result:

- **If it identifies the expected object/context:** Inspect the next closest dependency, parameter, data grain, or permission.
- **If it identifies a different object/context:** Stop. Correct the location before rerunning anything that changes state.
- **If the diagnostic itself fails:** Verify the tool/service is installed/running and use its official documentation entry in this workbook.

### Safest fix:

Use documented reset/upsert/duplicate-batch policy; never silently append.

### Alternative fix when applicable:

Use a documented, isolated development reset or fallback only after preserving the current state and confirming that no needed work/data will be lost.

### How to verify the fix:

Repeat the original smallest verification, then rerun only the failed action. Compare actual/expected values and record the result.

### How to return to the main tutorial:

Return to Phase 6, find the exact action that produced the symptom, and complete its `Do not continue unless gate`.

[Back to the troubleshooting index](#)

## Troubleshooting 23 — Extraction: Watermark advances after a failed/partial batch

---

### Exact or representative message/symptom:

Watermark advances after a failed/partial batch

### What it means in plain language:

The observed application state does not match the expected context, object, data contract, permission, parameter, or verification condition.

### Most likely cause:

A wrong path/context, missing prerequisite, version/tier difference, invalid source value, non-idempotent rerun, or unsafe assumption in Phase 7.

### What not to do:

Do not delete, reset, overwrite, force-push, disable integrity rules, weaken a quality threshold, edit raw evidence, or expose a secret merely to remove the symptom.

### First diagnostic action:

Inspect attempt status, manifest completion, and saved watermark

### How to read the diagnostic result:

- **If it identifies the expected object/context:** Inspect the next closest dependency, parameter, data grain, or permission.

- **If it identifies a different object/context:** Stop. Correct the location before rerunning anything that changes state.
- **If the diagnostic itself fails:** Verify the tool/service is installed/running and use its official documentation entry in this workbook.

**Safest fix:**

Restore prior successful watermark; advance only in the same success transaction/atomic state change.

**Alternative fix when applicable:**

Use a documented, isolated development reset or fallback only after preserving the current state and confirming that no needed work/data will be lost.

**How to verify the fix:**

Repeat the original smallest verification, then rerun only the failed action. Compare actual/expected values and record the result.

**How to return to the main tutorial:**

Return to Phase 7, find the exact action that produced the symptom, and complete its `Do not continue unless` gate.

[Back to the troubleshooting index](#)

## Troubleshooting 24 — Extraction: Manifest count or checksum differs

---

**Exact or representative message/symptom:**

Manifest count or checksum differs

**What it means in plain language:**

The observed application state does not match the expected context, object, data contract, permission, parameter, or verification condition.

**Most likely cause:**

A wrong path/context, missing prerequisite, version/tier difference, invalid source value, non-idempotent rerun, or unsafe assumption in Phase 7.

**What not to do:**

Do not delete, reset, overwrite, force-push, disable integrity rules, weaken a quality threshold, edit raw evidence, or expose a secret merely to remove the symptom.

**First diagnostic action:**

Recount source/output; recompute checksum; compare file path and byte size

**How to read the diagnostic result:**

- **If it identifies the expected object/context:** Inspect the next closest dependency, parameter, data grain, or permission.
- **If it identifies a different object/context:** Stop. Correct the location before rerunning anything that changes state.
- **If the diagnostic itself fails:** Verify the tool/service is installed/running and use its official documentation entry in this workbook.

**Safest fix:**

Discard or quarantine failed batch and re-extract; do not edit manifest to match a bad file.

**Alternative fix when applicable:**

Use a documented, isolated development reset or fallback only after preserving the current state and confirming that no needed work/data will be lost.

**How to verify the fix:**

Repeat the original smallest verification, then rerun only the failed action. Compare actual/expected values and record the result.

**How to return to the main tutorial:**

Return to Phase 7, find the exact action that produced the symptom, and complete its `Do not continue unless` gate.

[Back to the troubleshooting index](#)

## Troubleshooting 25 — Databricks: Workspace menu/label differs

---

**Exact or representative message/symptom:**

Workspace menu/label differs

**What it means in plain language:**

The observed application state does not match the expected context, object, data contract, permission, parameter, or verification condition.

**Most likely cause:**

A wrong path/context, missing prerequisite, version/tier difference, invalid source value, non-idempotent rerun, or unsafe assumption in Phase 8.

**What not to do:**

Do not delete, reset, overwrite, force-push, disable integrity rules, weaken a quality threshold, edit raw evidence, or expose a secret merely to remove the symptom.

**First diagnostic action:**

Identify cloud, workspace tier, permissions, and current official docs

**How to read the diagnostic result:**

- **If it identifies the expected object/context:** Inspect the next closest dependency, parameter, data grain, or permission.
- **If it identifies a different object/context:** Stop. Correct the location before rerunning anything that changes state.
- **If the diagnostic itself fails:** Verify the tool/service is installed/running and use its official documentation entry in this workbook.

**Safest fix:**

Use equivalent object-based path; record variance rather than claiming feature absence.

**Alternative fix when applicable:**

Use a documented, isolated development reset or fallback only after preserving the current state and confirming that no needed work/data will be lost.

**How to verify the fix:**

Repeat the original smallest verification, then rerun only the failed action. Compare actual/expected values and record the result.

**How to return to the main tutorial:**

Return to Phase 8, find the exact action that produced the symptom, and complete its `Do not continue unless gate`.

[Back to the troubleshooting index](#)

## Troubleshooting 26 — Databricks: Catalog/schema/volume permission denied

---

**Exact or representative message/symptom:**

Catalog/schema/volume permission denied

**What it means in plain language:**

The observed application state does not match the expected context, object, data contract, permission, parameter, or verification condition.

**Most likely cause:**

A wrong path/context, missing prerequisite, version/tier difference, invalid source value, non-idempotent rerun, or unsafe assumption in Phase 8.

**What not to do:**

Do not delete, reset, overwrite, force-push, disable integrity rules, weaken a quality threshold, edit raw evidence, or expose a secret merely to remove the symptom.

**First diagnostic action:**

Inspect current user, object owner, grants, writable default catalog/My Files

**How to read the diagnostic result:**

- **If it identifies the expected object/context:** Inspect the next closest dependency, parameter, data grain, or permission.
- **If it identifies a different object/context:** Stop. Correct the location before rerunning anything that changes state.
- **If the diagnostic itself fails:** Verify the tool/service is installed/running and use its official documentation entry in this workbook.

**Safest fix:**

Choose an authorized location or request permission; do not switch to an unknown shared location.

**Alternative fix when applicable:**

Use a documented, isolated development reset or fallback only after preserving the current state and confirming that no needed work/data will be lost.

**How to verify the fix:**

Repeat the original smallest verification, then rerun only the failed action. Compare actual/expected values and record the result.

**How to return to the main tutorial:**

Return to Phase 8, find the exact action that produced the symptom, and complete its `Do not continue unless gate`.

[Back to the troubleshooting index](#)

## Troubleshooting 27 — Databricks: Compute option unavailable

---

**Exact or representative message/symptom:**

Compute option unavailable

**What it means in plain language:**

The observed application state does not match the expected context, object, data contract, permission, parameter, or verification condition.

**Most likely cause:**

A wrong path/context, missing prerequisite, version/tier difference, invalid source value, non-idempotent rerun, or unsafe assumption in Phase 8.

**What not to do:**

Do not delete, reset, overwrite, force-push, disable integrity rules, weaken a quality threshold, edit raw evidence, or expose a secret merely to remove the symptom.

**First diagnostic action:**

Check serverless/classic availability, quotas, entitlement, workspace status

**How to read the diagnostic result:**

- **If it identifies the expected object/context:** Inspect the next closest dependency, parameter, data grain, or permission.
- **If it identifies a different object/context:** Stop. Correct the location before rerunning anything that changes state.
- **If the diagnostic itself fails:** Verify the tool/service is installed/running and use its official documentation entry in this workbook.

**Safest fix:**

Use available supported compute or document blocker; do not create costly resources blindly.

**Alternative fix when applicable:**

Use a documented, isolated development reset or fallback only after preserving the current state and confirming that no needed work/data will be lost.

**How to verify the fix:**

Repeat the original smallest verification, then rerun only the failed action. Compare actual/expected values and record the result.

**How to return to the main tutorial:**

Return to Phase 8, find the exact action that produced the symptom, and complete its `Do not continue unless gate`.

[Back to the troubleshooting index](#)

## Troubleshooting 28 — PySpark: AnalysisException table or column not found

---

**Exact or representative message/symptom:**

`AnalysisException table or column not found`

**What it means in plain language:**

The observed application state does not match the expected context, object, data contract, permission, parameter, or verification condition.

**Most likely cause:**

A wrong path/context, missing prerequisite, version/tier difference, invalid source value, non-idempotent rerun, or unsafe assumption in Phase 9.

**What not to do:**

Do not delete, reset, overwrite, force-push, disable integrity rules, weaken a quality threshold, edit raw evidence, or expose a secret merely to remove the symptom.

**First diagnostic action:**

Print computed table name, SHOW TABLES, and printSchema()

**How to read the diagnostic result:**

- **If it identifies the expected object/context:** Inspect the next closest dependency, parameter, data grain, or permission.
- **If it identifies a different object/context:** Stop. Correct the location before rerunning anything that changes state.
- **If the diagnostic itself fails:** Verify the tool/service is installed/running and use its official documentation entry in this workbook.

**Safest fix:**

Correct catalog/schema/table/column mapping; do not add fake columns to bypass the error.

**Alternative fix when applicable:**

Use a documented, isolated development reset or fallback only after preserving the current state and confirming that no needed work/data will be lost.

**How to verify the fix:**

Repeat the original smallest verification, then rerun only the failed action. Compare actual/expected values and record the result.

**How to return to the main tutorial:**

Return to Phase 9, find the exact action that produced the symptom, and complete its Do not continue unless gate.

[Back to the troubleshooting index](#)

## Troubleshooting 29 — Delta Lake: Same-batch rerun duplicates rows

---

**Exact or representative message/symptom:**

Same-batch rerun duplicates rows

**What it means in plain language:**

The observed application state does not match the expected context, object, data contract, permission, parameter, or verification condition.

**Most likely cause:**

A wrong path/context, missing prerequisite, version/tier difference, invalid source value, non-idempotent rerun, or unsafe assumption in Phase 9.

**What not to do:**

Do not delete, reset, overwrite, force-push, disable integrity rules, weaken a quality threshold, edit raw evidence, or expose a secret merely to remove the symptom.

**First diagnostic action:**

Count by batch and business-event key before/after rerun

**How to read the diagnostic result:**

- **If it identifies the expected object/context:** Inspect the next closest dependency, parameter, data grain, or permission.
- **If it identifies a different object/context:** Stop. Correct the location before rerunning anything that changes state.
- **If the diagnostic itself fails:** Verify the tool/service is installed/running and use its official documentation entry in this workbook.

**Safest fix:**

Implement batch rejection, replaceWhere, merge, or deterministic dedupe and test again.

**Alternative fix when applicable:**

Use a documented, isolated development reset or fallback only after preserving the current state and confirming that no needed work/data will be lost.

**How to verify the fix:**

Repeat the original smallest verification, then rerun only the failed action. Compare actual/expected values and record the result.

**How to return to the main tutorial:**

Return to Phase 9, find the exact action that produced the symptom, and complete its Do not continue unless gate.

[Back to the troubleshooting index](#)

## Troubleshooting 30 — Silver: Input count does not equal accepted plus rejected

---

**Exact or representative message/symptom:**

Input count does not equal accepted plus rejected

**What it means in plain language:**

The observed application state does not match the expected context, object, data contract, permission, parameter, or verification condition.

**Most likely cause:**

A wrong path/context, missing prerequisite, version/tier difference, invalid source value, non-idempotent rerun, or unsafe assumption in Phase 10.

**What not to do:**

Do not delete, reset, overwrite, force-push, disable integrity rules, weaken a quality threshold, edit raw evidence, or expose a secret merely to remove the symptom.

**First diagnostic action:**

Break out parse failures, duplicates, filters, joins, and null behavior

**How to read the diagnostic result:**

- **If it identifies the expected object/context:** Inspect the next closest dependency, parameter, data grain, or permission.
- **If it identifies a different object/context:** Stop. Correct the location before rerunning anything that changes state.
- **If the diagnostic itself fails:** Verify the tool/service is installed/running and use its official documentation entry in this workbook.

**Safest fix:**

Add explicit accounting category/rejection records; eliminate silent drops.

**Alternative fix when applicable:**

Use a documented, isolated development reset or fallback only after preserving the current state and confirming that no needed work/data will be lost.

**How to verify the fix:**

Repeat the original smallest verification, then rerun only the failed action. Compare actual/expected values and record the result.

**How to return to the main tutorial:**

Return to Phase 10, find the exact action that produced the symptom, and complete its Do not continue unless gate.

[Back to the troubleshooting index](#)

## Troubleshooting 31 — SCD2: Multiple current dimension rows per business key

---

**Exact or representative message/symptom:**

Multiple current dimension rows per business key

**What it means in plain language:**

The observed application state does not match the expected context, object, data contract, permission, parameter, or verification condition.

**Most likely cause:**

A wrong path/context, missing prerequisite, version/tier difference, invalid source value, non-idempotent rerun, or unsafe assumption in Phase 11.

**What not to do:**

Do not delete, reset, overwrite, force-push, disable integrity rules, weaken a quality threshold, edit raw evidence, or expose a secret merely to remove the symptom.

**First diagnostic action:**

Group by business key where is\_current; inspect merge match condition

### How to read the diagnostic result:

- **If it identifies the expected object/context:** Inspect the next closest dependency, parameter, data grain, or permission.
- **If it identifies a different object/context:** Stop. Correct the location before rerunning anything that changes state.
- **If the diagnostic itself fails:** Verify the tool/service is installed/running and use its official documentation entry in this workbook.

### Safest fix:

Close prior current row and enforce deterministic one-current-row invariant.

### Alternative fix when applicable:

Use a documented, isolated development reset or fallback only after preserving the current state and confirming that no needed work/data will be lost.

### How to verify the fix:

Repeat the original smallest verification, then rerun only the failed action. Compare actual/expected values and record the result.

### How to return to the main tutorial:

Return to Phase 11, find the exact action that produced the symptom, and complete its `Do not continue unless gate`.

[Back to the troubleshooting index](#)

## Troubleshooting 32 — SCD2: Effective date windows overlap

---

### Exact or representative message/symptom:

Effective date windows overlap

### What it means in plain language:

The observed application state does not match the expected context, object, data contract, permission, parameter, or verification condition.

### Most likely cause:

A wrong path/context, missing prerequisite, version/tier difference, invalid source value, non-idempotent rerun, or unsafe assumption in Phase 11.

### What not to do:

Do not delete, reset, overwrite, force-push, disable integrity rules, weaken a quality threshold, edit raw evidence, or expose a secret merely to remove the symptom.

### First diagnostic action:

Self-join versions or use lag/lead validation

### How to read the diagnostic result:

- **If it identifies the expected object/context:** Inspect the next closest dependency, parameter, data grain, or permission.
- **If it identifies a different object/context:** Stop. Correct the location before rerunning anything that changes state.
- **If the diagnostic itself fails:** Verify the tool/service is installed/running and use its official documentation entry in this workbook.

### Safest fix:

Correct boundary convention and rerun the affected business keys/batch safely.

### Alternative fix when applicable:

Use a documented, isolated development reset or fallback only after preserving the current state and confirming that no needed work/data will be lost.

### How to verify the fix:

Repeat the original smallest verification, then rerun only the failed action. Compare actual/expected values and record the result.

### How to return to the main tutorial:

Return to Phase 11, find the exact action that produced the symptom, and complete its `Do not continue unless gate`.

[Back to the troubleshooting index](#)

## Troubleshooting 33 — Gold facts: Unknown key 0 rate is unexpectedly high

---

### Exact or representative message/symptom:

Unknown key 0 rate is unexpectedly high

### What it means in plain language:

The observed application state does not match the expected context, object, data contract, permission, parameter, or verification condition.

### Most likely cause:

A wrong path/context, missing prerequisite, version/tier difference, invalid source value, non-idempotent rerun, or unsafe assumption in Phase 12.

### What not to do:

Do not delete, reset, overwrite, force-push, disable integrity rules, weaken a quality threshold, edit raw evidence, or expose a secret merely to remove the symptom.

### First diagnostic action:

Group unresolved lookups by source key, dimension, and event date

### How to read the diagnostic result:

- **If it identifies the expected object/context:** Inspect the next closest dependency, parameter, data grain, or permission.
- **If it identifies a different object/context:** Stop. Correct the location before rerunning anything that changes state.
- **If the diagnostic itself fails:** Verify the tool/service is installed/running and use its official documentation entry in this workbook.

### Safest fix:

Repair conformance/late-arriving logic; keep facts countable and monitor rather than dropping.

### Alternative fix when applicable:

Use a documented, isolated development reset or fallback only after preserving the current state and confirming that no needed work/data will be lost.

### How to verify the fix:

Repeat the original smallest verification, then rerun only the failed action. Compare actual/expected values and record the result.

### How to return to the main tutorial:

Return to Phase 12, find the exact action that produced the symptom, and complete its `Do not continue unless gate`.

[Back to the troubleshooting index](#)

## Troubleshooting 34 — Quality gate: Test is green but reads the wrong batch/table

---

### Exact or representative message/symptom:

Test is green but reads the wrong batch/table

### What it means in plain language:

The observed application state does not match the expected context, object, data contract, permission, parameter, or verification condition.

### Most likely cause:

A wrong path/context, missing prerequisite, version/tier difference, invalid source value, non-idempotent rerun, or unsafe assumption in Phase 13.

### What not to do:

Do not delete, reset, overwrite, force-push, disable integrity rules, weaken a quality threshold, edit raw evidence, or expose a secret merely to remove the symptom.

### First diagnostic action:

Print fully qualified object and batch parameter in result record

### How to read the diagnostic result:

- **If it identifies the expected object/context:** Inspect the next closest dependency, parameter, data grain, or permission.

- **If it identifies a different object/context:** Stop. Correct the location before rerunning anything that changes state.
- **If the diagnostic itself fails:** Verify the tool/service is installed/running and use its official documentation entry in this workbook.

**Safest fix:**

Bind test to explicit parameters and store object/batch metadata with actual/expected values.

**Alternative fix when applicable:**

Use a documented, isolated development reset or fallback only after preserving the current state and confirming that no needed work/data will be lost.

**How to verify the fix:**

Repeat the original smallest verification, then rerun only the failed action. Compare actual/expected values and record the result.

**How to return to the main tutorial:**

Return to Phase 13, find the exact action that produced the symptom, and complete its Do not continue unless gate.

[Back to the troubleshooting index](#)

## Troubleshooting 35 — Databricks Jobs: Task failed and dependent tasks skipped

**Exact or representative message/symptom:**

Task failed and dependent tasks skipped

**What it means in plain language:**

The observed application state does not match the expected context, object, data contract, permission, parameter, or verification condition.

**Most likely cause:**

A wrong path/context, missing prerequisite, version/tier difference, invalid source value, non-idempotent rerun, or unsafe assumption in Phase 14.

**What not to do:**

Do not delete, reset, overwrite, force-push, disable integrity rules, weaken a quality threshold, edit raw evidence, or expose a secret merely to remove the symptom.

**First diagnostic action:**

Open task output and first caused-by exception; inspect parameters and compute

**How to read the diagnostic result:**

- **If it identifies the expected object/context:** Inspect the next closest dependency, parameter, data grain, or permission.
- **If it identifies a different object/context:** Stop. Correct the location before rerunning anything that changes state.
- **If the diagnostic itself fails:** Verify the tool/service is installed/running and use its official documentation entry in this workbook.

**Safest fix:**

Fix root cause, then use Repair run for failed/dependent tasks.

**Alternative fix when applicable:**

Use a documented, isolated development reset or fallback only after preserving the current state and confirming that no needed work/data will be lost.

**How to verify the fix:**

Repeat the original smallest verification, then rerun only the failed action. Compare actual/expected values and record the result.

**How to return to the main tutorial:**

Return to Phase 14, find the exact action that produced the symptom, and complete its Do not continue unless gate.

[Back to the troubleshooting index](#)

## Troubleshooting 36 — Databricks Jobs: Retry repeats deterministic quality failure

---

**Exact or representative message/symptom:**

Retry repeats deterministic quality failure

**What it means in plain language:**

The observed application state does not match the expected context, object, data contract, permission, parameter, or verification condition.

**Most likely cause:**

A wrong path/context, missing prerequisite, version/tier difference, invalid source value, non-idempotent rerun, or unsafe assumption in Phase 14.

**What not to do:**

Do not delete, reset, overwrite, force-push, disable integrity rules, weaken a quality threshold, edit raw evidence, or expose a secret merely to remove the symptom.

**First diagnostic action:**

Compare attempts and identical failure data

**How to read the diagnostic result:**

- **If it identifies the expected object/context:** Inspect the next closest dependency, parameter, data grain, or permission.
- **If it identifies a different object/context:** Stop. Correct the location before rerunning anything that changes state.
- **If the diagnostic itself fails:** Verify the tool/service is installed/running and use its official documentation entry in this workbook.

**Safest fix:**

Stop automatic retries for deterministic failures; fix data/code/contract first.

**Alternative fix when applicable:**

Use a documented, isolated development reset or fallback only after preserving the current state and confirming that no needed work/data will be lost.

**How to verify the fix:**

Repeat the original smallest verification, then rerun only the failed action. Compare actual/expected values and record the result.

**How to return to the main tutorial:**

Return to Phase 14, find the exact action that produced the symptom, and complete its `Do not continue unless gate`.

[Back to the troubleshooting index](#)

## Troubleshooting 37 — Warehouse publication: Downloaded Gold file belongs to wrong run

---

**Exact or representative message/symptom:**

Downloaded Gold file belongs to wrong run

**What it means in plain language:**

The observed application state does not match the expected context, object, data contract, permission, parameter, or verification condition.

**Most likely cause:**

A wrong path/context, missing prerequisite, version/tier difference, invalid source value, non-idempotent rerun, or unsafe assumption in Phase 15.

**What not to do:**

Do not delete, reset, overwrite, force-push, disable integrity rules, weaken a quality threshold, edit raw evidence, or expose a secret merely to remove the symptom.

**First diagnostic action:**

Compare batch ID, manifest, filename, checksum, export timestamp

### How to read the diagnostic result:

- **If it identifies the expected object/context:** Inspect the next closest dependency, parameter, data grain, or permission.
- **If it identifies a different object/context:** Stop. Correct the location before rerunning anything that changes state.
- **If the diagnostic itself fails:** Verify the tool/service is installed/running and use its official documentation entry in this workbook.

### Safest fix:

Locate/export the verified batch; do not rename an older file to match.

### Alternative fix when applicable:

Use a documented, isolated development reset or fallback only after preserving the current state and confirming that no needed work/data will be lost.

### How to verify the fix:

Repeat the original smallest verification, then rerun only the failed action. Compare actual/expected values and record the result.

### How to return to the main tutorial:

Return to Phase 15, find the exact action that produced the symptom, and complete its `Do not continue unless gate`.

[Back to the troubleshooting index](#)

## Troubleshooting 38 — SQL Server warehouse: String truncation or decimal/date conversion failure

---

### Exact or representative message/symptom:

String truncation or decimal/date conversion failure

### What it means in plain language:

The observed application state does not match the expected context, object, data contract, permission, parameter, or verification condition.

### Most likely cause:

A wrong path/context, missing prerequisite, version/tier difference, invalid source value, non-idempotent rerun, or unsafe assumption in Phase 15.

### What not to do:

Do not delete, reset, overwrite, force-push, disable integrity rules, weaken a quality threshold, edit raw evidence, or expose a secret merely to remove the symptom.

### First diagnostic action:

Load staging with raw value visibility; inspect max lengths and invalid examples

### How to read the diagnostic result:

- **If it identifies the expected object/context:** Inspect the next closest dependency, parameter, data grain, or permission.
- **If it identifies a different object/context:** Stop. Correct the location before rerunning anything that changes state.
- **If the diagnostic itself fails:** Verify the tool/service is installed/running and use its official documentation entry in this workbook.

### Safest fix:

Correct mapping/staging type or reject invalid rows; keep transaction atomic.

### Alternative fix when applicable:

Use a documented, isolated development reset or fallback only after preserving the current state and confirming that no needed work/data will be lost.

### How to verify the fix:

Repeat the original smallest verification, then rerun only the failed action. Compare actual/expected values and record the result.

### How to return to the main tutorial:

Return to Phase 15, find the exact action that produced the symptom, and complete its `Do not continue unless gate`.

[Back to the troubleshooting index](#)

## Troubleshooting 39 — Power BI connections: SQL Server certificate/encryption warning or connection failure

---

### Exact or representative message/symptom:

SQL Server certificate/encryption warning or connection failure

### What it means in plain language:

The observed application state does not match the expected context, object, data contract, permission, parameter, or verification condition.

### Most likely cause:

A wrong path/context, missing prerequisite, version/tier difference, invalid source value, non-idempotent rerun, or unsafe assumption in Phase 16.

### What not to do:

Do not delete, reset, overwrite, force-push, disable integrity rules, weaken a quality threshold, edit raw evidence, or expose a secret merely to remove the symptom.

### First diagnostic action:

Verify server/database/authentication and Microsoft connector guidance

### How to read the diagnostic result:

- **If it identifies the expected object/context:** Inspect the next closest dependency, parameter, data grain, or permission.
- **If it identifies a different object/context:** Stop. Correct the location before rerunning anything that changes state.
- **If the diagnostic itself fails:** Verify the tool/service is installed/running and use its official documentation entry in this workbook.

### Safest fix:

Use trusted local configuration or documented certificate choice; never expose credentials.

### Alternative fix when applicable:

Use a documented, isolated development reset or fallback only after preserving the current state and confirming that no needed work/data will be lost.

### How to verify the fix:

Repeat the original smallest verification, then rerun only the failed action. Compare actual/expected values and record the result.

### How to return to the main tutorial:

Return to Phase 16, find the exact action that produced the symptom, and complete its Do not continue unless gate.

[Back to the troubleshooting index](#)

## Troubleshooting 40 — Power BI relationships: Duplicate values on the one side prevent relationship

---

### Exact or representative message/symptom:

Duplicate values on the one side prevent relationship

### What it means in plain language:

The observed application state does not match the expected context, object, data contract, permission, parameter, or verification condition.

### Most likely cause:

A wrong path/context, missing prerequisite, version/tier difference, invalid source value, non-idempotent rerun, or unsafe assumption in Phase 16.

### What not to do:

Do not delete, reset, overwrite, force-push, disable integrity rules, weaken a quality threshold, edit raw evidence, or expose a secret merely to remove the symptom.

### First diagnostic action:

Profile candidate dimension key and count duplicates/nulls

### How to read the diagnostic result:

- **If it identifies the expected object/context:** Inspect the next closest dependency, parameter, data grain, or permission.
- **If it identifies a different object/context:** Stop. Correct the location before rerunning anything that changes state.
- **If the diagnostic itself fails:** Verify the tool/service is installed/running and use its official documentation entry in this workbook.

### Safest fix:

Fix the dimension key/conformance upstream; do not force many-to-many to hide bad modeling.

### Alternative fix when applicable:

Use a documented, isolated development reset or fallback only after preserving the current state and confirming that no needed work/data will be lost.

### How to verify the fix:

Repeat the original smallest verification, then rerun only the failed action. Compare actual/expected values and record the result.

### How to return to the main tutorial:

Return to Phase 16, find the exact action that produced the symptom, and complete its Do not continue unless gate.

[Back to the troubleshooting index](#)

## Troubleshooting 41 — DAX: Measure differs from SQL

---

### Exact or representative message/symptom:

Measure differs from SQL

### What it means in plain language:

The observed application state does not match the expected context, object, data contract, permission, parameter, or verification condition.

### Most likely cause:

A wrong path/context, missing prerequisite, version/tier difference, invalid source value, non-idempotent rerun, or unsafe assumption in Phase 16.

### What not to do:

Do not delete, reset, overwrite, force-push, disable integrity rules, weaken a quality threshold, edit raw evidence, or expose a secret merely to remove the symptom.

### First diagnostic action:

Match date role, filters, relationships, distinct grain, numerator/denominator and rounding

### How to read the diagnostic result:

- **If it identifies the expected object/context:** Inspect the next closest dependency, parameter, data grain, or permission.
- **If it identifies a different object/context:** Stop. Correct the location before rerunning anything that changes state.
- **If the diagnostic itself fails:** Verify the tool/service is installed/running and use its official documentation entry in this workbook.

### Safest fix:

Align semantic definition and SQL context before changing expression.

### Alternative fix when applicable:

Use a documented, isolated development reset or fallback only after preserving the current state and confirming that no needed work/data will be lost.

### How to verify the fix:

Repeat the original smallest verification, then rerun only the failed action. Compare actual/expected values and record the result.

### How to return to the main tutorial:

Return to Phase 16, find the exact action that produced the symptom, and complete its Do not continue unless gate.

[Back to the troubleshooting index](#)

## Troubleshooting 42 — Power BI report: Slicer does not affect a visual

---

### Exact or representative message/symptom:

Slicer does not affect a visual

### What it means in plain language:

The observed application state does not match the expected context, object, data contract, permission, parameter, or verification condition.

### Most likely cause:

A wrong path/context, missing prerequisite, version/tier difference, invalid source value, non-idempotent rerun, or unsafe assumption in Phase 17.

### What not to do:

Do not delete, reset, overwrite, force-push, disable integrity rules, weaken a quality threshold, edit raw evidence, or expose a secret merely to remove the symptom.

### First diagnostic action:

Use Edit interactions and inspect relationship path

### How to read the diagnostic result:

- **If it identifies the expected object/context:** Inspect the next closest dependency, parameter, data grain, or permission.
- **If it identifies a different object/context:** Stop. Correct the location before rerunning anything that changes state.
- **If the diagnostic itself fails:** Verify the tool/service is installed/running and use its official documentation entry in this workbook.

### Safest fix:

Enable intended interaction or document intentional isolation; verify no disconnected field.

### Alternative fix when applicable:

Use a documented, isolated development reset or fallback only after preserving the current state and confirming that no needed work/data will be lost.

### How to verify the fix:

Repeat the original smallest verification, then rerun only the failed action. Compare actual/expected values and record the result.

### How to return to the main tutorial:

Return to Phase 17, find the exact action that produced the symptom, and complete its Do not continue unless gate.

[Back to the troubleshooting index](#)

## Troubleshooting 43 — Power BI report: Snapshot inventory is overstated across dates

---

### Exact or representative message/symptom:

Snapshot inventory is overstated across dates

### What it means in plain language:

The observed application state does not match the expected context, object, data contract, permission, parameter, or verification condition.

### Most likely cause:

A wrong path/context, missing prerequisite, version/tier difference, invalid source value, non-idempotent rerun, or unsafe assumption in Phase 17.

### What not to do:

Do not delete, reset, overwrite, force-push, disable integrity rules, weaken a quality threshold, edit raw evidence, or expose a secret merely to remove the symptom.

### First diagnostic action:

Inspect visual axis and aggregation of snapshot balance

### How to read the diagnostic result:

- **If it identifies the expected object/context:** Inspect the next closest dependency, parameter, data grain, or permission.

- **If it identifies a different object/context:** Stop. Correct the location before rerunning anything that changes state.
- **If the diagnostic itself fails:** Verify the tool/service is installed/running and use its official documentation entry in this workbook.

**Safest fix:**

Use latest-date or period-end logic; never sum balances across snapshot dates without meaning.

**Alternative fix when applicable:**

Use a documented, isolated development reset or fallback only after preserving the current state and confirming that no needed work/data will be lost.

**How to verify the fix:**

Repeat the original smallest verification, then rerun only the failed action. Compare actual/expected values and record the result.

**How to return to the main tutorial:**

Return to Phase 17, find the exact action that produced the symptom, and complete its Do not continue unless gate.

[Back to the troubleshooting index](#)

## Troubleshooting 44 — Secrets: .env or token appears in git status/diff

---

**Exact or representative message/symptom:**

``.env or token appears in git status/diff`

**What it means in plain language:**

The observed application state does not match the expected context, object, data contract, permission, parameter, or verification condition.

**Most likely cause:**

A wrong path/context, missing prerequisite, version/tier difference, invalid source value, non-idempotent rerun, or unsafe assumption in Phase 18.

**What not to do:**

Do not delete, reset, overwrite, force-push, disable integrity rules, weaken a quality threshold, edit raw evidence, or expose a secret merely to remove the symptom.

**First diagnostic action:**

`git check-ignore -v; inspect staged diff and history`

**How to read the diagnostic result:**

- **If it identifies the expected object/context:** Inspect the next closest dependency, parameter, data grain, or permission.
- **If it identifies a different object/context:** Stop. Correct the location before rerunning anything that changes state.
- **If the diagnostic itself fails:** Verify the tool/service is installed/running and use its official documentation entry in this workbook.

**Safest fix:**

Unstage, add ignore rule, rotate exposed secret, and follow sensitive-data removal guidance if committed.

**Alternative fix when applicable:**

Use a documented, isolated development reset or fallback only after preserving the current state and confirming that no needed work/data will be lost.

**How to verify the fix:**

Repeat the original smallest verification, then rerun only the failed action. Compare actual/expected values and record the result.

**How to return to the main tutorial:**

Return to Phase 18, find the exact action that produced the symptom, and complete its Do not continue unless gate.

[Back to the troubleshooting index](#)

## Troubleshooting 45 — Cost: Databricks compute continues running

---

**Exact or representative message/symptom:**

Databricks compute continues running

**What it means in plain language:**

The observed application state does not match the expected context, object, data contract, permission, parameter, or verification condition.

**Most likely cause:**

A wrong path/context, missing prerequisite, version/tier difference, invalid source value, non-idempotent rerun, or unsafe assumption in Phase 18.

**What not to do:**

Do not delete, reset, overwrite, force-push, disable integrity rules, weaken a quality threshold, edit raw evidence, or expose a secret merely to remove the symptom.

**First diagnostic action:**

Open Compute and Job run pages; inspect active resources

**How to read the diagnostic result:**

- **If it identifies the expected object/context:** Inspect the next closest dependency, parameter, data grain, or permission.
- **If it identifies a different object/context:** Stop. Correct the location before rerunning anything that changes state.
- **If the diagnostic itself fails:** Verify the tool/service is installed/running and use its official documentation entry in this workbook.

**Safest fix:**

Stop unused compute/runs and record policy; do not assume browser close stops compute.

**Alternative fix when applicable:**

Use a documented, isolated development reset or fallback only after preserving the current state and confirming that no needed work/data will be lost.

**How to verify the fix:**

Repeat the original smallest verification, then rerun only the failed action. Compare actual/expected values and record the result.

**How to return to the main tutorial:**

Return to Phase 18, find the exact action that produced the symptom, and complete its `Do not continue unless gate`.

[Back to the troubleshooting index](#)

## Troubleshooting 46 — GitHub Actions: Workflow file is ignored or not listed

---

**Exact or representative message/symptom:**

Workflow file is ignored or not listed

**What it means in plain language:**

The observed application state does not match the expected context, object, data contract, permission, parameter, or verification condition.

**Most likely cause:**

A wrong path/context, missing prerequisite, version/tier difference, invalid source value, non-idempotent rerun, or unsafe assumption in Phase 19.

**What not to do:**

Do not delete, reset, overwrite, force-push, disable integrity rules, weaken a quality threshold, edit raw evidence, or expose a secret merely to remove the symptom.

**First diagnostic action:**

Confirm path `.github/workflows/*.yml`, branch, YAML syntax, Actions permissions

**How to read the diagnostic result:**

- **If it identifies the expected object/context:** Inspect the next closest dependency, parameter, data grain, or permission.
- **If it identifies a different object/context:** Stop. Correct the location before rerunning anything that changes state.
- **If the diagnostic itself fails:** Verify the tool/service is installed/running and use its official documentation entry in this workbook.

**Safest fix:**

Correct path/syntax and push; inspect repository Actions settings.

**Alternative fix when applicable:**

Use a documented, isolated development reset or fallback only after preserving the current state and confirming that no needed work/data will be lost.

**How to verify the fix:**

Repeat the original smallest verification, then rerun only the failed action. Compare actual/expected values and record the result.

**How to return to the main tutorial:**

Return to Phase 19, find the exact action that produced the symptom, and complete its `Do not continue unless gate`.

[Back to the troubleshooting index](#)

## Troubleshooting 47 — GitHub Actions: Tests pass locally but fail on runner

---

**Exact or representative message/symptom:**

Tests pass locally but fail on runner

**What it means in plain language:**

The observed application state does not match the expected context, object, data contract, permission, parameter, or verification condition.

**Most likely cause:**

A wrong path/context, missing prerequisite, version/tier difference, invalid source value, non-idempotent rerun, or unsafe assumption in Phase 19.

**What not to do:**

Do not delete, reset, overwrite, force-push, disable integrity rules, weaken a quality threshold, edit raw evidence, or expose a secret merely to remove the symptom.

**First diagnostic action:**

Compare Python version, OS, paths/case, dependency lock, environment assumptions

**How to read the diagnostic result:**

- **If it identifies the expected object/context:** Inspect the next closest dependency, parameter, data grain, or permission.
- **If it identifies a different object/context:** Stop. Correct the location before rerunning anything that changes state.
- **If the diagnostic itself fails:** Verify the tool/service is installed/running and use its official documentation entry in this workbook.

**Safest fix:**

Make test deterministic and infrastructure-free or explicitly configure required dependency.

**Alternative fix when applicable:**

Use a documented, isolated development reset or fallback only after preserving the current state and confirming that no needed work/data will be lost.

**How to verify the fix:**

Repeat the original smallest verification, then rerun only the failed action. Compare actual/expected values and record the result.

**How to return to the main tutorial:**

Return to Phase 19, find the exact action that produced the symptom, and complete its `Do not continue unless gate`.

[Back to the troubleshooting index](#)

## Troubleshooting 48 — Markdown: README links or anchors are broken

---

**Exact or representative message/symptom:**

README links or anchors are broken

**What it means in plain language:**

The observed application state does not match the expected context, object, data contract, permission, parameter, or verification condition.

**Most likely cause:**

A wrong path/context, missing prerequisite, version/tier difference, invalid source value, non-idempotent rerun, or unsafe assumption in Phase 20.

**What not to do:**

Do not delete, reset, overwrite, force-push, disable integrity rules, weaken a quality threshold, edit raw evidence, or expose a secret merely to remove the symptom.

**First diagnostic action:**

Run link validator; preview in VS Code and GitHub

**How to read the diagnostic result:**

- **If it identifies the expected object/context:** Inspect the next closest dependency, parameter, data grain, or permission.
- **If it identifies a different object/context:** Stop. Correct the location before rerunning anything that changes state.
- **If the diagnostic itself fails:** Verify the tool/service is installed/running and use its official documentation entry in this workbook.

**Safest fix:**

Correct relative path/anchor and preserve case; do not link to local absolute paths.

**Alternative fix when applicable:**

Use a documented, isolated development reset or fallback only after preserving the current state and confirming that no needed work/data will be lost.

**How to verify the fix:**

Repeat the original smallest verification, then rerun only the failed action. Compare actual/expected values and record the result.

**How to return to the main tutorial:**

Return to Phase 20, find the exact action that produced the symptom, and complete its Do not continue unless gate.

[Back to the troubleshooting index](#)

## Troubleshooting 49 — Portfolio: Claim has no verified evidence

---

**Exact or representative message/symptom:**

Claim has no verified evidence

**What it means in plain language:**

The observed application state does not match the expected context, object, data contract, permission, parameter, or verification condition.

**Most likely cause:**

A wrong path/context, missing prerequisite, version/tier difference, invalid source value, non-idempotent rerun, or unsafe assumption in Phase 20.

**What not to do:**

Do not delete, reset, overwrite, force-push, disable integrity rules, weaken a quality threshold, edit raw evidence, or expose a secret merely to remove the symptom.

**First diagnostic action:**

Use claim-to-evidence map and locate commit/run/query/screenshot

**How to read the diagnostic result:**

- **If it identifies the expected object/context:** Inspect the next closest dependency, parameter, data grain, or permission.
- **If it identifies a different object/context:** Stop. Correct the location before rerunning anything that changes state.
- **If the diagnostic itself fails:** Verify the tool/service is installed/running and use its official documentation entry in this workbook.

**Safest fix:**

Rewrite as planned/implemented-but-unverified or gather real evidence; never fabricate.

**Alternative fix when applicable:**

Use a documented, isolated development reset or fallback only after preserving the current state and confirming that no needed work/data will be lost.

**How to verify the fix:**

Repeat the original smallest verification, then rerun only the failed action. Compare actual/expected values and record the result.

**How to return to the main tutorial:**

Return to Phase 20, find the exact action that produced the symptom, and complete its Do not continue unless gate.

[Back to the troubleshooting index](#)

## Troubleshooting 50 — Interview: Answer sounds memorized and cannot survive follow-up

---

**Exact or representative message/symptom:**

Answer sounds memorized and cannot survive follow-up

**What it means in plain language:**

The observed application state does not match the expected context, object, data contract, permission, parameter, or verification condition.

**Most likely cause:**

A wrong path/context, missing prerequisite, version/tier difference, invalid source value, non-idempotent rerun, or unsafe assumption in Phase 21.

**What not to do:**

Do not delete, reset, overwrite, force-push, disable integrity rules, weaken a quality threshold, edit raw evidence, or expose a secret merely to remove the symptom.

**First diagnostic action:**

Trace answer to one actual file, object, test, error, and tradeoff

**How to read the diagnostic result:**

- **If it identifies the expected object/context:** Inspect the next closest dependency, parameter, data grain, or permission.
- **If it identifies a different object/context:** Stop. Correct the location before rerunning anything that changes state.
- **If the diagnostic itself fails:** Verify the tool/service is installed/running and use its official documentation entry in this workbook.

**Safest fix:**

Use requirement → decision → implementation → validation → limitation structure.

**Alternative fix when applicable:**

Use a documented, isolated development reset or fallback only after preserving the current state and confirming that no needed work/data will be lost.

**How to verify the fix:**

Repeat the original smallest verification, then rerun only the failed action. Compare actual/expected values and record the result.

**How to return to the main tutorial:**

Return to Phase 21, find the exact action that produced the symptom, and complete its Do not continue unless gate.

[Back to the troubleshooting index](#)

## Troubleshooting 51 — Optional extension: Extension breaks required path

---

**Exact or representative message/symptom:**

Extension breaks required path

**What it means in plain language:**

The observed application state does not match the expected context, object, data contract, permission, parameter, or verification condition.

**Most likely cause:**

A wrong path/context, missing prerequisite, version/tier difference, invalid source value, non-idempotent rerun, or unsafe assumption in Phase 22.

**What not to do:**

Do not delete, reset, overwrite, force-push, disable integrity rules, weaken a quality threshold, edit raw evidence, or expose a secret merely to remove the symptom.

**First diagnostic action:**

Compare branch, config, costs, dependencies, rollback plan

**How to read the diagnostic result:**

- **If it identifies the expected object/context:** Inspect the next closest dependency, parameter, data grain, or permission.
- **If it identifies a different object/context:** Stop. Correct the location before rerunning anything that changes state.
- **If the diagnostic itself fails:** Verify the tool/service is installed/running and use its official documentation entry in this workbook.

**Safest fix:**

Isolate extension on a branch/environment and retain verified batch baseline.

**Alternative fix when applicable:**

Use a documented, isolated development reset or fallback only after preserving the current state and confirming that no needed work/data will be lost.

**How to verify the fix:**

Repeat the original smallest verification, then rerun only the failed action. Compare actual/expected values and record the result.

**How to return to the main tutorial:**

Return to Phase 22, find the exact action that produced the symptom, and complete its `Do not continue unless gate`.

# Reference-code and file responsibility index

[Back to the master table of contents](#)

This index covers the actual project-file source inventory used to assemble the manual construction lessons. It excludes prior workbook exports, separate answer keys, separate journals, separate glossaries, separate troubleshooting files, separate screenshot checklists, and separate file manifests because those instructional systems are contained in this one workbook. The index is not a second deliverable and does not create any file. Your repository may differ; preserve and inspect current work before applying any instruction.

#	Path	Phase	Responsibility	Creation/ownership route	Git rule
1	docs/architecture.md	0	Markdown documentation, requirement, mapping, runbook, evidence, or guide.	Use the Phase 0 folder/file tutorial: create the parent only when needed, create the exact filename in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.
2	.gitignore	1	Repository safety/configuration file.	Use the Phase 1 folder/file tutorial: create the parent only when needed, create the exact filename in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.
3	config/logging.yml	1	YAML configuration for generation, logging, Databricks Jobs, or GitHub Actions.	Use the Phase 1 folder/file tutorial: create the parent only when needed, create the exact filename in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.
4	databricks/notebooks/11_publish_gold.py	1	Python module, script, Databricks source notebook, or automated test.	Use the Phase 1 folder/file tutorial: create the parent only when needed, create the exact filename in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.
5	databricks/notebooks/12_demo_queries.py	1	Python module, script, Databricks source notebook, or automated test.	Use the Phase 1 folder/file tutorial: create the parent only when needed, create the exact filename in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.
6	datasets/raw/files/.gitkeep	1	Placeholder that allows Git to retain an otherwise empty directory; remove only when a real tracked file makes it unnecessary.	Create only when the folder must exist before a real tracked file; verify with Git status and remove after a meaningful tracked child exists.	Ignore generated raw/log/local-secret artifacts; track reviewed source, tests, docs, workflow, and small fictional fixtures.

#	Path	Phase	Responsibility	Creation/ownership route	Git rule
7	datasets/raw/postgres/.gitkeep	1	Placeholder that allows Git to retain an otherwise empty directory; remove only when a real tracked file makes it unnecessary.	Create only when the folder must exist before a real tracked file; verify with Git status and remove after a meaningful tracked child exists.	Ignore generated raw/log/local-secret artifacts; track reviewed source, tests, docs, workflow, and small fictional fixtures.
8	datasets/raw/sqlserver/.gitkeep	1	Placeholder that allows Git to retain an otherwise empty directory; remove only when a real tracked file makes it unnecessary.	Create only when the folder must exist before a real tracked file; verify with Git status and remove after a meaningful tracked child exists.	Ignore generated raw/log/local-secret artifacts; track reviewed source, tests, docs, workflow, and small fictional fixtures.
9	docs/images/cloud_connected_flow.dot	1	Architecture or lineage diagram source/render used for documentation evidence; create from verified architecture text and never fabricate execution results.	Use the Phase 1 folder/file tutorial: create the parent only when needed, create the exact filename in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.
10	docs/images/cloud_connected_flow.mmd	1	Architecture or lineage diagram source/render used for documentation evidence; create from verified architecture text and never fabricate execution results.	Use the Phase 1 folder/file tutorial: create the parent only when needed, create the exact filename in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.
11	docs/images/cloud_connected_flow.svg	1	Architecture or lineage diagram source/render used for documentation evidence; create from verified architecture text and never fabricate execution results.	Generated/exported by the phase tool or preserved from existing work; do not manually type generated bytes. Verify generator/export source, path, size, and content.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.
12	docs/images/gold_star_schema.dot	1	Architecture or lineage diagram source/render used for documentation evidence; create from verified architecture text and never fabricate execution results.	Use the Phase 1 folder/file tutorial: create the parent only when needed, create the exact filename in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.
13	docs/images/gold_star_schema.mmd	1	Architecture or lineage diagram source/render used for documentation evidence; create from verified architecture text and never fabricate execution results.	Use the Phase 1 folder/file tutorial: create the parent only when needed, create the exact filename in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.
14	docs/images/gold_star_schema.svg	1	Architecture or lineage diagram source/render used for documentation evidence; create from verified architecture text and never fabricate execution results.	Generated/exported by the phase tool or preserved from existing work; do not manually type generated bytes. Verify generator/export source, path, size, and content.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.

Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.
30	docs/repository_current_state.md	1	Markdown documentation, requirement, mapping, runbook, evidence, or guide.	Use the Phase 1 folder/file tutorial: create the parent only when needed, create the exact filename in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.
31	docs/repository_migration_plan.md	1	Markdown documentation, requirement, mapping, runbook, evidence, or guide.	Use the Phase 1 folder/file tutorial: create the parent only when needed, create the exact filename in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.
32	docs/testing_strategy.md	1	Markdown documentation, requirement, mapping, runbook, evidence, or guide.	Use the Phase 1 folder/file tutorial: create the parent only when needed, create the exact filename in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.
33	LICENSE	1	Project configuration, documentation, source, fixture, or support asset.	Use the Phase 1 folder/file tutorial: create the parent only when needed, create the exact filename in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.
34	logs/.gitkeep	1	Placeholder that allows Git to retain an otherwise empty directory; remove only when a real tracked file makes it unnecessary.	Create only when the folder must exist before a real tracked file; verify with Git status and remove after a meaningful tracked child exists.	Ignore generated raw/log/local-secret artifacts; track reviewed source, tests, docs, workflow, and small fictional fixtures.
35	Makefile-or-PowerShell-Commands.md	1	Markdown documentation, requirement, mapping, runbook, evidence, or guide.	Use the Phase 1 folder/file tutorial: create the parent only when needed, create the exact filename in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.

#	Path	Phase	Responsibility	Creation/ownership route	Git rule
36	README.md	1	Markdown documentation, requirement, mapping, runbook, evidence, or guide.	Use the Phase 1 folder/file tutorial: create the parent only when needed, create the exact filename in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.
37	run_artifacts/.gitkeep	1	Placeholder that allows Git to retain an otherwise empty directory; remove only when a real tracked file makes it unnecessary.	Create only when the folder must exist before a real tracked file; verify with Git status and remove after a meaningful tracked child exists.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.
38	scripts/__init__.py	1	Python module, script, Databricks source notebook, or automated test.	Use the Phase 1 folder/file tutorial: create the parent only when needed, create the exact filename in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.
39	scripts/loading/__init__.py	1	Python module, script, Databricks source notebook, or automated test.	Use the Phase 1 folder/file tutorial: create the parent only when needed, create the exact filename in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.
40	scripts/setup/__init__.py	1	Python module, script, Databricks source notebook, or automated test.	Use the Phase 1 folder/file tutorial: create the parent only when needed, create the exact filename in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.
41	scripts/setup/create_project_folders.ps1	1	Project configuration, documentation, source, fixture, or support asset.	Use the Phase 1 folder/file tutorial: create the parent only when needed, create the exact filename in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.
42	scripts/utilities/__init__.py	1	Python module, script, Databricks source notebook, or automated test.	Use the Phase 1 folder/file tutorial: create the parent only when needed, create the exact filename in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.

50	docs/assumption_log.md	3	Markdown documentation, requirement, mapping, runbook, evidence, or guide.	Use the Phase 3 folder/file tutorial: create the parent only when needed, create the exact filename in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.
51	docs/business_requirements.md	3	Markdown documentation, requirement, mapping, runbook, evidence, or guide.	Use the Phase 3 folder/file tutorial: create the parent only when needed, create the exact filename in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.
52	docs/risk_register.md	3	Markdown documentation, requirement, mapping, runbook, evidence, or guide.	Use the Phase 3 folder/file tutorial: create the parent only when needed, create the exact filename in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.
53	docs/data_dictionary.csv	4	Structured mapping, definition, metadata, or small fictional data fixture.	Build rows in VS Code or a spreadsheet-like editor while preserving UTF-8 CSV structure; validate headers, row counts, duplicates, and Git diff.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.
54	docs/data_dictionary.md	4	Markdown documentation, requirement, mapping, runbook, evidence, or guide.	Use the Phase 4 folder/file tutorial: create the parent only when needed, create the exact filename in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.
55	docs/source_to_target_mapping.csv	4	Structured mapping, definition, metadata, or small fictional data fixture.	Build rows in VS Code or a spreadsheet-like editor while preserving UTF-8 CSV structure; validate headers, row counts, duplicates, and Git diff.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.
56	docs/source_to_target_mapping.md	4	Markdown documentation, requirement, mapping, runbook, evidence, or guide.	Use the Phase 4 folder/file tutorial: create the parent only when needed, create the exact filename in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.

#	Path	Phase	Responsibility	Creation/ownership route	Git rule
57	sql/postgres/source/00_create_database.sql	4	SQL definition, transformation pattern, validation query, or analyst query for the named dialect/location.	Use the Phase 4 folder/file tutorial: create the parent only when needed, create the exact filename in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.
58	sql/postgres/source/01_create_digital_schema.sql	4	SQL definition, transformation pattern, validation query, or analyst query for the named dialect/location.	Use the Phase 4 folder/file tutorial: create the parent only when needed, create the exact filename in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.
59	sql/postgres/source/90_development_reset.sql	4	SQL definition, transformation pattern, validation query, or analyst query for the named dialect/location.	Use the Phase 4 folder/file tutorial: create the parent only when needed, create the exact filename in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.
60	sql/sqlserver/source/01_create_erp_database.sql	4	SQL definition, transformation pattern, validation query, or analyst query for the named dialect/location.	Use the Phase 4 folder/file tutorial: create the parent only when needed, create the exact filename in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.
61	sql/sqlserver/source/02_create_erp_tables.sql	4	SQL definition, transformation pattern, validation query, or analyst query for the named dialect/location.	Use the Phase 4 folder/file tutorial: create the parent only when needed, create the exact filename in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.
62	sql/sqlserver/source/90_development_reset.sql	4	SQL definition, transformation pattern, validation query, or analyst query for the named dialect/location.	Use the Phase 4 folder/file tutorial: create the parent only when needed, create the exact filename in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.
63	config/data_generation.yml	5	YAML configuration for generation, logging, Databricks Jobs, or GitHub Actions.	Use the Phase 5 folder/file tutorial: create the parent only when needed, create the exact filename in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.

Generated/exported by the phase tool or preserved from existing work; do not manually type generated bytes. Verify generator/export source, path, size, and content.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.
88	datasets/sample/sqlserver/shipments.csv	5	Small fictional sample fixture used by tests and examples; generated/maintained separately from full raw batches.	Generated/exported by the phase tool or preserved from existing work; do not manually type generated bytes. Verify generator/export source, path, size, and content.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.
89	datasets/sample/sqlserver/stores.csv	5	Small fictional sample fixture used by tests and examples; generated/maintained separately from full raw batches.	Generated/exported by the phase tool or preserved from existing work; do not manually type generated bytes. Verify generator/export source, path, size, and content.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.
90	datasets/sample/sqlserver/suppliers.csv	5	Small fictional sample fixture used by tests and examples; generated/maintained separately from full raw batches.	Generated/exported by the phase tool or preserved from existing work; do not manually type generated bytes. Verify generator/export source, path, size, and content.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.

#	Path	Phase	Responsibility	Creation/ownership route	Git rule
91	scripts/data_generation/__init__.py	5	Python module, script, Databricks source notebook, or automated test.	Use the Phase 5 folder/file tutorial: create the parent only when needed, create the exact filename in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.
92	scripts/data_generation/generate_northstar_data.py	5	Python module, script, Databricks source notebook, or automated test.	Use the Phase 5 folder/file tutorial: create the parent only when needed, create the exact filename in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.
93	scripts/data_generation/README.md	5	Markdown documentation, requirement, mapping, runbook, evidence, or guide.	Use the Phase 5 folder/file tutorial: create the parent only when needed, create the exact filename in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.
94	scripts/validation/validate_generated_data.py	5	Python module, script, Databricks source notebook, or automated test.	Use the Phase 5 folder/file tutorial: create the parent only when needed, create the exact filename in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.
95	tests/unit/test_generator.py	5	Python module, script, Databricks source notebook, or automated test.	Use the Phase 5 folder/file tutorial: create the parent only when needed, create the exact filename in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.
96	.env.example	6	Repository safety/configuration file.	Use the Phase 6 folder/file tutorial: create the parent only when needed, create the exact filename in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.	Ignore generated raw/log/local-secret artifacts; track reviewed source, tests, docs, workflow, and small fictional fixtures.
97	scripts/loading/load_postgres_source.py	6	Python module, script, Databricks source notebook, or automated test.	Use the Phase 6 folder/file tutorial: create the parent only when needed, create the exact filename in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.

#	Path	Phase	Responsibility	Creation/ownership route	Git rule
98	scripts/loading/load_sqlserv-er_source.py	6	Python module, script, Databricks source notebook, or automated test.	Use the Phase 6 folder/file tutorial: create the parent only when needed, create the exact filename in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.
99	sql/postgres/validation/01_validate_digital_source.sql	6	SQL definition, transformation pattern, validation query, or analyst query for the named dialect/location.	Use the Phase 6 folder/file tutorial: create the parent only when needed, create the exact filename in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.
100	sql/sqlserver/validation/01_validate_erp_source.sql	6	SQL definition, transformation pattern, validation query, or analyst query for the named dialect/location.	Use the Phase 6 folder/file tutorial: create the parent only when needed, create the exact filename in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.
101	scripts/extraction/__init__.py	7	Python module, script, Databricks source notebook, or automated test.	Use the Phase 7 folder/file tutorial: create the parent only when needed, create the exact filename in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.
102	scripts/extraction/extract_local_sources.py	7	Python module, script, Databricks source notebook, or automated test.	Use the Phase 7 folder/file tutorial: create the parent only when needed, create the exact filename in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.
103	scripts/utilities/checksums.py	7	Python module, script, Databricks source notebook, or automated test.	Use the Phase 7 folder/file tutorial: create the parent only when needed, create the exact filename in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.
104	scripts/utilities/database.py	7	Python module, script, Databricks source notebook, or automated test.	Use the Phase 7 folder/file tutorial: create the parent only when needed, create the exact filename in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.

#	Path	Phase	Responsibility	Creation/ownership route	Git rule
105	databricks/notebooks/00_environment_check.py	8	Python module, script, Databricks source notebook, or automated test.	Use the Phase 8 folder/file tutorial: create the parent only when needed, create the exact filename in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.
106	databricks/README.md	8	Markdown documentation, requirement, mapping, runbook, evidence, or guide.	Use the Phase 8 folder/file tutorial: create the parent only when needed, create the exact filename in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.
107	databricks/notebooks/01_bronze_sqlserver.py	9	Python module, script, Databricks source notebook, or automated test.	Use the Phase 9 folder/file tutorial: create the parent only when needed, create the exact filename in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.
108	databricks/notebooks/02_bronze_postgres.py	9	Python module, script, Databricks source notebook, or automated test.	Use the Phase 9 folder/file tutorial: create the parent only when needed, create the exact filename in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.
109	databricks/notebooks/03_bronze_files.py	9	Python module, script, Databricks source notebook, or automated test.	Use the Phase 9 folder/file tutorial: create the parent only when needed, create the exact filename in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.
110	sql/databricks/bronze/01_bronze_audit_pattern.sql	9	SQL definition, transformation pattern, validation query, or analyst query for the named dialect/location.	Use the Phase 9 folder/file tutorial: create the parent only when needed, create the exact filename in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.
111	databricks/notebooks/04_silver_customers.py	10	Python module, script, Databricks source notebook, or automated test.	Use the Phase 10 folder/file tutorial: create the parent only when needed, create the exact filename in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.

#	Path	Phase	Responsibility	Creation/ownership route	Git rule
112	databricks/notebooks/05_silver_products.py	10	Python module, script, Databricks source notebook, or automated test.	Use the Phase 10 folder/file tutorial: create the parent only when needed, create the exact filename in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.
113	databricks/notebooks/06_silver_sales.py	10	Python module, script, Databricks source notebook, or automated test.	Use the Phase 10 folder/file tutorial: create the parent only when needed, create the exact filename in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.
114	databricks/notebooks/07_silver_digital.py	10	Python module, script, Databricks source notebook, or automated test.	Use the Phase 10 folder/file tutorial: create the parent only when needed, create the exact filename in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.
115	sql/databricks/silver/01_customer_quality_patterns.sql	10	SQL definition, transformation pattern, validation query, or analyst query for the named dialect/location.	Use the Phase 10 folder/file tutorial: create the parent only when needed, create the exact filename in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.
116	sql/databricks/silver/02_sales_quality_patterns.sql	10	SQL definition, transformation pattern, validation query, or analyst query for the named dialect/location.	Use the Phase 10 folder/file tutorial: create the parent only when needed, create the exact filename in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.
117	databricks/notebooks/08_gold_dimensions.py	11	Python module, script, Databricks source notebook, or automated test.	Use the Phase 11 folder/file tutorial: create the parent only when needed, create the exact filename in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.
118	docs/images/scd2_timeline.dot	11	Architecture or lineage diagram source/render used for documentation evidence; create from verified architecture text and never fabricate execution results.	Use the Phase 11 folder/file tutorial: create the parent only when needed, create the exact filename in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.

#	Path	Phase	Responsibility	Creation/ownership route	Git rule
119	docs/images/ scd2_timeline.mmd	11	Architecture or lineage diagram source/render used for documentation evidence; create from verified architecture text and never fabricate execution results.	Use the Phase 11 folder/file tutorial: create the parent only when needed, create the exact filename in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.
120	docs/images/ scd2_timeline.svg	11	Architecture or lineage diagram source/render used for documentation evidence; create from verified architecture text and never fabricate execution results.	Generated/exported by the phase tool or preserved from existing work; do not manually type generated bytes. Verify generator/export source, path, size, and content.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.
121	sql/databricks/gold/ 01_scd2_merge_pattern.sql	11	SQL definition, transformation pattern, validation query, or analyst query for the named dialect/location.	Use the Phase 11 folder/file tutorial: create the parent only when needed, create the exact filename in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.
122	databricks/notebooks/ 09_gold_facts.py	12	Python module, script, Databricks source notebook, or automated test.	Use the Phase 12 folder/file tutorial: create the parent only when needed, create the exact filename in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.
123	sql/databricks/gold/ 02_kpi_views.sql	12	SQL definition, transformation pattern, validation query, or analyst query for the named dialect/location.	Use the Phase 12 folder/file tutorial: create the parent only when needed, create the exact filename in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.
124	databricks/notebooks/ 10_data_quality.py	13	Python module, script, Databricks source notebook, or automated test.	Use the Phase 13 folder/file tutorial: create the parent only when needed, create the exact filename in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.
125	datasets/expected_quality_issues/.gitkeep	13	Placeholder that allows Git to retain an otherwise empty directory; remove only when a real tracked file makes it unnecessary.	Create only when the folder must exist before a real tracked file; verify with Git status and remove after a meaningful tracked child exists.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.

#	Path	Phase	Responsibility	Creation/ownership route	Git rule
126	sql/databricks/quality/01_quality_gate.sql	13	SQL definition, transformation pattern, validation query, or analyst query for the named dialect/location.	Use the Phase 13 folder/file tutorial: create the parent only when needed, create the exact filename in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.
127	tests/data_quality/test_sample_quality_fixture.py	13	Python module, script, Databricks source notebook, or automated test.	Use the Phase 13 folder/file tutorial: create the parent only when needed, create the exact filename in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.
128	tests/reconciliation/.gitkeep	13	Placeholder that allows Git to retain an otherwise empty directory; remove only when a real tracked file makes it unnecessary.	Create only when the folder must exist before a real tracked file; verify with Git status and remove after a meaningful tracked child exists.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.
129	tests/reconciliation/test_sample_reconciliation.py	13	Python module, script, Databricks source notebook, or automated test.	Use the Phase 13 folder/file tutorial: create the parent only when needed, create the exact filename in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.
130	databricks/jobs/job_definition.example.yml	14	YAML configuration for generation, logging, Databricks Jobs, or GitHub Actions.	Use the Phase 14 folder/file tutorial: create the parent only when needed, create the exact filename in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.
131	databricks/jobs/job_task_map.md	14	Markdown documentation, requirement, mapping, runbook, evidence, or guide.	Use the Phase 14 folder/file tutorial: create the parent only when needed, create the exact filename in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.
132	docs/images/jobs_dependency.dot	14	Architecture or lineage diagram source/render used for documentation evidence; create from verified architecture text and never fabricate execution results.	Use the Phase 14 folder/file tutorial: create the parent only when needed, create the exact filename in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.

#	Path	Phase	Responsibility	Creation/ownership route	Git rule
133	docs/images/jobs_dependency.mmd	14	Architecture or lineage diagram source/render used for documentation evidence; create from verified architecture text and never fabricate execution results.	Use the Phase 14 folder/file tutorial: create the parent only when needed, create the exact filename in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.
134	docs/images/jobs_dependency.svg	14	Architecture or lineage diagram source/render used for documentation evidence; create from verified architecture text and never fabricate execution results.	Generated/exported by the phase tool or preserved from existing work; do not manually type generated bytes. Verify generator/export source, path, size, and content.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.
135	scripts/loading/load_gold_to_sqlserver.py	15	Python module, script, Databricks source notebook, or automated test.	Use the Phase 15 folder/file tutorial: create the parent only when needed, create the exact filename in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.
136	sql/sqlserver/validation/02_validate_warehouse.sql	15	SQL definition, transformation pattern, validation query, or analyst query for the named dialect/location.	Use the Phase 15 folder/file tutorial: create the parent only when needed, create the exact filename in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.
137	sql/sqlserver/warehouse/01_create_warehouse.sql	15	SQL definition, transformation pattern, validation query, or analyst query for the named dialect/location.	Use the Phase 15 folder/file tutorial: create the parent only when needed, create the exact filename in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.
138	sql/sqlserver/warehouse/02_create_staging_tables.sql	15	SQL definition, transformation pattern, validation query, or analyst query for the named dialect/location.	Use the Phase 15 folder/file tutorial: create the parent only when needed, create the exact filename in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.
139	sql/sqlserver/warehouse/03_semantic_views.sql	15	SQL definition, transformation pattern, validation query, or analyst query for the named dialect/location.	Use the Phase 15 folder/file tutorial: create the parent only when needed, create the exact filename in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.

#	Path	Phase	Responsibility	Creation/ownership route	Git rule
140	docs/kpi_definitions.csv	16	Structured mapping, definition, metadata, or small fictional data fixture.	Build rows in VS Code or a spreadsheet-like editor while preserving UTF-8 CSV structure; validate headers, row counts, duplicates, and Git diff.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.
141	docs/kpi_definitions.md	16	Markdown documentation, requirement, mapping, runbook, evidence, or guide.	Use the Phase 16 folder/file tutorial: create the parent only when needed, create the exact filename in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.
142	powerbi/measures.dax	16	Power BI DAX measure definitions.	Use the Phase 16 folder/file tutorial: create the parent only when needed, create the exact filename in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.
143	powerbi/semantic_model.md	16	Markdown documentation, requirement, mapping, runbook, evidence, or guide.	Use the Phase 16 folder/file tutorial: create the parent only when needed, create the exact filename in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.
144	powerbi/dashboard_requirements.md	17	Markdown documentation, requirement, mapping, runbook, evidence, or guide.	Use the Phase 17 folder/file tutorial: create the parent only when needed, create the exact filename in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.
145	powerbi/README.md	17	Markdown documentation, requirement, mapping, runbook, evidence, or guide.	Use the Phase 17 folder/file tutorial: create the parent only when needed, create the exact filename in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.
146	sql/sqlserver/analytics/20_analyst_questions.sql	17	SQL definition, transformation pattern, validation query, or analyst query for the named dialect/location.	Use the Phase 17 folder/file tutorial: create the parent only when needed, create the exact filename in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.

Use the Phase 19 folder/file tutorial: create the parent only when needed, create the exact filename in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.

#	Path	Phase	Responsibility	Creation/ownership route	Git rule
161	datasets/README.md	20	Markdown documentation, requirement, mapping, runbook, evidence, or guide.	Use the Phase 20 folder/file tutorial: create the parent only when needed, create the exact filename in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.
162	docs/claim_to_evidence_map.md	20	Markdown documentation, requirement, mapping, runbook, evidence, or guide.	Use the Phase 20 folder/file tutorial: create the parent only when needed, create the exact filename in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.
163	docs/demo_video_script.md	20	Markdown documentation, requirement, mapping, runbook, evidence, or guide.	Use the Phase 20 folder/file tutorial: create the parent only when needed, create the exact filename in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.
164	docs/images/README.md	20	Markdown documentation, requirement, mapping, runbook, evidence, or guide.	Use the Phase 20 folder/file tutorial: create the parent only when needed, create the exact filename in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.
165	docs/images/screenshots/.gitkeep	20	Placeholder that allows Git to retain an otherwise empty directory; remove only when a real tracked file makes it unnecessary.	Create only when the folder must exist before a real tracked file; verify with Git status and remove after a meaningful tracked child exists.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.
166	docs/linkedin_post.md	20	Markdown documentation, requirement, mapping, runbook, evidence, or guide.	Use the Phase 20 folder/file tutorial: create the parent only when needed, create the exact filename in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.
167	docs/repository_baseline/README.original.md	20	Markdown documentation, requirement, mapping, runbook, evidence, or guide.	Use the Phase 20 folder/file tutorial: create the parent only when needed, create the exact filename in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.

#	Path	Phase	Responsibility	Creation/ownership route	Git rule
168	docs/re-sume_bullets.md	20	Markdown documentation, requirement, mapping, runbook, evidence, or guide.	Use the Phase 20 folder/file tutorial: create the parent only when needed, create the exact filename in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.
169	docs/data_lineage.md	21	Markdown documentation, requirement, mapping, runbook, evidence, or guide.	Use the Phase 21 folder/file tutorial: create the parent only when needed, create the exact filename in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.
170	docs/interview_walkthrough.md	21	Markdown documentation, requirement, mapping, runbook, evidence, or guide.	Use the Phase 21 folder/file tutorial: create the parent only when needed, create the exact filename in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.
171	docs/optional_extensions.md	22	Markdown documentation, requirement, mapping, runbook, evidence, or guide.	Use the Phase 22 folder/file tutorial: create the parent only when needed, create the exact filename in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.
172	docs/runbook.md	22	Markdown documentation, requirement, mapping, runbook, evidence, or guide.	Use the Phase 22 folder/file tutorial: create the parent only when needed, create the exact filename in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.	Track when the file is reviewed, non-secret, and intentionally part of the reproducible project.

## File responsibility 1 — docs/architecture.md

**Phase introduced:** Phase 0.

**Parent folder:** docs.

**Extension/type:** .md.

**Purpose:** Markdown documentation, requirement, mapping, runbook, evidence, or guide.

**Creation/ownership route:** Use the Phase 0 folder/file tutorial: create the parent only when needed, create the exact filename in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.

**Dependencies:** Follow the phase order and do not create this path before its first real input exists.

**Verification:** Confirm exact path, extension, expected producer/editor, content shape, non-secret status, and Git behavior. For generated content, compare manifest/checksum or export source rather than hand-editing it.

**If missing:** The related test, transformation, documentation, job, report, or reproducibility claim is incomplete; investigate the producer and phase gate rather than inventing an empty placeholder.

**If already present:** Preserve and inspect it. Compare current Git history and contents with the workbook before replacing

anything.

**Detailed route:** Detailed file introduction and optional reference answer appear in Phase 0, Lesson 0.3.

[Back to the file responsibility index](#)

## File responsibility 2 — .gitignore

---

**Phase introduced:** Phase 1.

**Parent folder:** ..

**Extension/type:** (no extension).

**Purpose:** Repository safety/configuration file.

**Creation/ownership route:** Use the Phase 1 folder/file tutorial: create the parent only when needed, create the exact file-name in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.

**Dependencies:** Follow the phase order and do not create this path before its first real input exists.

**Verification:** Confirm exact path, extension, expected producer/editor, content shape, non-secret status, and Git behavior. For generated content, compare manifest/checksum or export source rather than hand-editing it.

**If missing:** The related test, transformation, documentation, job, report, or reproducibility claim is incomplete; investigate the producer and phase gate rather than inventing an empty placeholder.

**If already present:** Preserve and inspect it. Compare current Git history and contents with the workbook before replacing anything.

**Detailed route:** Detailed file introduction and optional reference answer appear in Phase 1, Lesson 1.3.

[Back to the file responsibility index](#)

## File responsibility 3 — config/logging.yml

---

**Phase introduced:** Phase 1.

**Parent folder:** config.

**Extension/type:** .yml.

**Purpose:** YAML configuration for generation, logging, Databricks Jobs, or GitHub Actions.

**Creation/ownership route:** Use the Phase 1 folder/file tutorial: create the parent only when needed, create the exact file-name in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.

**Dependencies:** Follow the phase order and do not create this path before its first real input exists.

**Verification:** Confirm exact path, extension, expected producer/editor, content shape, non-secret status, and Git behavior. For generated content, compare manifest/checksum or export source rather than hand-editing it.

**If missing:** The related test, transformation, documentation, job, report, or reproducibility claim is incomplete; investigate the producer and phase gate rather than inventing an empty placeholder.

**If already present:** Preserve and inspect it. Compare current Git history and contents with the workbook before replacing anything.

**Detailed route:** This responsibility card is the construction record for a support/generated file not treated as a core hand-written source file.

[Back to the file responsibility index](#)

## File responsibility 4 — databricks/notebooks/11\_publish\_gold.py

---

**Phase introduced:** Phase 1.

**Parent folder:** databricks/notebooks.

**Extension/type:** .py.

**Purpose:** Python module, script, Databricks source notebook, or automated test.

**Creation/ownership route:** Use the Phase 1 folder/file tutorial: create the parent only when needed, create the exact file-name in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.

**Dependencies:** Follow the phase order and do not create this path before its first real input exists.

**Verification:** Confirm exact path, extension, expected producer/editor, content shape, non-secret status, and Git behavior. For generated content, compare manifest/checksum or export source rather than hand-editing it.

**If missing:** The related test, transformation, documentation, job, report, or reproducibility claim is incomplete; investigate the producer and phase gate rather than inventing an empty placeholder.

**If already present:** Preserve and inspect it. Compare current Git history and contents with the workbook before replacing

anything.

**Detailed route:** This responsibility card is the construction record for a support/generated file not treated as a core hand-written source file.

[Back to the file responsibility index](#)

## File responsibility 5 — databricks/notebooks/12\_demo\_queries.py

---

**Phase introduced:** Phase 1.

**Parent folder:** databricks/notebooks.

**Extension/type:** .py.

**Purpose:** Python module, script, Databricks source notebook, or automated test.

**Creation/ownership route:** Use the Phase 1 folder/file tutorial: create the parent only when needed, create the exact file-name in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.

**Dependencies:** Follow the phase order and do not create this path before its first real input exists.

**Verification:** Confirm exact path, extension, expected producer/editor, content shape, non-secret status, and Git behavior. For generated content, compare manifest/checksum or export source rather than hand-editing it.

**If missing:** The related test, transformation, documentation, job, report, or reproducibility claim is incomplete; investigate the producer and phase gate rather than inventing an empty placeholder.

**If already present:** Preserve and inspect it. Compare current Git history and contents with the workbook before replacing anything.

**Detailed route:** This responsibility card is the construction record for a support/generated file not treated as a core hand-written source file.

[Back to the file responsibility index](#)

## File responsibility 6 — datasets/raw/files/.gitkeep

---

**Phase introduced:** Phase 1.

**Parent folder:** datasets/raw/files.

**Extension/type:** (no extension).

**Purpose:** Placeholder that allows Git to retain an otherwise empty directory; remove only when a real tracked file makes it unnecessary.

**Creation/ownership route:** Create only when the folder must exist before a real tracked file; verify with Git status and remove after a meaningful tracked child exists.

**Dependencies:** Follow the phase order and do not create this path before its first real input exists.

**Verification:** Confirm exact path, extension, expected producer/editor, content shape, non-secret status, and Git behavior. For generated content, compare manifest/checksum or export source rather than hand-editing it.

**If missing:** The related test, transformation, documentation, job, report, or reproducibility claim is incomplete; investigate the producer and phase gate rather than inventing an empty placeholder.

**If already present:** Preserve and inspect it. Compare current Git history and contents with the workbook before replacing anything.

**Detailed route:** This responsibility card is the construction record for a support/generated file not treated as a core hand-written source file.

[Back to the file responsibility index](#)

## File responsibility 7 — datasets/raw/postgres/.gitkeep

---

**Phase introduced:** Phase 1.

**Parent folder:** datasets/raw/postgres.

**Extension/type:** (no extension).

**Purpose:** Placeholder that allows Git to retain an otherwise empty directory; remove only when a real tracked file makes it unnecessary.

**Creation/ownership route:** Create only when the folder must exist before a real tracked file; verify with Git status and remove after a meaningful tracked child exists.

**Dependencies:** Follow the phase order and do not create this path before its first real input exists.

**Verification:** Confirm exact path, extension, expected producer/editor, content shape, non-secret status, and Git behavior. For generated content, compare manifest/checksum or export source rather than hand-editing it.

**If missing:** The related test, transformation, documentation, job, report, or reproducibility claim is incomplete; investigate

the producer and phase gate rather than inventing an empty placeholder.

**If already present:** Preserve and inspect it. Compare current Git history and contents with the workbook before replacing anything.

**Detailed route:** This responsibility card is the construction record for a support/generated file not treated as a core hand-written source file.

[Back to the file responsibility index](#)

## File responsibility 8 — datasets/raw/sqlserver/.gitkeep

---

**Phase introduced:** Phase 1.

**Parent folder:** datasets/raw/sqlserver.

**Extension/type:** (no extension).

**Purpose:** Placeholder that allows Git to retain an otherwise empty directory; remove only when a real tracked file makes it unnecessary.

**Creation/ownership route:** Create only when the folder must exist before a real tracked file; verify with Git status and remove after a meaningful tracked child exists.

**Dependencies:** Follow the phase order and do not create this path before its first real input exists.

**Verification:** Confirm exact path, extension, expected producer/editor, content shape, non-secret status, and Git behavior. For generated content, compare manifest/checksum or export source rather than hand-editing it.

**If missing:** The related test, transformation, documentation, job, report, or reproducibility claim is incomplete; investigate the producer and phase gate rather than inventing an empty placeholder.

**If already present:** Preserve and inspect it. Compare current Git history and contents with the workbook before replacing anything.

**Detailed route:** This responsibility card is the construction record for a support/generated file not treated as a core hand-written source file.

[Back to the file responsibility index](#)

## File responsibility 9 — docs/images/cloud\_connected\_flow.dot

---

**Phase introduced:** Phase 1.

**Parent folder:** docs/images.

**Extension/type:** .dot.

**Purpose:** Architecture or lineage diagram source/render used for documentation evidence; create from verified architecture text and never fabricate execution results.

**Creation/ownership route:** Use the Phase 1 folder/file tutorial: create the parent only when needed, create the exact file-name in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.

**Dependencies:** Follow the phase order and do not create this path before its first real input exists.

**Verification:** Confirm exact path, extension, expected producer/editor, content shape, non-secret status, and Git behavior. For generated content, compare manifest/checksum or export source rather than hand-editing it.

**If missing:** The related test, transformation, documentation, job, report, or reproducibility claim is incomplete; investigate the producer and phase gate rather than inventing an empty placeholder.

**If already present:** Preserve and inspect it. Compare current Git history and contents with the workbook before replacing anything.

**Detailed route:** This responsibility card is the construction record for a support/generated file not treated as a core hand-written source file.

[Back to the file responsibility index](#)

## File responsibility 10 — docs/images/cloud\_connected\_flow.mmd

---

**Phase introduced:** Phase 1.

**Parent folder:** docs/images.

**Extension/type:** .mmd.

**Purpose:** Architecture or lineage diagram source/render used for documentation evidence; create from verified architecture text and never fabricate execution results.

**Creation/ownership route:** Use the Phase 1 folder/file tutorial: create the parent only when needed, create the exact file-name in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.

**Dependencies:** Follow the phase order and do not create this path before its first real input exists.

**Verification:** Confirm exact path, extension, expected producer/editor, content shape, non-secret status, and Git behavior. For generated content, compare manifest/checksum or export source rather than hand-editing it.

**If missing:** The related test, transformation, documentation, job, report, or reproducibility claim is incomplete; investigate the producer and phase gate rather than inventing an empty placeholder.

**If already present:** Preserve and inspect it. Compare current Git history and contents with the workbook before replacing anything.

**Detailed route:** This responsibility card is the construction record for a support/generated file not treated as a core hand-written source file.

[Back to the file responsibility index](#)

## File responsibility 11 — docs/images/cloud\_connected\_flow.svg

---

**Phase introduced:** Phase 1.

**Parent folder:** docs/images.

**Extension/type:** .svg.

**Purpose:** Architecture or lineage diagram source/render used for documentation evidence; create from verified architecture text and never fabricate execution results.

**Creation/ownership route:** Generated/exported by the phase tool or preserved from existing work; do not manually type generated bytes. Verify generator/export source, path, size, and content.

**Dependencies:** Follow the phase order and do not create this path before its first real input exists.

**Verification:** Confirm exact path, extension, expected producer/editor, content shape, non-secret status, and Git behavior. For generated content, compare manifest/checksum or export source rather than hand-editing it.

**If missing:** The related test, transformation, documentation, job, report, or reproducibility claim is incomplete; investigate the producer and phase gate rather than inventing an empty placeholder.

**If already present:** Preserve and inspect it. Compare current Git history and contents with the workbook before replacing anything.

**Detailed route:** This responsibility card is the construction record for a support/generated file not treated as a core hand-written source file.

---

**Phase introduced:** Phase 1.

**Parent folder:** docs/images.

**Extension/type:** .dot.

**Purpose:** Architecture or lineage diagram source/render used for documentation evidence; create from verified architecture text and never fabricate execution results.

**Creation/ownership route:** Use the Phase 1 folder/file tutorial: create the parent only when needed, create the exact file-name in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified

work.

**Dependencies:** Follow the phase order and do not create this path before its first real input exists.

**Verification:** Confirm exact path, extension, expected producer/editor, content shape, non-secret status, and Git behavior. For generated content, compare manifest/checksum or export source rather than hand-editing it.

**If missing:** The related test, transformation, documentation, job, report, or reproducibility claim is incomplete; investigate the producer and phase gate rather than inventing an empty placeholder.

**If already present:** Preserve and inspect it. Compare current Git history and contents with the workbook before replacing anything.

**Detailed route:** This responsibility card is the construction record for a support/generated file not treated as a core hand-written source file.

## File responsibility 52 — docs/risk\_register.md

---

**Phase introduced:** Phase 3.

**Parent folder:** docs.

**Extension/type:** .md.

**Purpose:** Markdown documentation, requirement, mapping, runbook, evidence, or guide.

**Creation/ownership route:** Use the Phase 3 folder/file tutorial: create the parent only when needed, create the exact file-name in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.

**Dependencies:** Follow the phase order and do not create this path before its first real input exists.

**Verification:** Confirm exact path, extension, expected producer/editor, content shape, non-secret status, and Git behavior. For generated content, compare manifest/checksum or export source rather than hand-editing it.

**If missing:** The related test, transformation, documentation, job, report, or reproducibility claim is incomplete; investigate the producer and phase gate rather than inventing an empty placeholder.

**If already present:** Preserve and inspect it. Compare current Git history and contents with the workbook before replacing anything.

**Detailed route:** Detailed file introduction and optional reference answer appear in Phase 3, Lesson 3.3.

[Back to the file responsibility index](#)

## File responsibility 53 — docs/data\_dictionary.csv

---

**Phase introduced:** Phase 4.

**Parent folder:** docs.

**Extension/type:** .csv.

**Purpose:** Structured mapping, definition, metadata, or small fictional data fixture.

**Creation/ownership route:** Build rows in VS Code or a spreadsheet-like editor while preserving UTF-8 CSV structure; validate headers, row counts, duplicates, and Git diff.

**Dependencies:** Follow the phase order and do not create this path before its first real input exists.

**Verification:** Confirm exact path, extension, expected producer/editor, content shape, non-secret status, and Git behavior. For generated content, compare manifest/checksum or export source rather than hand-editing it.

**If missing:** The related test, transformation, documentation, job, report, or reproducibility claim is incomplete; investigate the producer and phase gate rather than inventing an empty placeholder.

**If already present:** Preserve and inspect it. Compare current Git history and contents with the workbook before replacing anything.

**Detailed route:** Detailed file introduction and optional reference answer appear in Phase 4, Lesson 4.3.

## File responsibility 54 — docs/data\_dictionary.md

---

**Phase introduced:** Phase 4.

**Parent folder:** docs.

**Extension/type:** .md.

**Purpose:** Markdown documentation, requirement, mapping, runbook, evidence, or guide.

**Creation/ownership route:** Use the Phase 4 folder/file tutorial: create the parent only when needed, create the exact file-name in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.

**Dependencies:** Follow the phase order and do not create this path before its first real input exists.

**Verification:** Confirm exact path, extension, expected producer/editor, content shape, non-secret status, and Git behavior. For generated content, compare manifest/checksum or export source rather than hand-editing it.

**If missing:** The related test, transformation, documentation, job, report, or reproducibility claim is incomplete; investigate the producer and phase gate rather than inventing an empty placeholder.

**If already present:** Preserve and inspect it. Compare current Git history and contents with the workbook before replacing anything.

**Detailed route:** This responsibility card is the construction record for a support/generated file not treated as a core hand-written source file.

---

**Phase introduced:** Phase 9.

**Parent folder:** databricks/notebooks.

**Extension/type:** .py.

**Purpose:** Python module, script, Databricks source notebook, or automated test.

**Creation/ownership route:** Use the Phase 9 folder/file tutorial: create the parent only when needed, create the exact file-name in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.

**Dependencies:** Follow the phase order and do not create this path before its first real input exists.

**Verification:** Confirm exact path, extension, expected producer/editor, content shape, non-secret status, and Git behavior. For generated content, compare manifest/checksum or export source rather than hand-editing it.

**If missing:** The related test, transformation, documentation, job, report, or reproducibility claim is incomplete; investigate the producer and phase gate rather than inventing an empty placeholder.

**If already present:** Preserve and inspect it. Compare current Git history and contents with the workbook before replacing anything.

**Detailed route:** Detailed file introduction and optional reference answer appear in Phase 9, Lesson 9.3.

**Phase introduced:** Phase 14.

**Parent folder:** docs/images.

**Extension/type:** .mmd.

**Purpose:** Architecture or lineage diagram source/render used for documentation evidence; create from verified architecture text and never fabricate execution results.

**Creation/ownership route:** Use the Phase 14 folder/file tutorial: create the parent only when needed, create the exact file-name in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.

**Dependencies:** Follow the phase order and do not create this path before its first real input exists.

**Verification:** Confirm exact path, extension, expected producer/editor, content shape, non-secret status, and Git behavior. For generated content, compare manifest/checksum or export source rather than hand-editing it.

**If missing:** The related test, transformation, documentation, job, report, or reproducibility claim is incomplete; investigate the producer and phase gate rather than inventing an empty placeholder.

**If already present:** Preserve and inspect it. Compare current Git history and contents with the workbook before replacing anything.

**Detailed route:** This responsibility card is the construction record for a support/generated file not treated as a core hand-written source file.

## File responsibility 134 — docs/images/jobs\_dependency.svg

---

**Phase introduced:** Phase 14.

**Parent folder:** docs/images.

**Extension/type:** .svg.

**Purpose:** Architecture or lineage diagram source/render used for documentation evidence; create from verified architecture text and never fabricate execution results.

**Creation/ownership route:** Generated/exported by the phase tool or preserved from existing work; do not manually type generated bytes. Verify generator/export source, path, size, and content.

**Dependencies:** Follow the phase order and do not create this path before its first real input exists.

**Verification:** Confirm exact path, extension, expected producer/editor, content shape, non-secret status, and Git behavior. For generated content, compare manifest/checksum or export source rather than hand-editing it.

**If missing:** The related test, transformation, documentation, job, report, or reproducibility claim is incomplete; investigate the producer and phase gate rather than inventing an empty placeholder.

**If already present:** Preserve and inspect it. Compare current Git history and contents with the workbook before replacing anything.

**Detailed route:** This responsibility card is the construction record for a support/generated file not treated as a core hand-written source file.

[Back to the file responsibility index](#)

## File responsibility 135 — scripts/loading/load\_gold\_to\_sqlserver.py

---

**Phase introduced:** Phase 15.

**Parent folder:** scripts/loading.

**Extension/type:** .py.

**Purpose:** Python module, script, Databricks source notebook, or automated test.

**Creation/ownership route:** Use the Phase 15 folder/file tutorial: create the parent only when needed, create the exact file-name in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.

**Dependencies:** Follow the phase order and do not create this path before its first real input exists.

**Verification:** Confirm exact path, extension, expected producer/editor, content shape, non-secret status, and Git behavior. For generated content, compare manifest/checksum or export source rather than hand-editing it.

**If missing:** The related test, transformation, documentation, job, report, or reproducibility claim is incomplete; investigate the producer and phase gate rather than inventing an empty placeholder.

**If already present:** Preserve and inspect it. Compare current Git history and contents with the workbook before replacing anything.

**Detailed route:** Detailed file introduction and optional reference answer appear in Phase 15, Lesson 15.3.

[Back to the file responsibility index](#)

## File responsibility 136 — sql/sqlserver/validation/02\_validate\_warehouse.sql

---

**Phase introduced:** Phase 15.

**Parent folder:** sql/sqlserver/validation.

**Extension/type:** .sql.

**Purpose:** SQL definition, transformation pattern, validation query, or analyst query for the named dialect/location.

**Creation/ownership route:** Use the Phase 15 folder/file tutorial: create the parent only when needed, create the exact file-name in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.

**Dependencies:** Follow the phase order and do not create this path before its first real input exists.

**Verification:** Confirm exact path, extension, expected producer/editor, content shape, non-secret status, and Git behavior. For generated content, compare manifest/checksum or export source rather than hand-editing it.

**If missing:** The related test, transformation, documentation, job, report, or reproducibility claim is incomplete; investigate the producer and phase gate rather than inventing an empty placeholder.

**If already present:** Preserve and inspect it. Compare current Git history and contents with the workbook before replacing anything.

**Detailed route:** Detailed file introduction and optional reference answer appear in Phase 15, Lesson 15.3.

## File responsibility 137 — sql/sqlserver/warehouse/01\_create\_warehouse.sql

---

**Phase introduced:** Phase 15.

**Parent folder:** sql/sqlserver/warehouse.

**Extension/type:** .sql.

**Purpose:** SQL definition, transformation pattern, validation query, or analyst query for the named dialect/location.

**Creation/ownership route:** Use the Phase 15 folder/file tutorial: create the parent only when needed, create the exact file-name in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.

**Dependencies:** Follow the phase order and do not create this path before its first real input exists.

**Verification:** Confirm exact path, extension, expected producer/editor, content shape, non-secret status, and Git behavior. For generated content, compare manifest/checksum or export source rather than hand-editing it.

**If missing:** The related test, transformation, documentation, job, report, or reproducibility claim is incomplete; investigate the producer and phase gate rather than inventing an empty placeholder.

**If already present:** Preserve and inspect it. Compare current Git history and contents with the workbook before replacing anything.

**Detailed route:** Detailed file introduction and optional reference answer appear in Phase 15, Lesson 15.3.

**Detailed route:** Detailed file introduction and optional reference answer appear in Phase 15, Lesson 15.3.

[Back to the file responsibility index](#)

## File responsibility 140 — docs/kpi\_definitions.csv

---

**Phase introduced:** Phase 16.

**Parent folder:** docs.

**Extension/type:** .csv.

**Purpose:** Structured mapping, definition, metadata, or small fictional data fixture.

**Creation/ownership route:** Build rows in VS Code or a spreadsheet-like editor while preserving UTF-8 CSV structure; validate headers, row counts, duplicates, and Git diff.

**Dependencies:** Follow the phase order and do not create this path before its first real input exists.

**Verification:** Confirm exact path, extension, expected producer/editor, content shape, non-secret status, and Git behavior. For generated content, compare manifest/checksum or export source rather than hand-editing it.

**If missing:** The related test, transformation, documentation, job, report, or reproducibility claim is incomplete; investigate the producer and phase gate rather than inventing an empty placeholder.

**If already present:** Preserve and inspect it. Compare current Git history and contents with the workbook before replacing anything.

**Detailed route:** Detailed file introduction and optional reference answer appear in Phase 16, Lesson 16.3.

[Back to the file responsibility index](#)

## File responsibility 141 — docs/kpi\_definitions.md

---

**Phase introduced:** Phase 16.

**Parent folder:** docs.

**Extension/type:** .md.

**Purpose:** Markdown documentation, requirement, mapping, runbook, evidence, or guide.

**Creation/ownership route:** Use the Phase 16 folder/file tutorial: create the parent only when needed, create the exact file-name in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.

**Dependencies:** Follow the phase order and do not create this path before its first real input exists.

**Verification:** Confirm exact path, extension, expected producer/editor, content shape, non-secret status, and Git behavior. For generated content, compare manifest/checksum or export source rather than hand-editing it.

**If missing:** The related test, transformation, documentation, job, report, or reproducibility claim is incomplete; investigate the producer and phase gate rather than inventing an empty placeholder.

**If already present:** Preserve and inspect it. Compare current Git history and contents with the workbook before replacing anything.

**Detailed route:** This responsibility card is the construction record for a support/generated file not treated as a core hand-written source file.

## File responsibility 142 — powerbi/measures.dax

---

**Phase introduced:** Phase 16.

**Parent folder:** powerbi.

**Extension/type:** .dax.

**Purpose:** Power BI DAX measure definitions.

**Creation/ownership route:** Use the Phase 16 folder/file tutorial: create the parent only when needed, create the exact file-name in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.

**Dependencies:** Follow the phase order and do not create this path before its first real input exists.

**Verification:** Confirm exact path, extension, expected producer/editor, content shape, non-secret status, and Git behavior. For generated content, compare manifest/checksum or export source rather than hand-editing it.

**If missing:** The related test, transformation, documentation, job, report, or reproducibility claim is incomplete; investigate the producer and phase gate rather than inventing an empty placeholder.

**If already present:** Preserve and inspect it. Compare current Git history and contents with the workbook before replacing anything.

**Detailed route:** Detailed file introduction and optional reference answer appear in Phase 16, Lesson 16.3.

[Back to the file responsibility index](#)

## File responsibility 143 — powerbi/semantic\_model.md

---

**Phase introduced:** Phase 16.

**Parent folder:** powerbi.

**Extension/type:** .md.

**Purpose:** Markdown documentation, requirement, mapping, runbook, evidence, or guide.

**Creation/ownership route:** Use the Phase 16 folder/file tutorial: create the parent only when needed, create the exact file-name in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.

**Dependencies:** Follow the phase order and do not create this path before its first real input exists.

**Verification:** Confirm exact path, extension, expected producer/editor, content shape, non-secret status, and Git behavior. For generated content, compare manifest/checksum or export source rather than hand-editing it.

**If missing:** The related test, transformation, documentation, job, report, or reproducibility claim is incomplete; investigate the producer and phase gate rather than inventing an empty placeholder.

**If already present:** Preserve and inspect it. Compare current Git history and contents with the workbook before replacing anything.

## File responsibility 160 — tests/integration/test\_repository\_contract.py

---

**Phase introduced:** Phase 19.

**Parent folder:** tests/integration.

**Extension/type:** .py.

**Purpose:** Python module, script, Databricks source notebook, or automated test.

**Creation/ownership route:** Use the Phase 19 folder/file tutorial: create the parent only when needed, create the exact file-name in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.

**Dependencies:** Follow the phase order and do not create this path before its first real input exists.

**Verification:** Confirm exact path, extension, expected producer/editor, content shape, non-secret status, and Git behavior. For generated content, compare manifest/checksum or export source rather than hand-editing it.

**If missing:** The related test, transformation, documentation, job, report, or reproducibility claim is incomplete; investigate the producer and phase gate rather than inventing an empty placeholder.

**If already present:** Preserve and inspect it. Compare current Git history and contents with the workbook before replacing anything.

**Detailed route:** Detailed file introduction and optional reference answer appear in Phase 19, Lesson 19.3.

## File responsibility 161 — datasets/README.md

---

**Phase introduced:** Phase 20.

**Parent folder:** datasets.

**Extension/type:** .md.

**Purpose:** Markdown documentation, requirement, mapping, runbook, evidence, or guide.

**Creation/ownership route:** Use the Phase 20 folder/file tutorial: create the parent only when needed, create the exact file-name in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.

**Dependencies:** Follow the phase order and do not create this path before its first real input exists.

**Verification:** Confirm exact path, extension, expected producer/editor, content shape, non-secret status, and Git behavior. For generated content, compare manifest/checksum or export source rather than hand-editing it.

**If missing:** The related test, transformation, documentation, job, report, or reproducibility claim is incomplete; investigate the producer and phase gate rather than inventing an empty placeholder.

**If already present:** Preserve and inspect it. Compare current Git history and contents with the workbook before replacing anything.

**Detailed route:** This responsibility card is the construction record for a support/generated file not treated as a core hand-written source file.

[Back to the file responsibility index](#)

## File responsibility 162 — docs/claim\_to\_evidence\_map.md

---

**Phase introduced:** Phase 20.

**Parent folder:** docs.

**Extension/type:** .md.

**Purpose:** Markdown documentation, requirement, mapping, runbook, evidence, or guide.

**Creation/ownership route:** Use the Phase 20 folder/file tutorial: create the parent only when needed, create the exact file-name in VS Code or PowerShell, build content in explained sections, save, validate, inspect Git diff, and commit only verified work.

**Dependencies:** Follow the phase order and do not create this path before its first real input exists.

**Verification:** Confirm exact path, extension, expected producer/editor, content shape, non-secret status, and Git behavior. For generated content, compare manifest/checksum or export source rather than hand-editing it.

**If missing:** The related test, transformation, documentation, job, report, or reproducibility claim is incomplete; investigate the producer and phase gate rather than inventing an empty placeholder.

**If already present:** Preserve and inspect it. Compare current Git history and contents with the workbook before replacing anything.

**Detailed route:** Detailed file introduction and optional reference answer appear in Phase 20, Lesson 20.3.

## File responsibility 165 — docs/images/screenshots/.gitkeep

---

**Phase introduced:** Phase 20.

**Parent folder:** docs/images/screenshots.

**Extension/type:** (no extension).

**Purpose:** Placeholder that allows Git to retain an otherwise empty directory; remove only when a real tracked file makes it unnecessary.

**Creation/ownership route:** Create only when the folder must exist before a real tracked file; verify with Git status and remove after a meaningful tracked child exists.

**Dependencies:** Follow the phase order and do not create this path before its first real input exists.

**Verification:** Confirm exact path, extension, expected producer/editor, content shape, non-secret status, and Git behavior. For generated content, compare manifest/checksum or export source rather than hand-editing it.

**If missing:** The related test, transformation, documentation, job, report, or reproducibility claim is incomplete; investigate the producer and phase gate rather than inventing an empty placeholder.

**If already present:** Preserve and inspect it. Compare current Git history and contents with the workbook before replacing anything.

**Detailed route:** This responsibility card is the construction record for a support/generated file not treated as a core hand-written source file.

# Final definition of done

[Back to the master table of contents](#)

Do not fill these statuses automatically. For every row, require: object exists; you personally created/configured it; code was reviewed; command/run occurred; output was inspected; tests passed; error handling was checked; screenshot exists; Git commit exists; remote branch contains the work; documentation is accurate; no credentials are committed; and you can explain it in your own words.

## Repository and environment audit

demo_queries	[ ]	[ ]	[ ]	[ ]	[ ]	[ ]	[ ]	[ ]	[ ]	[ ]

## Cross-layer reconciliation audit

Boundary	Count reconciled	Amount/quantity reconciled	Checksum/manifest verified	Batch/run identified	Difference explained	Status
Generator → source databases	[ ]	[ ]	[ ]	[ ]	[ ]	[STATUS]
Source databases → local extracts	[ ]	[ ]	[ ]	[ ]	[ ]	[STATUS]
Extracts → Bronze	[ ]	[ ]	[ ]	[ ]	[ ]	[STATUS]
Bronze → Silver accepted/rejected	[ ]	[ ]	[ ]	[ ]	[ ]	[STATUS]
Silver → Gold dimensions/facts	[ ]	[ ]	[ ]	[ ]	[ ]	[STATUS]
Gold → exported files	[ ]	[ ]	[ ]	[ ]	[ ]	[STATUS]
Exported files → SQL Server warehouse	[ ]	[ ]	[ ]	[ ]	[ ]	[STATUS]
SQL Server warehouse → Power BI	[ ]	[ ]	n/a	[ ]	[ ]	[STATUS]

## Security, cost, CI, and documentation audit

- ☐ .env and live credentials are untracked and absent from history/evidence.
- ☐ Secret scanning and ignored-file checks pass.
- ☐ Databricks compute was stopped when not needed and cost-sensitive settings were reviewed.
- ☐ GitHub Actions ran on the intended branch/event and every log was read.
- ☐ A controlled CI failure was diagnosed, fixed, and rerun.
- ☐ README claims link to real evidence and use honest status words.
- ☐ Screenshots are redacted, named, committed deliberately, and placed in relevant sections.
- ☐ Architecture diagrams match the implemented path and show manual Track A boundaries.
- ☐ Limitations include synthetic data, batch latency, manual handoffs, tier variance, and infrastructure-free CI scope.
- ☐ Resume/LinkedIn/interview statements do not describe planned or reference code as completed work.

## Final user sign-off

**Date:** [ENTER]  
**Verified branch:** [ENTER]  
**Latest verified commit:** [ENTER]  
**Verified Databricks Job run ID:** [ENTER]  
**Verified publication batch ID:** [ENTER]  
**Power BI file/project path:** [ENTER]  
**Outstanding troubleshooting items:** [ENTER OR NONE]

**Statement in my own words:** [EXPLAIN THE FULL SYSTEM FROM SOURCE TO CONSUMPTION, INCLUDING TWO TRADEOFFS AND ONE FAILURE YOU FIXED]

# Final portfolio and interview audit

[Back to the master table of contents](#)

## Thirty-second explanation worksheet

**Business problem:** [ENTER]  
**Sources:** [ENTER]  
**Pipeline:** [ENTER]  
**Warehouse/semantic model:** [ENTER]  
**Quality evidence:** [ENTER]  
**Honest status/limitation:** [ENTER]

## Two-minute architecture explanation worksheet

Use: requirement → source placement → extraction/batch evidence → Bronze → Silver → Gold → quality gates → Job → warehouse publication → Power BI → Git/CI → limitation/next scale step.  
[WRITE AND PRACTICE YOUR ANSWER]

## Defend-every-decision worksheet

Decision	Alternatives	Why selected	Tradeoff	Evidence	What changes at 100× scale

Infrastructure-free CI	[ENTER]	[ENTER]	[ENTER]	[ENTER]	[ENTER]

## Truthful résumé bullet gate

A bullet may use a completed-action verb only when the referenced component is VERIFIED BY USER and the claim-to-evidence map points to a real commit plus execution evidence. Planned or reference-only work must be described as planned, designed, prototyped, or omitted until verified.

## Final safe stopping point

The required path is complete only after every applicable definition-of-done row is manually updated. Preserve the verified branch and evidence. Optional extensions must begin from a new branch or isolated environment with prerequisites, cost, rollback, and success criteria written before implementation.
